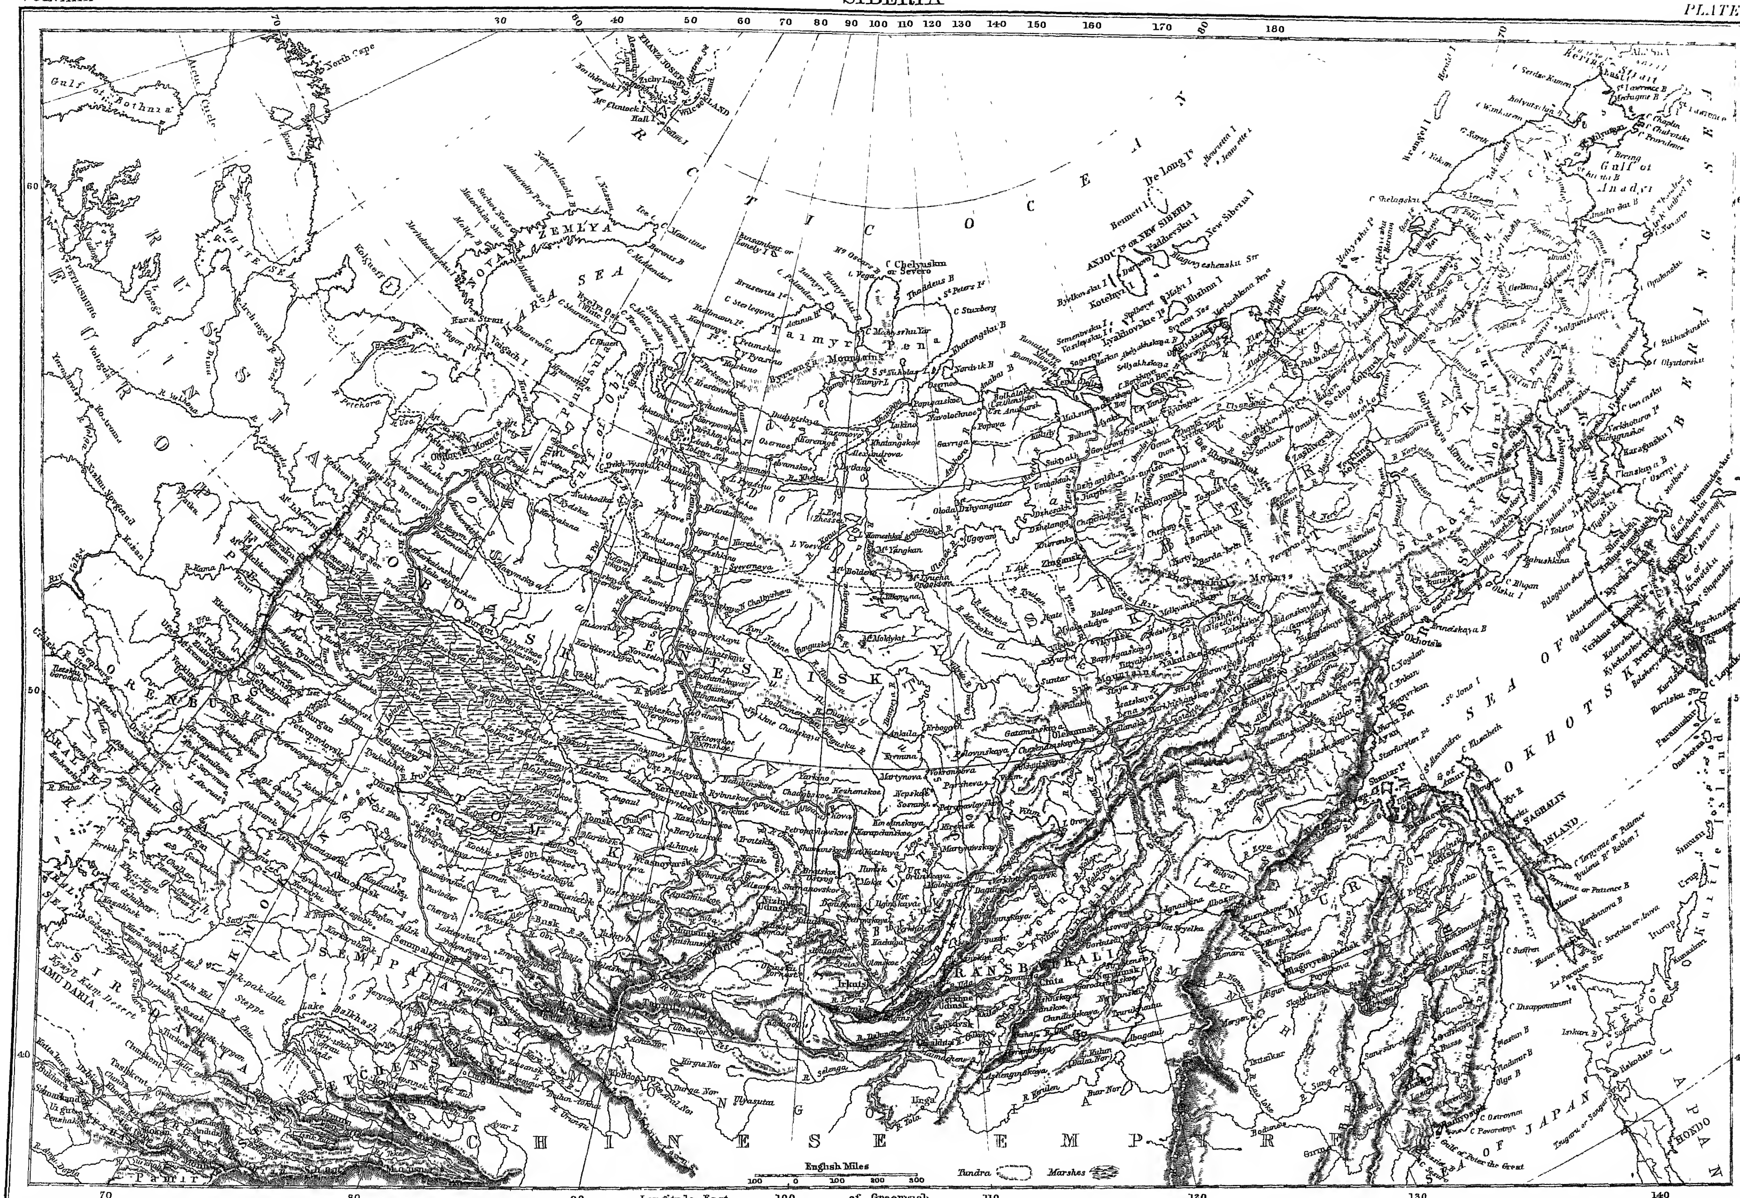
SIBERIA



ENCYCLOPÆDIA BRITANNICA NINTH EDITION

ENCYCLOPÆDIA BRITANNICA.

SIBBALD, SIR ROBERT (1641-1712), may be considered as the most eminent representative of science and medicine in Scotland towards the close of the 17th century. He was born near Leslie in Fifeshire in 1641. Educated at Edinburgh, Leyden, and Paris, he settled as a physician in Edinburgh and soon rose to eminence. His career is one of marked initiative: he was the first professor of medicine in the university of Edinburgh, and the first president of the college of physicians, and, along with Sir Andrew Balfour, founded the botanic garden. He was also geographer-royal, and his numerous and miscellaneous writings deal effectively with historical and antiquarian as well as botanical and medical subjects. He died in 1712.

Amongst Sibbald's historical and antiquarian works may be mentioned *A History of Fife and Kinross* (Edinburgh, 1710, and Cupar, 1803), which is still indispensable to the student of local history and antiquities, *An Account of the Scottish Atlas* (folio, Edinburgh, 1683), *Vindiciæ Scoticæ Illustratæ* (folio, Edinburgh, 1710), and *Description of the Isles of Orkney and Shetland* (folio, Edinburgh, 1711 and 1845). See also his *Autobiography* (Edinburgh, 1833), to which is prefixed an account of his MSS.

Plate I.

Name and extension.

SIBERIA (Russ. *Sibir*, a word of unknown origin, probably Permian) in the 16th century indicated the chief settlement of the Tatar khan Kutchum,—Isker on the Irtish. Subsequently the name was extended so as to include the whole of the gradually increasing Russian dominions in Asia, and in the first half of the 19th century it was applied to the immense region stretching from the Ural Mountains to the Pacific, and from the Arctic Ocean to the Chinese frontier and the Kirghiz steppes. This region, however varied in its separate parts, constituted a geographical whole having its own characteristic physical features. The division into Western and Eastern Siberia which naturally came into general use had also a geographical meaning. In 1856, after the annexation of the Amur and Usuri regions, Eastern Siberia was extended so as to include the Russian dominions on the Pacific, although these latter in reality belong climatically and physically to a quite separate region,—that of the North Pacific littoral; and, as the Russian dominions extended into the Kirghiz steppes, these last were also reckoned to Siberia, although mostly belonging in their physical features to another geographical domain,—the Aral-Caspian depression. Later on these steppes were transferred to the "Orenburg region," or to the "steppe region", but, on the other hand, some districts which really belong to Western Siberia were included under this new denomination. What is now called "Siberia" has thus lost its geographical unity. There still remains, however, for the geographer a vast tract of northern Asia which might be included under this general name, as representing some special features characteristic of the region. It would be limited by the Ural Mountains on the west, by the Arctic and North Pacific Oceans on the north and east respectively, and on the south by a line broadly corresponding to the 50th degree of latitude, running from the sources of the river Ural to the Tarbagatai range (thus separating the steppes of the Irtish basin from those of the Aral and Balkash basins), thence along the Chinese frontier as far as the south-east corner of Transbaikalia, whence it might be drawn to the Great Khingan, and along it to the upper Zeya (tributary of the Amur) and Udskoi Ostrog on the Sea of Okhotsk. This wide area would be naturally subdivided into Western Siberia (basins of the Ob and Irtish) and Eastern Siberia (the remainder of the region). Western Siberia would include the governments of Tobolsk and Tomsk, as well as the parts of Perm situated to the east of the Ural Mountains, and those northern parts of Semipalatinsk which belong to the basins of the Irtish and the Tobol[1], while Eastern Siberia would include the governments of Yeniseisk and Irkutsk, the provinces of Yakutsk and Transbaikalia, together with the north-western part of the province of Amur and the northern parts of the Maritime Province. In fact, the north-western parts of Manchuria situated between the Arguñ and the Great Khingan, as well as the upper parts of the Selenga and the Yenisei (Shishkit) belonging to Mongolia, are so intimately connected with Eastern Siberia as regards their physical features that it is difficult for the geographer to separate them.

Administrative divisions.

Since the inclusion of Uralsk, Turgai, Akmolinsk, and Semipalatinsk within the governor-generalship of the steppes, the present administrative subdivisions stand as follows:—

[1] This natural subdivision has been adopted by P. Semenoff in his valuable sketch of Western Siberia in *Picturesque Russia* (Jivopisnaya Rossiya), vol. xi.

	Area Square Miles	Population	Pop per Square Mile
Tobolsk	531,982	1,283,168	2 4
Tomsk	329,039	1,134,748	3 4
Western Siberia[1]	861,021	2,417,916	2 8
Yeniseisk	992,870	421,010	42
Irkutsk	309,190	398,873	1 2
Yakutsk	1,517,127	243,443	16
Transbaikalia	240,781	497,760	2 1
Eastern Siberia[1]	3,059,968	1,561,086	51
Amur	173,559	40,533	23
Maritime Province	730,022	74,000	10
Amur[1]	903,581	114,533	12
Total	4,824,570	4,093,535	85

General description

It is evident that a territory so immense—covering more than 25 degrees of latitude and 120 degrees of longitude—must include a great variety of orographical and climatological characters, and that the popular conception which persists in representing Siberia as a snow-clad desert is erroneous In fact—not to speak of the rich prairies of the middle Amur and the Usuri region, where the wild vine grows freely—we find in Siberia proper the very fertile black earth prairie steppes, or rather pampas, of the Tobol and Ishim,—not mere patches of fertile land, but plains covering some 25,000,000 acres and ready to receive millions of inhabitants, the highlands of the Altai, with their rich valleys, alpine lakes, glaciers, and snow-clad peaks, —a country three times as large as Switzerland and presenting almost the same variety of aspects, the high plains of Eastern Siberia, where water-melons are grown in the fields during the short but hot summer, the rich steppes of Minusinsk, profusely adorned with flowers, the lower plateaus of Transbaikalia, embellished with the beautiful Daurian flora and supplying food to hundreds of thousands of cattle, the high inhospitable marshy plateaus of the Selenga and Vitim, vast hilly tracts densely covered with forests, and visited only by hunters and gold-diggers, and beyond these the frozen *tundras* of the north,—all these constitute an immense world, with the most striking contrasts of scenery and vegetation, of manners and customs In one direction only is the popular conception true throughout its extension Siberia is the coldest country of the world in consequence of its protracted and exceedingly severe winter This variety of characters will be best understood from the following brief sketch of the orography

Orography

The leading features of the orography of Siberia are so much at variance in our best maps that a few words are necessary to explain the views taken in what follows The inhabited districts are well laid down, but the immense areas between and beyond these have only been visited by geographers and are mapped only along a few routes hundreds of miles apart The intermediate spaces are filled according to information derived from native hunters With regard to a great many rivers we know only the position of their mouths and their approximate lengths estimated by natives in terms of a day's march Even the hydrographical network is very imperfectly known, especially in the uninhabited hilly tracts[2] The orographical representation of Siberia is nothing more than a combination of a few surveys and journeys, in which conscious or unconscious hypothesis is resorted to in order to connect the isolated facts As soon as the river systems of Siberia began to be approximately known, chains of mountains were drawn in all hilly tracts,—higher ones on the chief watersheds and lower ones along the secondary ones This representation conveyed quite a false idea as to the surface configuration of Siberia The immense plateaus which play so predominant a part in the structure of Asia (as they also do in the western parts of North America) were quite overlooked Chains of mountains were drawn as if they rose in the midst of plains, where in reality we have either the slopes of one side of the plateaus or border-chains Lofty mountains appeared where none exist, as, for instance, in those parts of Yakutsk where tributaries of the Lena and the Amur start from common marshes, and some of the highest chains were represented as minor upheavals because they are pierced by rivers descending from the high plateaus to the lowlands It was only by making use of rich unpublished collections of barometrical observations for the calculation of hundreds of heights that many sections of Siberia could be drawn,[3] and by going into a minute study of topographical materials scattered through the bulky literature of Siberia and certain MS field books—the whole controlled by personal journeys—that it became possible to arrive at the following general conclusions as to the structure of the country, which may be of service until more complete surveys shall have given more reliable data[4] This study has shown how predominant has been the part played in the formation of Siberia by huge swellings of the earth's crust (plateaus), and how subordinate that played by isolated chains of mountains, which latter are regulated in their direction in north-eastern Asia by the border ridges of the plateaus, and it has enabled us to make out a close connexion between the structure of Central Asia and Tibet and that of north-eastern Asia, and to establish a link between the two

Great plateau

A vast plateau, beginning in the south at the foot of the gigantic semicircular border range of the Himalayas, and having the lofty plateau of Pamir in the west and the little-known high tracts of the upper Hoang-ho and Yang tse-kiang in the east, extends towards the north eastern extremity of Asia Broadly speaking, it has the shape of a South America pointed towards Behring Strait It attains a width of no less than 1800 miles and an altitude of from 11,000 to 14,000 feet in the south, but both width and altitude diminish towards the north-east In north-west Mongolia the average height is but 4000 to 5000 feet, and this diminishes to 3500 feet in the Vitim plateau, while its width is not more than 700 miles in the latitude of Lake Baikal On the 50th parallel of latitude there occurs in the plateau a broad lateral indentation, occupied by Lake Baikal and the plains of Kansk, and this renders the resemblance of the plateau to South America still more striking This immense plateau is the remainder of a vast and very old continent, which, so far as we know, has not been submerged since at least the Devonian period[5] It extends from the Himalayas to the land of the Tchuktchis, but does not of course present a plane surface of the same altitude in all its parts It is diversified in the following ways (1) Like other plateaus, it has on its surface a number of gentle eminences (*angehaufte Gebirge* of Ritter), which, although reaching great absolute heights, are relatively low These chains for the most part follow a north-easterly direction in Siberia, but in the southern parts of the plateau, as we approach the Himalayas, they seem to assume a direction at right angles (towards the north-west) (2) On the outskirts of the plateau there are several excavations which can best be likened to gigantic trenches, like railway cuttings when with an insensible gradient a higher level has to be reached These trenches for successive geological periods have been the drainage valleys of immense lakes (probably also of glaciers) which formerly spread over the plateau, or fiords of the seas which surrounded it Now the chief commercial routes have been made to follow these trenches to reach the higher level of the plateau Their steep excavated sides, which have the appearance of chains of mountains to the traveller who follows the bottom of the trench, have often been described as such, in reality they are merely unilateral slopes, which may best be compared with the steep slope of the Jura turned towards the Lake of Geneva We have examples of such trenches in the valley of the Uda to the east of Lake Baikal (route to the Amur), in the valley of the Orkhon, leading to Urga and Mongolia (route to Peking), with a branch up the Djida, in the broad depression of the Ulungur leading from Lake Zaisan to Barkul, and in a few others which have been utilized as

[1] Governor generalships

[2] The wide area between the middle Lena and the Amur, as well as the hilly tracts west of Lake Baikal, the Yeniseisk mining region, and many others, are in this condition An instance of a map distinguishing between surveys and information derived from natives is given on a cartoon of map 4 of *Mem Russ Geogr Soc*, General Geography, vol iii

[3] A catalogue of heights in East Siberia is given in the appendix to the present writer's "Report on the Olekma and Vitim Expedition" (*Mem Russ Geogr Soc*, General Geography, vol iii, 1873), also in *Petermann's Mitth*, 1872 The height of Irkutsk, taken as a basis for the catalogue, has been determined since that date by a levelling through Siberia at 1486 feet

[4] "General Sketch of the Orography of Siberia," with map and sections, and "Sketch of the Orography of Minusinsk, &c," by the same writer (same series, vol v, 1875) The views taken in these writings have been embodied by A Petermann in his map of Asia, sheet 58 of Stieler's *Hand Atlas*

[5] The great plateau of North America, also turning its narrower point towards Behring Strait, naturally suggests the idea that there was a period in the history of our planet when the continents turned their narrow extremities towards the northern pole, as now they turn them towards the southern

routes from the Lena to the Sea of Okhotsk (3) There are, moreover, two terraces in the plateau,—a higher and a lower, which are very well pronounced in TRANSBAIKALIA (*q v*) and in Mongolia The Yablonovoi range and its south-western continuation the Kentei are border ridges of the upper terrace Both rise very gently above it, but have steep slopes towards the lower terrace, which is occupied by the Nertchinsk steppes in Transbaikalia and by the Gobi in Mongolia (2000 to 2500 feet above the sea) They rise to from 5000 to 7000 feet above the sea, the peak of Sokhondo in Transbaikalia reaches nearly 8500 feet Several low chains of mountains have their base on the lower terrace and run from south west to north-east, they are known as the Nertchinsk Mountains in Transbaikalia, and their continuations reach the northern parts of the Gobi [1]

Border-ridges of great plateau

The great plateau is fringed on the north west by a series of high border-ridges, which have their southern base on the plateau and their northern at a much lower level They may be traced from the Thian Shan to the arctic circle, and have an east north easterly direction in lower latitudes and a north-easterly direction farther north Both the Alai ridge of the Pamir, continued by the Kokshaltau range and the Khan Tengri group of the Thian-Shan, and the Sailughem range of the Altai (see TOMSK), which is continued, in the opinion of the present writer, in the yet unnamed border-ridge of West Sayan (between the Bei-khem and the Us),[2] belong to this category There are, however, in these border-ridges several breaches of continuity,—broad depressions or trenches leading from Lake Balkash and Lake Zaisan to the upper parts of the plateau On the other hand, there are on the western outskirts of the plateau a few mountain chains which take a direction at right angles to the above (that is, from the north-west to the south east), and parallel to the great line of upheavals in south-west Asia The Tarbagatai Mountains, on the borders of Siberia, as well as several chains in Turkestan, are instances of these upheavals But, notwithstanding these complications, it remains certain that the Alai Mountains, the Khan-Tengri group, the Sailughem range, and the West Sayan are border ridges of the high plateau fringing it from 70° to 100° E long These border-ridges contain the highest peaks of their respective regions, they are immense walls which render access to the high plateau extremely difficult, unless the traveller follows the above mentioned trenches Beyond 100° E long the above structure is complicated by the great lateral indentation of Lake Baikal But around and beyond this lake we again find the same huge border-ridge fringing the plateau and turning its steep north western slope towards the valleys of the Irkut, the Barguzin, the Muya, and the Tchara, while its southern base lies on the plateaus of the Selenga (nearly 4000 feet high) and the Vitim (see TRANSBAIKALIA) The peaks of the Sailughem range reach from 9000 to 11,000 feet above the sea, those of West Sayan about 10,000 In East Sayan is Munku-Sardyk, a peak 10,000 feet high, together with many others from 8000 to 9000 feet Farther east, on the southern shore of Lake Baikal, Khamar daban rises to 6900 feet, and the huge dome-shaped, bald summits of the Barguzin and Southern Muya Mountains attain an elevation of 6000 to 7000 feet above the sea-level The orography of the Aldan region is but little known, but travellers who journey from the Aldan (tributary of the Lena) to the Amur or to the Sea of Okhotsk have to cross the same plateau and its border-ridge, the former becoming narrower and barely attaining an average altitude of 3200 feet Whether it projects farther into the land of the Tchuktchis remains unsettled, although the probability is that it does

Longitudinal valleys

A typical feature of the north-eastern border of the high plateau is a succession of broad longitudinal [3] valleys along its outer base, shut in on the outer side by walls of wild mountains having a very steep slope towards them Formerly filled with alpine lakes, these valleys have now a flat alluvial soil occupied by human settlements, and are watered by rivers which flow along them before they make their way to the north through narrow gorges pierced in the mountain-wall just mentioned This structure is seen in the valley of the Us in West Sayan, in that of the upper Oka and Irkut in East Sayan, in the valley of the Barguzin, the upper Tsipa, the Muya, and the Tchara, at the foot of the Vitim plateau, as also, probably, in the Aldan [4] The chains of mountains which fringe these valleys on the north-west belong to the wildest parts of Siberia They are named the Usinsk Mountains in West Sayan and the Tunka Alps in East Sayan, the latter, pierced by the Angara at Irkutsk, in all probability are continued north-eastwards in the Baikal Mountains, which run from Irkutsk to Olkhon Island and the Svyatoi Nos peninsula of Lake Baikal, thus dividing the lake into two parts, the great and the little [5] The Barguzin Mountains (on the right bank of the Barguzin river) and the Northern Muya range continue them farther to the north east, and most probably they are prolonged still farther on the left bank of the Aldan

Alpine region

A strip of alpine region, 100 to 150 miles in breadth, fringes the north-western border of the plateau beyond the ridges just mentioned This constitutes what is called in Eastern Siberia the *taiga* it consists of separate chains of mountains whose peaks rise from 4800 to 6500 feet above the sea, beyond the upper limits of forest vegetation (the *goltsy*), while the narrow valleys afford difficult means of communication, their floors being thickly covered with boulders or else swampy, the whole is clothed with thick impenetrable forests The orography of this alpine region is very imperfectly known, but the chains have a predominant direction from south-west to north east They are described under different names in Siberia —the Altai Mountains (see TOMSK) in Western Siberia, which also belong to this category, the Kuznetskiy Ala-tau and the Us and Oya Mountains in West Sayan (see YENISEISK), the Nijne-Udinsk *taiga* or gold mine district, several chains pierced by the Oka river, the Kitoi Alps in East Sayan, the mountains of the upper Lena and Kuenga, the Olekminsk gold-mine district, and the yet unnamed mountains which protrude north-east between the Lena and the Aldan

Elevated plains

A broad belt of elevated plains, ranging between 1200 and 1700 feet above the sea, extends beyond these alpine regions These plains, which are entered by the great Siberian highway about Tomsk[6] and extend farther in a south westerly direction, fringing the Altai Mountains, are the true abodes of Russian colonizers, they are fertile for the most part, although sometimes dry, and are rapidly being covered with Russian villages About Kansk in Eastern Siberia they penetrate in the form of a broad gulf south-eastwards as far as Irkutsk Those on the upper Lena, having a somewhat greater altitude and being situated in higher latitudes, are almost wholly unfitted for agriculture The north-western border of these elevated plains cannot yet be determined with exactitude In the region between Viluisk (on the Vilui) and Yeniseisk a broad belt of alpine tracts, reaching their greatest elevation in the northern Yeniseisk *taiga* (between the Upper and the Podkamennaya Tunguzka) and continued to the south-west in lower upheavals, separates the elevated plains from the lowlands which extend towards the Arctic Ocean In Western Siberia these high plains seem to occupy a narrower area towards Barnaul and Semipalatinsk, and it is difficult to say whether they are separated by an abrupt slope from the Aral Caspian depression

Northern lowlands

Farther to the north-west, beyond these high plains, we find a broad belt of lowlands extending as far as the Ural Mountains and the Arctic Ocean This vast tract, which is now only a few dozen feet above the sea, and most probably was covered by the sea during the Post-Pliocene period, stretches from the Aral-Caspian depression to the lowlands of the Tobol, Irtish, and Ob, and thence towards the lower parts of the Yenisei and the Lena Only a few separate mountain ranges, like the Byrranga on the Taimyr peninsula, the Syverma Mountains, the Verkhoyansk and the Kharaulakh ranges, diversify the monotonous surface of these lowlands, which are covered with a thick sheet of black earth in the south and assume the character of barren tundras in the north (see TOBOLSK and YENISEISK)

South-eastern slope of plateau

The south-eastern slope of the great plateau of Asia cannot properly be reckoned to Siberia, although parts of the province of Amur and the Maritime Province are situated on it, they have quite a different character, climate, and vegetation, and ought properly to be reckoned to the Manchurian region As already said, we have to the east of the Yablonovoi border ridge the lower terrace of the high plateau, reaching about 2000 to 2500 feet in Transbaikalia and extending farther to the south-west through the Gobi to East Turkestan The south-eastern edge of this lower terrace is fringed by a massive border-ridge—the Khingan—which runs in a north easterly direction from the Great Wall of China to the sources of the Nonni ula The traveller crossing it from the west is hardly aware of its existence, but it has a very steep slope towards the east, and forms a most important boundary for the Manchurian flora, which does not extend over the plateau. The northern parts of the Khingan are quite unexplored, the most northerly point that has been visited is the sources of the Gan, where the present writer crossed it on his way to Mergen, and we have no direct data for determining where it is crossed by the Amur But, considering the structure of the country on the left bank of the Amur, it appears probable that this river crosses it below Albazin (between Tolbuzina and Kuznetsova, where it makes great windings), and the Zeya where it is joined by the Gilui,—

[1] The lower terrace is obviously continued in the Tarim basin of East Turkestan, but in the present state of our knowledge we cannot determine whether the further continuations of the border ridge of the higher terrace (Yablonovoi, Kentei) must be looked for in the Great Altai or in some other range situated farther to the south There may be also a breach of continuity in some depression towards Barkul

[2] See "Orographical Sketch of Minusinsk, &c," *ut supra*

[3] The word "longitudinal" is here used in an orographical not a geological sense Meglitzki in 1856 and recently M Chersky have shown that these valleys are not synclinal foldings of rocks, they seem to be erosion valleys

[4] We do not know at present whether the same structure is exhibited in the Altai at the foot of the Sailughem range The upper Bukhtarma valley seems, however, to belong to the same type

[5] The deep crevice filled up by Lake Baikal would thus appear to be made up of two longitudinal valleys connected together by the passage between Olkhon and Svyatoi Nos

[6] "Levelling of Siberia," in *Izvestia* of the Russian Geogr Soc, vol. xxi

the upper parts of the Zeya flowing on the plateau, while the Ud flows at its base, so that, as shown elsewhere with greater detail,[1] we must admit the Okhotsk coast-range to be a continuation of the Great Khingan. The Stanovoi range was drawn on old maps to connect the Okhotsk range with the Yablonovoi, but the journeys of the great Siberian expedition have shown that in reality no such range exists,—the upper tributaries of the Gilui (tributary of the Amur) and those of the Konam (basin of the Lena) having their sources in common marshes on the plateau.

A narrow alpine region (40 to 50 miles), consisting of a series of short secondary ridges parallel to the border-ridge, fringes this latter on its eastern slope. Two such plications may be distinguished, corresponding on a smaller scale to the belt of alpine tracts fringing the plateau on the north-west. The resemblance is further maintained by a broad belt of elevated plains, ranging from 1200 to 1700 feet, which follow the eastern border of the plateau. The eastern Gobi, the occasionally fertile and occasionally sandy plains between the Nonni and the Sungari, and the rich plains of the Bureya and Selimja in the Amur province belong to this belt, 400 miles in breadth, the surface of which is diversified by the low hills of the Ilkhuri-alin, the Khuluñ, and the Turan. These high plains are bordered on the south east by a picturesque chain of mountains (the Amur gorge of which has been often described),—the Bureya Mountains (also Little Khingan). It extends, with unaltered character, from Moukden and Ghirin (Kirin) to Ulban Bay in the Sea of Okhotsk (close by the Shantar Islands), its peaks covered from top to bottom with a rich forest vegetation rising to a height of 4500 to 6000 feet. A lowland belt about 200 miles broad runs in the same direction from south west to north-east along the outer border of the above chain. The lower Amur occupies the northern part of this broad valley. These lowlands, covered with numberless marshes and lakes, seem to have emerged from the sea at a quite recent geological period, the rivers that lazily flow over their surface are still excavating their valleys. They are shut off from the Pacific by an alpine belt as yet but imperfectly known, in which at least two separate high chains (the Pribrezhnyi and the Tatar) can be distinguished,—their continuations probably appearing in SAGHALIN (*q v*), while Kamchatka contains several chains, the orography of which is almost quite unknown.

Geology The geology of Siberia is still but incompletely known, some detached regions have been explored, while the vast intermediate spaces remain untouched. Viewed broadly,[2] the great plateau with the alpine tracts fringing it on the north-west and south-east is built up of Palæozoic rocks. On the Vitim and Selenga plateaus immense tracts are composed exclusively of granite, grenatite, and syenite, with subordinate layers of gneisses, which very often are mere modifications, more or less stratified, of the granites and syenites. In some of the ridges that run over the surface of the plateau we find a variety of metamorphic slates, with subordinate layers of crystalline limestones. Extensive beds of lava occur in some parts of the plateau, and in the valleys of the rivers layers of Tertiary sands with petrified wood (*Cupressonoxylum aleuticum*). The plateaus of the Vitim and the Selenga are covered with erratic boulders brought from great distances and show unmistakable traces of glaciation, and immense lakes—small in comparison with their former size—and extensive marshes cover large areas. Besides older metamorphic slates and granites, Silurian and most probably Devonian rocks are widely spread on the lower plateau and in the low chains of mountains which rise above its surface. Silver, lead, gold, and iron are found in these mountains, as also precious stones. Jurassic deposits, yielding many species of fossil insects and plants, occupy several large depressions. They are all of fresh-water origin and were deposited in great lakes. Like the Jurassic beds of China and Turkestan, they contain layers of coal. The alpine tracts in the north west of the plateau are built up of granites, syenites, gneisses, and chiefly of metamorphic slates, the age of which cannot yet be precisely ascertained (Laurentian, and possibly also Silurian, or even Devonian). Talc schists, and especially clay slates, both intersected with veins of quartz, have also a very great development here. The alluvial and glacial deposits of the valleys contain a rich percentage of gold, derived from the trituration of the clay slates and their quartz veins. Conglomerates, belonging probably to the Tertiary period, fill several valleys. Unmistakable traces of glaciers have been found in West and East Sayan, as also in the Olekma and Vitim regions. In the Altai the mountains are built up of granites, syenites, and diorites covered with metamorphic slates belonging to the Laurentian, Silurian, Devonian, and Carboniferous periods. The Jurassic strata on the outskirts are all fresh-water deposits and contain coal, as in Eastern Siberia and China. The Ala tau are of more modern origin, containing extensive Jurassic beds, no longer deposited in depressions, but entering into the structure of the hills. The elevated plains of Western and Eastern Siberia have a more varied structure. On the Lena and the Yenisei we find Silurian, Devonian, Carboniferous, and Triassic marine deposits, covered here and there with fresh-water Jurassic. Immense tracts on the upper Lena are covered with horizontal sheets of red sandstone, the age of which is not yet determined, but seems to be Devonian, while in the government of Irkutsk large areas are covered with Jurassic coal-bearing sandstones. The same structure is found on the outskirts of the Altai, the Carboniferous and older slates having depressions covered with horizontal strata of Jurassic coal-bearing sandstones. The hilly tracts which rise amidst the Eastern Siberian plains on the Angara and Yenisei consist also of granites, syenites, and diorites covered with Palæozoic rocks up to the Carboniferous, while Jurassic strata are found in the Vilui Mountains. The broad lowlands of Western Siberia are covered throughout with Post Pliocene deposits which conceal the older rocks,—shells from this period having been found as far south as Omsk (55° N lat). The lowlands and plains of Eastern Siberia exhibit a greater variety of structure,—Carboniferous, Triassic, marine Jurassic, and Chalk deposits being met with both in the deeper ravines and in the few ridges which appear beyond 60° N lat. Extensive layers of fresh-water Tertiary have been found in depressions of the plateau, in some valleys of the alpine region, and in the plains and lowlands.

Glaciation There has been much discussion as to the extent of the glaciers in Siberia during the Glacial period,—the want of polished and scratched surfaces like those of Scandinavia having been urged as proof that they cannot have been considerable. It must nevertheless be held that the high plateau was at one time covered with a vast ice sheet, and that in the alpine regions of the Altai, Sayan, Olekma, and Aldan glaciers had a much greater extension than at present, descending in the valleys to at least a level of 2000 feet above the sea, and covering the subordinate swellings between the mountain ranges. Thick layers of Post-Glacial deposits, indicating a climate somewhat more genial than the present, and containing numberless remains of extinct mammals, are extensively spread both in valleys throughout the lowlands and on the islands of the Arctic Ocean, while in the tundras of the north well preserved carcases of the mammoth and rhinoceros are occasionally found in the frozen soil.

Traces of Palæolithic man have not as yet been met with in Siberia, but relics of the Neolithic period are exceedingly numerous. One may almost say that they have been found wherever they were looked for, especially on the banks of the numberless lakes with which Siberia was dotted during the Lacustrine period (see below).

Volcanoes Volcanic formations, so far as is known, appear chiefly along the north-western border-ridge of the great plateau. Ejections of basaltic lava have been found on the southern slope of this ridge, extending over wide areas on the plateau itself, on a stretch of more than 600 miles,—namely, in East Sayan about Lake Kossogol and in the valley of Tunka (river Irkut), in the vicinity of Selenghinsk, and widely spread on the Vitim plateau (rivers Vitim and Tsipa). Extensive layers of trap cover more than 1200 miles along the Tunguzka, they appear also in the Noril Mountains on the Yenisei, whence they extend towards the Arctic Ocean. Basaltic lavas are also reported to have been found in the Aldan region. On the Pacific slope extinct volcanoes (mentioned in Chinese annals) have been found in the Ilkhuri-alin Hills to the east of Mergeñ.

Minerals The mineral wealth of Siberia is considerable. Gold dust is found in almost all the alpine regions fringing the great plateau, where clay slates, talc slates, and dioritic slates, intersected by quartz veins, make up the bulk of the mountains. The chief gold-mining regions in these tracts are the Altai, the upper (or Nijne-Udinsk) and the lower (or Yeniseisk) *taigas*, and the Olekma region. Gold is found on the high plateau in the basin of the upper Vitim, on the lower plateau in the Nertchinsk district, and on the upper tributaries of the Amur (especially the Oldoi) and the Zeya, in the north-east continuation of the Nertchinsk Mountains. It has been discovered also in the Bureya range, and in its north-east continuation in the Amguñ region. Auriferous sands, but not very rich, have been discovered in the feeders of Lake Khangka and the Suifun river, as also on the smaller islands of the Gulf of Peter the Great. Silver and lead ores are found in the Altai and the Nertchinsk Mountains, as well as copper, cinnabar, and tin. Iron ores are known at several places on the outskirts of the alpine tracts (as about Irkutsk), as well as in the Selenghinsk region and in the Altai. The chief ironworks of the Urals are situated on the Siberian slope (see URAL). Coal occurs in many Jurassic fresh-water basins,—namely, on the outskirts of the Altai, in south Yeniseisk, about Irkutsk, in the Nertchinsk district, at many places in the Maritime Province, and on the island of Saghalin. Beds of excellent graphite have been found in the Kitoi Alps (Mount Alibert) and in the Turukhansk district. Rock-salt occurs in thinner deposits at several places on the Lena and in Transbaikalia, and salt springs are numerous,—those of Ust kut on the Lena and of Usolie near Irkutsk being the chief. A large number of lakes, especially in Transbaikalia and in Tomsk, yield salt. Lastly, from the Altai region, as well as from the Nertchinsk Mountains, precious stones, such as jasper, malachite, beryl, dark quartz, and the like, are exported. The Ekaterinburg

[1] "Orographical Sketch of East Siberia," *ut supra*

[2] For further details, see the descriptions of the different provinces of Siberia

stone-polishing works in the Urals and those of Kolyvañ in the Altai are well known

Rivers

The orography sketched above explains the great development of the river-systems of Siberia and the uniformity of their course The three chief rivers—the Ob, the Yenisei, and the Lena—take their rise on the high plateau or in the alpine regions fringing it, and, after descending from the plateau and piercing the alpine regions, flow for a few thousands of miles over the high plains and lowlands before they reach the Arctic Ocean The three smaller rivers of north-eastern Siberia—the Yana, Indighirka, and Kolyma—have the same general character, their courses being, however, much shorter, as in these latitudes the plateau approaches the Arctic Ocean The Amur, the upper tributaries of which rise in the eastern border ridge of the high plateau, is similar The Shilka and the Argun, which form it, flow first towards the north-east, through the bendings of the lower terrace of the great plateau, from this the Amur descends, traversing the Great Khingan and flowing down the terraces of the eastern slope towards the Pacific A noteworthy feature of the principal Siberian rivers is that each is formed by the junction of a pair of great rivers Examples are the Ob and the Irtish, the Yenisei and the Angara (itself a double river formed by the Angara and the Lower Tunguzka), the Lena and the Vitim, the Argun and the Shilka, uniting to form the Amur, which in its turn receives a tributary as large as itself,—the Sungari Owing to this twofold composition and to the circumstance that, the alpine regions once crossed, their course lies over the high plains and lowlands and crosses the few ridges which rise above the plains (as, for example, the Yenisei below Yeniseisk), instead of following the valleys between them, the rivers of Siberia offer immense advantages for inland navigation, not only in the line of their main direction from north to south but also across it, *i e*, from west to east

Water communication

It is this circumstance that has facilitated the rapid invasion of Siberia by Russian Cossacks and hunters they followed the courses of the double rivers in their advance towards the east, and discovered short portages which permitted them to transfer their boats from the system of the Ob to that of the Yenisei, and from the latter to that of the Lena, a tributary of which—the Aldan—brought them close to the Sea of Okhotsk At the present day steamers ply from Tyumeñ, at the foot of the Urals, to Semipalatinsk on the border of the Kirghiz steppe and to Tomsk in the very heart of Siberia And the time is not far distant when the Ob and the Yenisei, both traversing the high plains on nearly the same level and separated only by low hills, will be connected by a canal, thus permitting steamers to reach Krasnoyarsk and Irkutsk As the population becomes denser no difficulty should be found in connecting some of the navigable tributaries of the Yenisei with one of those of the Lena, for they flow within a short distance from one another on the high plain, and Cossack boats have already been transported from the Yenisei to the Lena An uninterrupted water communication will then have been established from Tyumeñ to Yakutsk, Aldansk, and the gold-mines of the Vitim Owing to the great plateau separating the Lena from the Amur, no easy water communication can be established between the latter and other Siberian rivers The tributaries of the Amur (the Shilka with its affluent the Ingoda) become navigable only on the lower terrace of the plateau But the trench of the Uda to the east of Lake Baikal offers an easy access for a railway up to and across the high plateau, and at the very foot of its eastern border-ridge lie Tchita, whence boats are floated down (in spring) to the Pacific, and Nertchinsk, whence steamers may ply to the mouth of the Amur, as also up the Sungari to Ghirin and up the Usuri to Lake Khangka Unfortunately all the rivers are frozen for many months every year Even in lower latitudes (52° to 55° N) they are ice bound from the beginning of November to the beginning of May[1], while in 65° N lat they are open only for 90 to 120 days, and only for 100 days (the Yenisei) or even 70 days (the Lena) in 70° N lat During the cold winter the smaller tributaries freeze to the bottom, and about 1st January Lake Baikal becomes covered with a solid crust of ice capable of bearing files of loaded sledges

Enumeration of rivers

The chief rivers of Siberia are the following (1) The Ob (Obi) is formed by the confluence of the Biya and the Katuñ (400 miles), both of which rise in the Altai Mountains, it flows north west and north for 2120 miles, past Barnaul, Tomsk, and Narym, and enters the great Ob Bay of the Arctic Ocean Its tributary (2) the Irtish, which joins it in 60° N lat, has an even greater length (2520 miles) It rises in the high plateau, under the name of Black Irtish (500 miles), then, descending from the highlands, it enters Lake Zaisan, whence it flows north and north west, past Semipalatinsk, Omsk, and Tobolsk, to join the Ob It receives a great number of tributaries, the chief being the Tobol, the Ishim, and the Tara Tyumeñ on the last-named will soon be connected by rail with Perm on the Kama, and is already the head of a great line of water communication, navigation is also open to Lake Zaisan and for a considerable distance up the Black Irtish. The chief tributaries of the Ob are the Anui (160 miles), Tcharysh (230), Tom (450), Tchulym (600), Ket (240), and Sosva (200),—all for the most part navigable (3) The Yenisei rises on the high plateau in north-western Mongolia, where it is formed by the confluence of two great rivers—the Shishkit and the Bei khem—and has the name of Ulu-khem After descending the high plateau on the Chinese frontier, it flows north and enters the Arctic Ocean in a deep bay situated close by that of the Ob The area of its basin is estimated at 1,380,000 square miles It receives (4) the Upper Tunguzka or Angara (1100 miles), which itself has a basin of 275,000 square miles, (5) the Podkamennaya Tunguzka, and (6) the Lower Tunguzka The Angara, whose tributaries on the left (Irkut, Oka, and Uda) are each large rivers, flows from Lake Baikal (40 miles above Irkutsk) and, describing a huge bend to the north east, joins the Yenisei a little above Yeniseisk (7) The Selenga, which enters Lake Baikal from the east, might be considered as the real source of the Angara It is a very large river and rises on the high Mongolian plateau, entering Siberia about Kiachta Its length may be estimated at more than 600 miles, it receives (8) the Uri (outflow of Lake Kossogol), (9) the Orkhon, (10) the Tchikoi (300 miles), (11) the Khilok (300), (12) the Uda (130), and (13) the Djida (200) Lake Baikal has two other considerable feeders—the Barguzin and the Upper Angara (14) The Lena is also an immense river, having an estimated length of not less than 3000 miles It rises in the Baikal Mountains, some scores of miles from the lake, and flows north and east past Kirensk, Olekminsk, and Yakutsk Thence it turns to the north-west and enters the Arctic Ocean, forming a wide delta It receives several large tributaries—(15) the Vitim, which has a greater length (about 1400 miles) than the Lena above the point of junction, (16) the Olekma (about 800), (17) the Aldan (about 1300)—which receives in its turn (18) the Utchur (350), (19) the Maya, and (20) the Amga—and (21) the Vilui (about 1300) (22) The Taz (about 750), (23) the Khatanga (400), (24) the Anabara (670), and (25) the Olenek (1200), which enter the Arctic Ocean to the west of the Lena, and (26) the Yana (1000), (27) the Indighirka (950), and (28) the Kolyma (1000) to the east of it are also considerable rivers, but small in comparison with the former (29) The Anadyr enters the gulf of the same name in the Sea of Behring (30) The Okhota (270) and (31) the Ud (350) are relatively small streams flowing into the Sea of Okhotsk Of the rivers flowing to the Pacific the chief is (32) the Amur, which is navigable for more than 2400 miles from its entrance into the Tatar Strait (between the mainland and the island of Saghalin) to Stryetensk on the Shilka,—boats being floated from Tchita on the Ingoda It bears the name Amur after the confluence of (33) the Shilka and (34) the Argun (see TRANSBAIKALIA) at Ust-Stryelka, and from this point flows east and south-east until its junction with its great tributary the Sungari, thence it flows north-east and north, and finally (for some 50 miles) east, before entering the Pacific Its length, taking the Onon for its source, is about 2700 miles, and its basin is at least 785,000 square miles in area, but has diminished recently,—the waters of the Dalai-nor no longer reaching the Argun It receives a great many large tributaries,—(35) the Zeya, whose affluent (36) the Selimja is itself a considerable river, (37) the Bureya, (38) the Kur, (39) the Gorin, and (40) the Im from the left, while from the right it receives (41) the Sungari and (42) the Usuri, whose affluent, the navigable Sungatcha, brings the Amur into steam communication with Lake Khangka The rivers flowing into the Sea of Japan are mostly short, only (43) the Suifun being worthy of particular mention

Numberless lakes occur in both Eastern and Western Siberia Lakes

There are wide areas in the plains of Western Siberia, or on the high plateau of Eastern Siberia, where the country may be said to be still passing through the Lacustrine period, but the total area now under water bears but a trifling proportion to the immense extent which the lakes had even at a very recent period, when Neolithic man already inhabited Siberia All the valleys and depressions bear traces of immense Post Pliocene lakes Even within historical times and during the 19th century the desiccation of lakes has gone on at a very rapid rate[2] The chief lake is Lake Baikal, more than 400 miles long, from 20 to 53 broad, and 12,430 square miles in area Its surface is 1560 feet above sea level, and it reaches in its south-west part a maximum depth of 751 fathoms Another great lake, Lake Kossogol, on the Mongolian frontier, is 120 miles long and 50 broad, 5000 feet above the sea The large Lake of Oron on the Vitim has not yet been visited by geographers Vast numbers of small lakes stud the Vitim and upper Selenga plateaus, the lower valley of the latter river contains the Goose Lake (Gusinoye) In the basin of the Amur are Lake Khangka (1692 square miles), connected with the Usuri, Lakes Kada and Kizi, by which the lower Amur once flowed to the Pacific, and very many smaller ones on the left bank of the lower Amur Numerous lakes and extensive marshes cover the low plains of Western Siberia, the Baraba steppe is dotted with lakes and ponds,—Lake Tchany (1300 square miles) and the innumerable smaller lakes that surround it being but trifling

[1] The Lena at Verkholensk is navigable for 170 days, at Yakutsk for 153 days, the Yenisei at Krasnoyarsk for 180 days, see *Izvestia* of the Eastern Siberian Geographical Society, vol xii *sq*

[2] See Yadrintseff, in *Izvestia* of the Russian Geogr Soc, 1886, No 1 (with maps)

remains of former lacustrine basins, while at the junction of the Irtish and Ob impassable marshes extend for many thousands of square miles Several alpine lakes, of which the picturesque Teletskoye may be specially mentioned, fill up the depressions of the valleys of the Altai

Coasts and islands

The coast-line of Siberia is very extensive both on the Arctic Ocean and on the Pacific The former ocean is ice bound for at least ten months out of twelve, and, though navigation along its shores has been proved by Nordenskjold to be possible, it is exceedingly doubtful whether it can ever become a commercial route of any importance The coast-line has few indentations, the chief being the double bay of the Ob and the Taz, separated from the Sea of Kara by an elongated peninsula (Samoyede), and from the bay of the Yenisei by another The immense peninsula of Taimyr —a barren tundra intersected by the wild Byrranga Hills—projects in Cape Tcheluskin as far north as 77° 46′ N lat The bay of the Yana, east of the delta of the Lena, is a wide indentation sheltered on the north by the islands of New Siberia The bays of the Kolyma, the Tchaun, and Kolutchin are of little importance The group of four larger and several smaller islands called New Siberia, situated off the mouth of the Yana, are occasionally visited by a few hunters, as is also the small group of the Bears' Islands opposite the mouth of the Kolyma Kellett's or Wrangel's Land is still quite unknown The Strait of Behring at the north-east extremity of Siberia and the Sea of Behring between the land of the Tchuktchis and Alaska, with its great Gulf of Anadyr, are often visited by seal-hunters, and the Commander Islands off Kamchatka are valuable stations for this pursuit The Sea of Okhotsk, separated from the Pacific by the Kurile Archipelago and from the Sea of Japan by the islands of Saghalin and Yesso, is notorious as one of the worst seas of the world, owing to its dense fogs and its masses of floating ice The Shantar Islands in the bay of the Ud are worthy of notice only for their geological interest The double bay of Ghijiga and Penjinsk, as well as that of Tauı, would be useful as harbours were they not frozen seven or eight months every year and covered with dense fogs in summer The northern part of the Sea of Japan, which borders the shores of the Usuri region, has, besides the smaller Bays of Olga and Vladimir, the beautiful Gulf of Peter the Great, on which stands Vladivostok, the chief Russian naval station on the Pacific (see MARITIME PROVINCE) Okhotsk and Ayan on the Sea of Okhotsk, Petropavlovsk on the east shore of Kamchatka, Nikolaievsk, Konstantinovsk, and Vladivostok on the Sea of Japan, and Dui and Korsakovo on SAGHALIN (*q v*) are the only ports of Siberia

Climate

Although Siberia is nearly all included between 50° and 72° N lat,[1] its climate is extremely severe, even in its southern parts This severity arises chiefly from the orographical structure the vast plateau of Central Asia prevents the moderating influence of the sea from being felt The extensive lowlands which cover more than one-half of its area, as well as the elevated plains, lie exposed to the influence of the Arctic Ocean The warm south-west winds have to cross the elevated plateau of Persia before reaching the Aral-Caspian depression, and there they deposit nearly all their moisture And, if a current of warmer air flows from the west over Siberia (several data, such as meteorological observations on Mount Alibert and at the Voznesensk mine in the Olekma region render its existence most probable in Eastern Siberia), it only makes its influence felt in the higher parts of the hilly tracts, by raising the line of perpetual snow in Eastern Siberia to the unusual height of 10,000 feet,[2] and by elevating by a few degrees the temperature of places situated in the alpine regions above the 3000 or 4000 feet level The air, after being refrigerated on the plateaus during the winter, drifts, owing to its greater density, down upon the lowlands, hence in the region of the lower Lena we find an exceedingly low temperature throughout the winter, and at Verkhoyansk, in 67° N lat, the pole of cold of the eastern hemisphere [3] Nevertheless Siberia enjoys a warm summer, owing to the dryness of the climate, the unclouded sun fully warms the earth during the long summer days in those high latitudes, and gives a short period of warm and even hot days in the immediate neighbourhood of the pole of cold The Siberian winter may be said to last from the end of October until March, and it is exceedingly severe As early as November mercury freezes in the latitude of Irkutsk (51° to 52° N lat), while in December, January, and even February it remains frozen for weeks together in south Siberia Frosts of −13° to −18° Fahr are not uncommon at Krasnoyarsk, Irkutsk, and Nertchinsk, even in the warmer southern regions of Western Siberia and of the Amur the average winter temperature is respectively 2° 4 Fahr and −10° 2, while at Yakutsk and Verkhoyansk the thermometer occasionally falls as low as −75° and −85° Fahr Trees, as observed by Middendorff, become frozen to their very heart, and the axe, which becomes as fragile as glass, can hardly make any impression upon them Rivers are frozen to the bottom, and water flowing over the ice adds new layers The soil freezes many feet deep over immense areas even in southern Siberia The atmosphere becomes laden with frozen vapours Man, however, successfully resists these rigours, provided he adopts the customary costume of Siberia (two dresses of fur, the upper of which has the hair turned outside), and this all the more as the hardest frosts occur only when an absolute stillness of the air prevails More dreaded than the frosts are the terrible *burans* or snow storms, which occur in early spring and destroy thousands of horses and cattle that have been grazing in the steppes throughout the winter Although there are very heavy falls of snow in the alpine tracts—especially about Lake Baikal—on the other side, in the steppe regions of the Altai and Transbaikalia and in the neighbourhood of Krasnoyarsk, the amount of snow is so small that travellers use wheeled vehicles, and cattle can find food in the steppe Spring sets in with remarkable rapidity and charm at the end of April, but in the second half of May come the "icy saints' days," so blighting that it is impossible to cultivate the apple or pear After this short period of frost and snow summer comes in its full beauty, the days are very hot, and, although they are always followed by cold nights, vegetation advances at an astonishing rate Corn sown about Yakutsk in the end of May is ripe in the end of August Still, at many places night frosts set in as early as the second half of July They become quite common in August and September Nevertheless September is much warmer than May, and October than April, even in the most continental parts of Siberia By the end of October the rivers begin to freeze, and in the first days of November they are all frozen, even the Amur becomes a highway for sledges, while the Baikal is usually frozen before the middle of January The isotherms are exceedingly interesting That of 32° Fahr crosses Western Siberia in its middle parts and Eastern Siberia in its southern parts, running through Bogoslovsk, Tobolsk, a little above Omsk and Tomsk, close by Irkutsk, Tchita, Nertchinsk, Blagovyeschensk, and Konstantinovsk The isotherms of July run as follows That of 68° Fahr, which in Europe passes through Cracow and Kaluga, here traverses Omsk, Krasnoyarsk, and Irkutsk, whence it turns north to Yakutsk, and then south again to Vladivostok Even the mouths of the Ob, Yenisei, Lena, and Kolyma in 70° N lat have in July an average temperature of 40° to 50° Quite contrary is the course of the January isotherms That of 14° Fahr, which passes in Europe through Uleåborg, only touches the southern part of Western Siberia in the Altai Mountains That of −4° Fahr, which crosses Nova Zembla in Europe, passes through Tobolsk, Tomsk, Krasnoyarsk, and Irkutsk, and touches 45° N lat at Urga, turning north in the Amur region and reaching the Pacific at Nikolaievsk The isotherm of −22° Fahr, which touches the north point of Nova Zembla, passes in Siberia through Turukhansk and descends as low as 55° N lat in Transbaikalia, whence it turns north to the Arctic Ocean The following figures will give a more complete idea of the climate —

	N Lat	Height above Sea in Feet	Average Temperature in Degrees Fahr			Yearly Rainfall in Inches	Nebulosity, per-cent
			Year	Jan	July		
Ust Yansk (Yana)	70° 55′	80	3° 4	−42° 7	56° 0		
Verkhoyansk	67° 34′	160	2° 0	−56° 0	59° 8		
Turukhansk	65° 55′	70	20° 8	−16° 1	59° 5		
Berezoff (Ob)	63° 56′	100	23° 7	− 8° 0	62° 0		
Yakutsk	62° 2′	520	12° 0	−46° 7	65° 8		
Okhotsk	59° 21′	10	22° 8	−10° 7	55°·2		
Narym (Ob)	58° 55′	200	28° 5	− 8° 0	67° 1		
Voznesensk mine	58° 45′	2800	21° 8	−12° 5	61° 9		
Yeniseisk	58° 27′	260	28° 0	−12° 0	66 0	15 4	55
Tobolsk	58° 12′	160	31° 9	− 2° 2	66° 7	12 6	59
Tomsk	56° 29′	230	30° 9	− 3° 5	66° 3		59
Ishim	56° 6′	330	31° 9	− 4° 1	66° 0	12 6	59
Krasnoyarsk	55° 1′	560	33° 0	− 3° 5	67° 0		
Barnaul	53° 20′	460	32° 5	− 2° 8	67° 5	9 4	64
Nikolaievsk	53° 8′	70	27° 2	− 9° 8	61° 8	18 9	
Irkutsk	52° 17′	1486	32° 0	− 4° 1	65° 6	17 3	
Nertchinsk mine	51° 19′	2170	25° 3	−21° 0	65° 1	15 4	34
Semipalatinsk	50° 24′	590	36° 2	− 0° 6	72° 5	9 4	
Blagovyeschensk	50° 16′	370	29° 8	−13° 8	69° 1		
Khabarovka	48° 28′	250	32° 1	−12° 8	67° 8		
Urga (Mongolia)	47° 56′	3770	27° 2	−12° 7	62° 6	10 2	30
Vladivostok	43° 7′	100	40° 1	4° 5	67° 8	12 6	42

Flora.

The flora of Siberia presents very great local varieties, not only on account of the diversity of physical characteristics through this wide territory, but also in consequence of the intrusion of new species in various proportions from the neighbouring tracts, as widely different as the arctic littoral, the dry steppes of Central Asia, and the wet monsoon regions of the Pacific littoral A complete description of the flora of Siberia would have to treat of (1)

1 Only the narrow fringe of the tundras extends beyond 70° N lat

2 Although rising to heights ranging from 6000 to 10,000 feet, the mountain peaks of Eastern Siberia do not reach the snow line, which is found only on the Munku Sardyk in East Sayan, above 10,000 feet Patches of perpetual snow occur in Eastern Siberia only on the mountains of the far north On the Altai Mountains the snow line is about 7000 feet

3 The average temperature of winter (December to February) at Yakutsk is −40° 2 Fahr, at Verkhoyansk −53° 1 At the polar meteorological station of Sagastyr, in the delta of the Lena (73° 23′ N lat), the following average temperatures were observed in 1882 and 1883—January −34° 3 Fahr (February −43° 6), July 40° 8, year 2° 1 The lowest average temperature of a day is −61° 6 Fahr

the high plateau; (2) the alpine tracts—(*a*) the Altai and (*b*) East Sayan, with a sub-region to the east of Lake Baikal; (3) the steppe regions of Western Siberia; (4) the Ishim and Baraba plains of the same; (5) the high plains of Eastern Siberia, with the sub-region (6) of Minusinsk; (7) the Daurian flora of the lower terrace of the plateau in Transbaikalia; (8) the Amur; (9) the Usuri and Pacific littoral region; (10) the arctic tundras, which, as shown by the "Vega" expedition, may be subdivided into those (*a*) west of Yenisei and (*b*) east of the same to Behring Strait; and (11) Kamchatka. Each of these has distinct features; nevertheless, if the basin of the Amur and Kamchatka be set aside, all have so much in common that the "Siberian flora" may be spoken of as a whole. Siberia is situated for the most part in the great domain which Grisebach describes as the "forest region of the Eastern continent."[1] The northern limit of this region must, however, be drawn nearer to the Arctic Ocean. Only a narrow strip, 60 to 200 miles wide (becoming broader in the Taimyr and Samoyede peninsulas), is totally devoid of tree vegetation. The last trees, it is true, which struggle for existence on the edge of the tundras are crippled dwarfs and almost without branches; a few buds each summer are the only evidence that life has not left their frozen stems; and trees a hundred years old are only a few feet long and a few inches thick, concealed amidst lichens.[2] Some 200 species of flowering plants are still found in the tundra region,—the frozen ground and the want of humus militating more against them than the want of warmth.[3] From this northern limit to the Aral-Caspian and Mongolian steppes we have all over Siberia the forest region, where, however, forests are very unequally distributed, covering from 50 to 99 per cent. of the areas of the separate districts. In the hill tracts and the marshy depression of the Ob they are unbroken, except by the bald summits of the loftier mountains (*goltsy*); they have the aspect of agreeable bosquets in the Baraba; and they are thinly scattered through the south-eastern corner of Transbaikalia, where the dryness of the Gobi steppe is so much felt, while immense marshy plains covered with the dwarf birch take their place in the north as the tundras are approached. Over this immense area the trees are for the most part the same as we are familiar with in Europe. The larch becomes predominant and presents itself in two new species (*Larix sibirica* and *L. dahurica*). The fir appears in the Siberian varieties *Picea obovata* and *P. ayanensis*. The silver fir (*Abies sibirica*, *Pinus Pichta*) and the stone pine (*P. Cembra*) are quite common; they reach the higher summits, where the last-named becomes a recumbent species (*Cembra pumila*), while the larch and the silver fir also acquire a tendency to spread their side branches instead of rising in height. The willow at high altitudes grows only two inches high, but still bears a few leaves and fully developed flowers. The birch in the loftier alpine tracts and plateaus becomes a shrub (*Betula nana*, *B. fruticosa*), or in Transbaikalia assumes a new and very elegant aspect with a dark bark (*B. dahurica*). In the deeper valleys or on the lowlands of Western Siberia the larches, pines, and silver firs, mixed with birches and aspens, reach a great size, and the streams are fringed with thickets of poplar and willow. The alpine rose (*Rhododendron dahuricum*) flourishes in large masses on the higher mountains; *Juniper*, *Spiræa*, *Sorbus*, the pseudo acacia (*Caragana sibirica* and *arborescens*, *C. jubata* in some of the higher tracts), various *Rosaceæ*—*Potentilla fruticosa* and *Cotoneaster uniflora*—the cherry-plum (*Prunus Padus*), and many other shrubs fill up the spaces between the trees. Berry-yielding plants are found everywhere, even on the *goltsy*, at the upper limit of tree vegetation; on the lower grounds they are an article of diet to the hunter, and even to the agriculturist. The red whortleberry (*Vaccinium Vitis idæa*), the bog whortleberry (*V. uliginosum*), the bilberry or cowberry (*V. Myrtillus*), and the arctic bramble (*Rubus arcticus*) extend very far northwards; raspberries and red and black currants form a rich undergrowth in the forests, together with the *Ribes dikusha* in Eastern Siberia. The oak, the lime, the maple, disappear to the east of the Urals, to reappear, however, in new varieties on the eastern slope of the border-ridge of the great plateau (timidly penetrating west for some little distance up the valleys of the Amur and the Argun).[4] There we have the oak (*Q. mongolica*), the maple (*Acer ginala*, Max.), the ash (*Fraxinus manchurica*), the elm (*Ulmus montana*), the hazel (*Corylus heterophylla*), and several other European acquaintances. Farther east, in the Amur region, a great number of new species of European trees, and even new genera, such as the cork tree (*Phellodendron amurensis*), the walnut (*Juglans manchurica*), the acacia (*Maackia amurensis*), the graceful climber *Maximowiczia amurensis*, the Japanese *Trochostigma*, and many others—all unknown to Siberia proper—make their appearance.

The greatest uniformity prevails on the high plateau, where the larch predominates over all other species of conifers or deciduous trees; the wide and open valleys—or rather shallow depressions—are covered with *Betula nana* and *B. fruticosa* in the north and with thick grasses (poor in species) in its southern and drier parts. The same Siberian larch covers the alpine tracts fringing the plateau on the north, but the tree assumes different characters in development and growth according to the physical features of the region; and the fir, the stone-pine, the aspen, and the birch also become mixed with it. In the narrow sheltered valleys the forests attain their full development. In the drier parts, on the slopes covered with sand or with a richer soil, the Scotch fir (*Pinus sylvestris*) makes its appearance. In the alpine tracts of the north the narrowness of the valleys (*padi*) and the steep stony slopes covered with debris, on which only lichens and mosses can grow, make each green plot of grass (even if it be only of *Carex*) valuable to the gold-diggers and hunters. For days consecutively the horse of the explorer can get no other food than the dwarf birch. But even in these districts the botanist and geographer can easily distinguish between the *tcherñ* of the Altai and the *taiga* of different parts of Eastern Siberia. The lower plateau exhibits, of course, new characteristics. Its open spaces are lovely prairies, on which the Daurian flora appears in its full beauty. In spring the traveller crosses a sea of grass from which the flowers of the pæony, aconite, *Orobus*, *Caralia*, *Saussurca*, and the like rise to a height of 4 or 5 feet. As the Gobi desert is approached the forests disappear, the ground becomes chiefly covered with dry *Gramineæ*, and *Salsolaceæ* make their appearance on a gravelly clay impregnated with salt. The high plains of the west slope of the plateau are also covered with rich prairies diversified with woods. Nearly all the species of these prairies are common also to Europe (pæonies, hemerocallis, asters, pinks, gentians, violets, *Cypripedium*, *Aquilegia*, *Delphinium*, aconites, irises, and so on); but here the plants attain a much larger size,—so large indeed that a man standing erect is concealed by the grasses. The flora of Minusinsk—the Italy of Siberia—is well known; the prairies on the Ishim and of the Baraba (see TOMSK) are adorned with the same rich vegetation, so vividly described by Middendorff and Finsch. Farther north we again reach the domain of forests; but these once more present new characteristics. They are the *urmans* of Western Siberia, into which the hunter does not venture to penetrate far from his village,—immense tracts covered with thickets of trees closely packed and therefore poor in aspect, and often rising from a treacherous carpet of thickly woven grass which conceals deep marshes (*zybuny*), where even the bear has to tread circumspectly. The prairies of the middle Amur and the rich plains of the Selimja and Zeya, where Russian Raskolniks are so successful as agriculturists, belong to Manchuria.

The fauna of Siberia is closely akin to that of central Europe, Fauna and the Ural Mountains, although the habitat of a few species which warrant the naturalist in regarding the south Urals as a separate region, are not so important a boundary zoologically as they are botanically. As in European Russia, so in Siberia, three great zones—the arctic, the boreal, and the middle—may be distinguished; and these, according to M. Syevertsoff,[5] may be subdivided into several sub-regions. The arctic (hyperboreal) zone has the same characters as the tundra zones of European Russia. The boreal (circumboreal) zone, which corresponds to the forest region of Russia, embraces Western Siberia, with the exception of the Urals and the southern steppes, and a notable part of Eastern Siberia,—Transbaikalia and the hilly tracts to the north of it being distinguished as a separate "Eastern Siberian" sub-region. The middle zone, extending from south Russia to south Siberia, has two separate sub-regions,—the Ural-Baraba and the Daurian. The zone of the steppes extends from the Caspian Sea through Central Asia, only touching Western Siberia and the neighbourhood of the Gobi in Transbaikalia. Finally, the Amur region shares the characteristics of the north Chinese fauna. On the whole, we may say that the arctic and boreal faunas of Europe extend over Siberia, with a few additional species in the Ural and Baraba region,—a number of new species also appearing in Eastern Siberia, some spreading along the high plateau and others along the lower plateau from the steppes of the Gobi. The arctic fauna is very poor. According to Nordqvist,[6] it numbers but twenty-nine species of mammals, of which seven are marine and only seventeen or eighteen may be safely considered as living beyond the forest limit. Of these, again, four are characteristic of the land of the Tchuktchis. The wild reindeer, the arctic dog (*Canis lagopus*), the fox, the hare, the wolf, the lemming (*Myodes obensis*), the collar lemming (*Cuniculus torquatus*), and two species of voles (*Arvicolæ*) are the most common on land. The avifauna is very rich in migratory water and marsh

[1] According to Engler's *Versuch einer Entwickelungsgeschichte der Pflanzenwelt* (1879), we should have in Siberia—(*a*) the arctic region; (*b*) the sub-arctic or conifer region,—north Siberian province; (*c*) the Central-Asian domain,—Altai and Daurian hilly regions; and (*d*) the east Chinese, intruding into the basin of the Amur.

[2] Middendorff's observations on vegetable and animal life on the borders of and in the tundras—so attractively told in vol. iv. of his *Sibirische Reise*—will long remain classical.

[3] M. Kjellmann (*Vega Exp. Vet. Iakttagelser*) reckons their number at 182; 124 species were found by Middendorff on the Taimyr peninsula, 219 along the borders of the forest region of Olenek, and 344 species within the forest region of the same; 470 species were collected by M. Maack in the Vilui region.

[4] Nowhere, perhaps, is the change better seen than on crossing the Great Khingan. The change in the flora witnessed by the present writer on his way from Transbaikalia to Mergeñ was really astonishing.

[5] "Horizontal Distribution of Animals," in the Bulletin (*Izvestia*) of the Society of Friends of Natural Science, vol. viii., 1873.

[6] "Anteckningar och Studier," &c., in *Vega Exp. Vet. Iakt.*, vol. ii.

fowl (*Grallatores* and *Natatores*), which come to breed in the coast region, but only five land birds—the ptarmigan (*Lagopus alpinus*), the snow-bunting, the Icelandic falcon, the snow owl, and the raven—are permanent inhabitants of the region. The boreal fauna is of course much richer, but here also the great bulk of species, both of mammals and birds, are common to Europe and Asia. The bear, the badger, the wolverene, the pole-cat, the ermine, the common weasel, the otter, the wolf, the fox, the lynx, the mole, the hedgehog, the common shrew, the water shrew, and the lesser shrew (*Sorex vulgaris, fodiens*, and *pygmæus*), two bats (the long eared and the boreal), three species of *Vespertilio* (*V. daubentonii, nattereri*, and *mystacinus*), the flying and the common squirrel (*Tamias striatus*), the brown, common, field, and harvest mouse (*Mus decumanus, musculus, sylvaticus, agrarius*, and *minutus*), four voles (*Arvicola amphibius, rufocanus, rutilus*, and *schistocolor*), the beaver, the variable hare, the wild boar, the roebuck, the stag, the reindeer, the elk, and the *Phoca annelata* of Lake Baikal,—all these are common alike to Europe and to Siberia, while the bear, the musk-deer (*Moschus moschiferus*), the ermine and the sable, the ground squirrel (*Spermophilus eversmanni*), *Arvicola obscurus*, and *Lagomys hyperboræus*, also spread over Siberia, may be considered as belonging to the arctic fauna. In addition to the above we find in Eastern Siberia *Mustela alpina, Canis alpinus*, the sable antelope (*Ægoceros sibiricus*), several species of mouse (*Mus gregatus, œconomus*, and *saxatilis*), two voles (*Arvicola russatus* and *macrotus*), *Syphneus aspalax*, and the alpine *Lagomys*, which penetrate from the Central Asian plateaus, while the tiger makes incursions not only in the Amur region but occasionally as far as Lake Baikal. In all, of fifty seven species of Siberian mammals forty-one are common also to Europe, twenty seven common to the arctic region, and only sixteen special to Asia. On the lower terrace of the great plateau we find an admixture of Mongolian species, such as *Canis corsac, Felis manul, Spermophilus dauricus*, the jerboa (*Dipus jaculus*), two hamsters (*Cricetus songarus* and *furunculus*), three new voles (*Arvicolæ*), the Tolai hare, the Ogotona hare (*Lagomys ogotona*), *Ægoceros argali, Antilope gutturosa*, and *Equus hemionus* (*jighitai*), while the number of species common to Asia and Europe diminishes notably. The same is true with respect to birds. No less than 285 species have been observed in Siberia, but of these forty-five only are absent from Europe. In south-east Siberia we find forty-three new species belonging to the north Manchurian or Amur fauna, and in south east Transbaikalia, on the borders of the Gobi steppe, only 103 species were found by Radde, among which the most numerous are migratory birds and the birds of prey which pursue them. The rivers and lakes of Siberia abound in fish, but little is known of their relations with the species of neighbouring regions.[1]

The insect fauna is very similar to that of Russia, but a few genera, as the *Tentyria*, do not penetrate into the steppe region of Western Siberia, while the tropical *Colasposoma, Popilia*, and *Languria* are found only in south-eastern Transbaikalia, or are confined to the southern Amur. On the other side, several American genera (*Cephalaon, Ophryastes*) extend into the north-eastern parts of Siberia.[2] As in all uncultivated countries, the forests and prairies of Siberia become almost uninhabitable in summer on account of the mosquitoes. Eastern Siberia suffers less from this plague than the marshy Baraba, but on the Amur and the Sungari large gnats become an unsupportable plague, and travellers who have had experience of the mosquitoes of the tropics readily admit that they yield to those of Siberia. Burning the prairie is the only expedient for destroying them, and is freely resorted to, with the result that the forest is frequently set on fire.

In Molluscs Siberia is much richer than had been supposed. The dredgings of the "Vega" expedition in the Arctic Ocean disclosed an unexpected wealth of marine fauna, and those of L. Schrenck in the north of the Japanese Sea have led to the discovery of no fewer than 256 species (Gasteropods, Brachiopods, and Conchifers). Even in Lake Baikal Dr Dybowski and Dr Godlewski have discovered no fewer than ninety three species of Gammarides and twenty-five of Gasteropods.[3] The Sea of Okhotsk is very interesting in this respect, owing to its local species and the general composition of its fauna (70 species of Molluscs and 21 of Gasteropods). The land Molluscs, notwithstanding the unfavourable conditions of climate, number about seventy species,—Siberia in this respect thus being not far behind north Europe.

The Siberian fauna is very unequally distributed. The alpine tracts of Eastern Siberia and the *urmans* of Tobolsk are from the zoologist's point of view exceedingly poor, owing to the want of grass and of a mouldy soil. It is on the plateau, and especially on the lower plateau, as well as on the high plains, where the grazing grounds become numerous, that the fauna appears in its full richness. Much remains to be done in the way of investigating the distribution of animals over Siberia with reference to the physical conditions of its different parts. Although differing little from the European, the fauna of Siberia possesses great interest for the zoologist and geographer. The increase of many animals in size (becoming twice as large as in Europe), the appearance of white varieties among both mammals and birds, and their great prevalence among domesticated animals (Yakut horses), the migrations of birds and mammals over immense regions, from the Central Asian steppes to the arctic coast, performed not only in connexion with the usual rotation of seasons but also as a result of occasional climacteric conditions which are not yet fully known (e.g., the occasional migration of thousands and thousands of roebuck from Manchuria across the Amur to the left bank of the river, or the migration of reindeer so well related by Wrangel), the various coloration of many animals according to the composition of the forests they inhabit (the sable and the squirrel are well known instances), the mixture of northern and southern faunas in the Amur region and the remarkable consequences of that mixture in the struggle for existence,—all these render the study of the Siberian fauna most attractive. Finally, the laws of distribution of animals over Siberia cannot be made out until the changes undergone by its surface during the Glacial and Lacustrine periods are well established and the Post-Tertiary fauna is better known. The remarkable finds of Quaternary mammals about Omsk and their importance for the history of the *Equidæ* are but a hint of what may be expected in this field.

Population.

The great bulk of the population are Russians, whose number has increased with great rapidity during the 19th century: although not exceeding 150,000 in 1709 and 500,000 a century later, they now (1887) number more than 3,000,000, and not far from 4,000,000 if the eastern slopes of the Urals are reckoned to Siberia. At the same time the entire indigenous population does not exceed 700,000 if the Kirghizes of Semipalatinsk are reckoned to Turkestan, and many indigenes are rapidly dying out.

Russian immigration.

The Russians, issuing from the middle Urals, have travelled as a broad stream through south Siberia, sending lateral branches to the Altai, to the Ili river in Turkestan, and to Minusinsk, as well as down the chief rivers which flow to the Arctic Ocean, the banks of which are studded with villages 15 to 20 miles apart. As Lake Baikal is approached the stream of Russian immigration becomes narrower, occupying only the valley of the Angara, with a series of villages up the Irkut, but it widens again in Transbaikalia, sending lateral branches up the Selenga and its tributaries. It follows the course of the Amur, again in a succession of villages some 20 miles apart, and can be traced up the Usuri to Lake Khangka and Vladivostok, with an extension of villages on the plains between the Zeya and the Selimja. Small Russian settlements also occur on a few bays of the North Pacific and the Sea of Okhotsk, as well as on Saghalin (see SAGHALIN). The Russians have thus occupied all the best agricultural tracts in Western and Eastern Siberia.

Indigenous races.

As to the indigenous races, the Ugrian stocks which occupy the north-west of Siberia are represented by (1) the Voguls (about 6400), on the eastern slopes of the Urals, in Perm and Tobolsk, extending partly over the western slope; they closely resemble the Ostiaks, in some features approximating the Mongol race, and speak the same language; (2) the OSTIAKS (*q.v.*); and (3) the SAMOYEDES (*q.v.*).

Turkish stocks.

Survivals of Turkish stocks, once much more numerous, are spread all over south Siberia as far as Lake Baikal. Their territories are rapidly being occupied by Russians, and their settlements are cut in two by the Russian stream,—the Baraba Tatars and the Yakuts being to the north of it, and the others having been driven back to the hilly tracts. According to M. Radloff,[4] they are as follows:—(1) the Karagases in the Yeniseisk and Irkutsk spurs of the Sayan Mountains (about 500); (2) the Abakan Tatars (about 10,000),—driven from the Irtish, they occupied the Abakan steppes after the emigration of the Kalmucks; (3) those of the Tcholym scattered amidst Russians (500); (4) the Tatars of the north and north-east Altai, in all about 20,000,—(*a*) the Kumandintsy, (*b*) the Lebed Tatars, (*c*) the *tchern* or forest Tatars, (*d*) the Shorghintses; (5) those of the Altai proper,—(*a*) Altaians (11,800), (*b*) Dvoedantsy (2000), who until 1865 paid tribute to both Russia and China, and (*c*) the Teleutes (5800), mostly Russified; (6) the Soyotes and Uryankhes of East Sayan, of whom a few families are in Siberian territory; (7) the Baraba Tatars (4650), mostly driven northwards to the forest and marsh region; (8) the Irtish and Tobolsk Tatars (some 7000 to 10,000 on the Tara and 15,700 in the Tobolsk district). In all they number about 73,000, to whom should be added a number of Kirghiz from Turkestan. The great Turkish stock of the Yakuts (see YAKUTSK) in the basin of the Lena numbers about 200,000. Most of these Turkish stocks live by cattle-breeding and some by agriculture, and are a most laborious and honest population.

Mongols.

The Mongols (about 350,000) extend into Western Siberia from the high plateau,—nearly 20,000 Kalmucks living in the eastern Altai. In Eastern Siberia the Buriats occupy the Selenga and Uda, parts of Nertchinsk, and the steppes between Irkutsk and the upper

[1] Czekanowski (*Izvestia Sib. Geog. Soc.*, 1877) has described fifty species from the basin of the Amur; he considers that these constitute only two thirds of the species inhabiting that basin.

[2] L. Schrenck, *Reisen und Forschungen im Amurlande*, 1858-80.

[3] *Mém. de l'Acad. des Sc. de St Petersb.*, vol. xxii., 1876.

[4] *Aus Sibirien*, 2 vols., Leipsic, 1884; also in *Jivopisnaya Rossiya*, vol. xii.

Lena, as also the Baikal Mountains and the island of Orkhon, they support themselves chiefly by stock-breeding, but some of them, especially in Irkutsk, are agriculturists (see TRANSBAIKALIA) On the left of the Amur there are about 10,000 Chinese and Manchurians about the mouth of the Zeya, and nearly 3000 Coreans on the Pacific coast The Tunguses, although few in numbers (50,000), occupy as their hunting-grounds an immense region on the high plateau and its slopes to the Amur, but their limits are yearly becoming more and more circumscribed both by Russian gold-diggers and by Yakut settlers

Finally, in the north-east we find a group of stocks whose ethnological place is not yet accurately determined They are united into a separate North Asian linguistic group, and include the Tchuktchis, who may number 12,000, the Koryaks (5000), and the Kamchadales (3000), the Ghilyaks (nearly 5000) of the lower Amur and north Saghalin, and the Ainos (3000) of south Saghalin The Yukaghirs (1600) seem to be merely Tunguses Some 5000 Gipsies wander about Siberia

Condition of indigenes. Much has been written of late about the sad state of the indigenous populations of Siberia [1] They are pitilessly deprived of their hunting and grazing grounds and compelled to resort to agriculture, —a modification exceedingly hard for them, not only on account of their poverty but also because they are compelled to settle in the less favourable regions European civilization has made them familiar with all its worst sides and with none of its best Taxed with a tribute in furs (*yasak*) from the earliest years of the conquest, they often revolted in the 17th century, but were cruelly reduced to obedience The tribute was never great (about 1¼ roubles per head), but the official valuation of furs was always only one third to one fourth of their real value and the exactions of the authorities trebled it again In 1824 the settled indigenes had to pay the very heavy rate of 11 roubles per head, and the arrears, which soon became equal to the sums levied, were rigorously exacted It must be fully acknowledged that severe measures taken by the Government in the last two centuries prevented the growth of anything like legalized slavery on Siberian soil, but the people, ruined as they were both by the intrusion of agricultural colonists and by the exactions of Government officials, fell into what was practically a kind of slavery (*kabala*) to the merchants Even the best-intentioned Government measures, such as the importation of corn, the prohibition of the sale of spirits, and so on, became new sources of oppression The action of missionaries, who cared only about nominal Christianizing, had no better effect It is worthy of notice that the spread of Mohammedanism among the Tatars and Kirghizes and of Lamaism among the Buriats took place under the Russians and was favoured by the Government

Siberian Russians. The Russians of Siberia differ to some extent from those of the mother-country They might have been expected to intermix largely with the Finnish, Turkish, and Mongol elements with which they came in contact, but, in consequence of causes already mentioned under RUSSIA (vol xxi p 78), the mixture is much less than might be supposed, and the continuous arrival of new immigrants contributed to lessen the effects of mixtures which really took place One is accordingly struck to find in Western Siberia compact masses of Russians who have lost so little of their primitive ethnographical features, and to hear throughout Siberia a language which differs from that of northern Russia only by a slight admixture of words borrowed from the natives (mostly relating to hunting or cattle rearing), and a few expressions of Polish origin The case is otherwise, however, on the outskirts Castrén characterized Obdorsk (mouth of the Ob) as a true Samoyedic town, although peopled with "Russians" The Cossacks of Western Siberia have the features and customs and many of the manners of life of the Kalmucks and Kirghiz Yakutsk is thoroughly Yakutic, marriages of Russians with Yakut wives are common, and some forty years ago the Yakut language was predominant among the Russian merchants and officials At Irkutsk and in the valley of the Irkut the admixture of Tungus and Buriat blood is obvious, and still more in the Nertchinsk district and among the Transbaikalian Cossacks settled for the last two centuries on the Argun They speak the Buriat language as often as Russian, and in a Buriat dress the Argun Cossack can hardly be distinguished from a Buriat In separate parts of Siberia, on the borders of the hilly tracts, the mixture with Tatars was quite common Of course it is now rapidly growing less, and the settlers who entered Siberia in the 19th century married Russian wives and remained thoroughly Russian There are accordingly parts of Siberia, especially among the Raskolniks, where the north Russian, the Great Russian, and the Ukrainian types have maintained themselves in their full purity, and only some differences in domestic architecture, in the disposition of their villages, and in the language and character of the population remind the traveller that he is in Siberia The Russians in Siberia have emigrated from all parts of European Russia, but the special features of the language and partly also of the national character are due to the earliest settlers, who came mostly from northern Russia

The natural rate of increase of population is very slow as a rule, and does not exceed 7 or 8 per 1000 annually The great mortality, especially among children, is one of the causes of this, the birth-rate being also lower than in Russia In Western Siberia the former is 38 per 1000 in towns and 30 in villages, while the births are 43 in towns and 44 in villages The climate of Siberia, however, cannot be called unhealthy, except in certain localities where goitre is common (on the Lena, in several valleys of Nertchinsk, and in the Altai Mountains) The rapid growth of the actual population is chiefly due to immigration

Agriculture. Agriculture is the chief occupation both of the settled Russian and of the native population South Siberia has a very fertile soil and yields rich crops, but immense tracts are utterly unfit for tillage In the lowlands of Western Siberia it is carried on up to 61° N lat [2] On the high plains fringing the alpine tracts on the north-west it can be carried on only in the south, farther north only in the valleys, reaching 62° N lat in that of the Lena, and in the alpine tracts in only a few valleys, as that of the Irkut On the high plateau all attempts to grow cereals have failed,—only the wide trenches (Uda, Selenga, Djida), already described, giving encouragement to the agriculturist On the lower plateau, in Transbaikalia, grain is successfully raised in the Nertchinsk region,—with serious risks, however, from early frosts in the valleys of the mountain-ridges which rise above its surface South-east Transbaikalia suffers from want of water, and the Buriats irrigate their fields Although agriculture is carried on on the upper Amur, where land has been cleared from virgin forests, it really prospers only below Kumara and on the rich plains of the Zeya and Selimja In the depression between the Bureya range and the coast ranges it suffers greatly from the heavy July and August rains, and from inundations, while on the lower Amur the agriculturists barely maintain themselves by growing cereals in clearances on the slopes of hills, so that the settlements on the lower Amur and Usuri continually require help from Government to save them from famine The chief grain-producing regions of Siberia are—the Tobol and Ishim region, the Baraba, the region about Tomsk, and the outskirts of the Altai, which cover an aggregate of 330,000 square miles (155,000 in the Altai), they have a thoroughly Russian population of nearly 2,000,000 inhabitants, and nearly 8,600,000 acres are under crops The Tobolsk region, mostly covered with *urmans*, but having nearly 1,000,000 acres cultivated, and the northern districts of Semipalatinsk, which are being rapidly colonized, must be added to the above On the whole, in the basins of the Ob and Irtish, the annual yield is about 2,350,000 quarters of summer wheat, 1,260,000 of summer rye, 3,240,000 of oats, and 6,000,000 bushels of potatoes The figures for Eastern Siberia are not so reliable,—about 1,100,000 quarters of various grains in Irkutsk (one-third raised by the Buriats), 400,000 in Transbaikalia, 40,000 in Yakutsk, about 100,000 in the Amur province, and 25,000 in the Maritime Province, and the Yeniseisk peasants sell every year about 700,000 cwts of corn The Minusinsk district, one of the richest in Siberia (45,000 inhabitants, of whom 2800 are settled and 24,000 nomadic), has more than 45,000 acres under crops, and in the whole province of Yeniseisk about 3,000,000 acres are cultivated

Cattle-breeding. Cattle-breeding is extensively carried on in many parts In the Ob and Irtish region of Western Siberia there are about 2,000,000 horses, 1,500,000 head of horned cattle, 3,000,000 sheep, and 100,000 reindeer, for Eastern Siberia the figures are approximately 850,000 horses, 1,100,000 horned cattle, 1,120,000 sheep, and about 50,000 reindeer The industry is, however, carried on in the most primitive manner In Transbaikalia little hay is made, and the Buriat horses seek their food throughout the winter beneath the thin sheet of snow which covers the steppes A single snowstorm in spring sometimes destroys in a few days thousands of horses thus weakened In Western Siberia the "Siberian plague" makes great ravages, and the average losses are estimated at about 37,500 head of cattle annually

Bee keeping. Bee keeping is widely diffused, especially in Tomsk and the Altai Honey is exported to Russia The seeds of the stone-pine are collected for oil in Western Siberia

Hunting. Hunting still continues to be a profitable occupation, the male population of whole villages in the hilly and woody tracts setting out in October for a month's hunting The sable, however, which formerly constituted the wealth of Siberia, is now so scarce that four sables per man is the maximum in the best districts Squirrels, bears, foxes, snow-foxes, antelopes, and especially deer in spring are at present the principal objects of the chase But even in Yakutsk the total produce of hunting was in 1879 only 65 sables, 2360 snow-foxes, 23,440 ermines, 140,550 squirrels, 1780 foxes, 145 bears, 1310 reindeer, and 26,780 hares The forests on the Amur yielded a rich return of furs during the first years of the Russian occupation, and the Amur sable, although much inferior to the Yakutsk and Transbaikalian, was largely exported In 1862 1800 sables and 40,000 squirrels were killed in the province of Amur,

1 Yadrintseff's *Siberia as a Colony* contains a summary of this literature with bibliography

2 The northern limits of agriculture are 60° N lat on the Urals, 62° at Yakutsk, 61° at Aldansk, 54° 30′ at Udskoi, and 53° to 54° in the interior of Kamchatka (Middendorff, *Sibirische Reise*, vol iv)

and 9300 in the Maritime Province, but in 1877 the total export from the former did not exceed in value £1700 to £2000.

Fishing. The same falling off is observable in the fisheries,—one species at least, the *Rhytina stelleri*, having completely disappeared within the 19th century. Fishing is still a valuable source of income on the lower courses of the great rivers, especially the Ob, where the yearly earnings amount to about £30,000. The fisheries on Lake Baikal supply cheap food (the *omul*) to the poorer classes of Irkutsk and Transbaikalia. The native populations of the Amur—Golds and Ghilyaks—support themselves chiefly by their fisheries, when the salmon enters in dense masses the Amur and its tributaries.

Manufactures. Though Siberia has within itself all the raw produce necessary for prosperous industries, it continues to import from Russia without exception all the manufactured articles it uses. Owing to the distances over which they are carried and the bad organization of trade, all manufactured articles are exceedingly dear, especially in the east. The manufactories of Siberia employ less than 15,000 workmen, and their aggregate production does not exceed £1,600,000 in value; of these 11,500 are employed in Western Siberia, the yearly production being about £1,200,000. Nearly one-third of the total represents wine-spirit, 23 per cent. tanneries, 13 per cent. tallow-melting, and a considerable sum cigarette-making. The villages of Siberia do not carry on a variety of petty trades like the villages in Russia, except in the districts of Tobolsk nearest the Urals, where tanning, boot-making, carpet-making, and the like are prosecuted.

Mining. Mining is in the same backward state as manufacturing industry. The chief attention is given to gold-mining. But the use of improved machinery is far from common, and the condition of the workmen wretchedly bad,—insufficient food, bad lodgings, and overwork under the most unsanitary conditions. As the geology of the gold mining districts is quite unknown, immense sums are sunk in futile search. The amount of gold obtained has much increased since mining was begun in the Nertchinsk district and parts of the Altai (a right formerly reserved for the imperial Government), and since the discovery of auriferous deposits in the basin of the Amur and in the Maritime Province. It reached in 1882 4563 ℔ in Western Siberia (nearly all in the Altais), and 58,420 ℔ in Eastern Siberia (about 27,000 in Yakutsk, more than 10,000 in Nertchinsk, and about 8000 in the province of Amur). The Altai mines (12,000 workmen) yielded in 1881 16,670 ℔ of silver (13,310 in 1882), 13,140 cwts of lead, 6700 of copper (the last two decreasing items), 3200 of iron, 240,000 of coal, and about 320,000 of salt. Silver-mining is almost entirely abandoned in Nertchinsk, and in 1882 only 1900 ℔ were extracted.

Trade. Trade is in the hands of a few merchants. The chief market is the Nijni-Novgorod fair, where Siberian merchants get twelve or eighteen months' credit at correspondingly high rates.[1] Prices on the Amur are not more favourable, since the trade by sea is prevented from developing owing to the facility with which great profits are made by the exchange of wine spirit and sables for whisky. The villages are in a still worse condition, whole populations being dependent for the necessaries of life upon a few merchants. The foreign trade is insignificant, and the hundred merchant ships (thirty English) which visited the port of Vladivostok in 1883 came chiefly for the needs of the garrison. The imports of manufactured wares from Russia amount to an annual value of £12,000,000; the corresponding exports of raw produce are only about £4,000,000,—tallow, hides, furs, and grain being the chief items. There are several great fairs in Siberia, that of Irbit (with an annual turnover of £5,000,000 to £7,000,000) being the most important. Those of Ishim, Tomsk, Irkutsk, and Verkhne-Udinsk deserve mention. In the north and north-east several fairs, where natives gather to pay tribute, to sell furs, and to purchase food and necessaries for hunting, have a local importance.

Communication. The main line of communication is the great Moscow road. It starts from Perm on the Kama, and, crossing the Urals, reaches Ekaterinburg—the centre of mining industry—and Tyumen on the Tara, whence steamers ply *via* Tobolsk to Tomsk. A railway has of late been constructed between Perm and Ekaterinburg, touching the chief ironworks of the eastern slope of the middle Urals, and has been continued *via* Kamyshloff to Tyumen. From Tyumen the Moscow road proceeds to Omsk, Tomsk, Krasnoyarsk, and Irkutsk, sending off from Kolyvan a branch south to Barnaul in the Altai and to Turkestan. From Irkutsk it proceeds to Transbaikalia, and Lake Baikal is crossed either by steamer or (when frozen) on sledges, in either case from Listvenitchnaya to Posolskoye. A route was laid out about 1868 round the south shore of Lake Baikal in order to maintain communications with Transbaikalia during the spring and autumn, which were frequently interrupted when the old route from Selenghinsk across the Khamar daban had to be resorted to. From Posolskoye on Lake Baikal the great road proceeds to Verkhne-udinsk, Tchita, and Sryetensk on the Shilka, whence steamers ply to the mouth of the Amur and up the Usuri and Sungatcha to Lake Khangka. When the rivers are frozen communication is maintained by sledges on the Amur; but in spring and autumn the only continuous route down the Shilka and the Amur, to its mouth, is on horseback along a mountain path (very difficult across the Bureya range). On the lower Amur and on the Usuri the journey is also difficult even on horseback. On the whole the steamer communication is in an unsatisfactory state, and when the water on the upper Amur is low vessels are sometimes unable to reach the Shilka. The Yenisei is navigated as far as Minusinsk, and communication is maintained along its banks in the summer by boat and horse. The Angara offers great difficulties to navigation on account of its rapids; regular water communication begins only below these and is continued to its mouth. On the Lena, which is an important waterway from Kirensk, merchandise is shipped for the gold mining companies on the Lena below the Vitim, and sometimes up the lower Vitim. Another route of importance before the conquest of the Amur is that which connects Yakutsk with Okhotsk or Ayan. Regular postal communication is maintained by the Russians between Kiachta and Kalgan (close by Peking) across the desert of Gobi. Owing to the relatively good condition of the great highway the journey to Siberia is not so difficult or formidable as is generally supposed. As a rule the Siberians travel freely, and long journeys are undertaken more readily than short railway journeys are in Europe.

Colonization. Siberia has been colonized in two different ways. On the one hand, the Government sent parties (1) of Cossacks to settle on the frontiers, (2) of peasants who were bound to settle at appointed places and maintain the communications along the routes, (3) of *streltsys* to garrison forts, (4) of *yamschiks*—a special organization of Old Russia intrusted with the maintenance of horses for postal communication, and finally (5) of convicts. Even so recently as 1856-57 a good deal of the Amur region was peopled in this way. Serfs in the imperial mines were liberated and organized in Cossack regiments (the Transbaikalia Cossacks), some of them were settled on the Amur, forming the Amur and Usuri Cossacks. Other parts of the river were colonized by peasants who emigrated with Government aid, and were bound to settle in villages, about 20 miles apart, on the Amur, at spots designated by officials. As a rule, this kind of colonization has not produced the results that were expected. On the other hand, free colonization has been more successful and has been undertaken on a much larger scale. Soon after the first appearance of the Cossacks of Yermak in Siberia thousands of hunters (*promyshlenyie*), attracted by the furs, immigrated from north Russia, explored the country, traced the first footpaths, and erected the first houses in the wilderness. Later on serfdom, religious persecutions, and conscription were the chief causes which led the peasants to make their escape to Siberia and build their villages in the most inaccessible forests, in the prairies, and even on Chinese territory. The severe measures of the Government against such "runaways" could not prevent their immigration to Siberia. While governmental colonization studded Siberia with forts, free colonization filled up the intermediate spaces. This free colonization has continued throughout the 19th century, occasionally assuming larger proportions, as in 1848-55. Since the emancipation of the serfs it has been steadily increasing. In spite of the involved formalities which the peasants have to go through before emigrating, and the great expense, whole villages emigrate from Russia to Siberia. During the twenty-five years ending 1879 no fewer than 100,000 persons crossed the Urals, and in 1882 the Ural Railway conveyed 7025 emigrants, while the total number of emigrants to Siberia in the same year was estimated at not less than 40,000.[2]

Exiles. Siberia is a great penal colony. Exile to Siberia began in the first years of its discovery, and as early as 1658 we find the Nonconformist priest Avvakum[3] following in chains the exploring party of Pashkoff on the Amur. Raskolniks in the second half of the 17th century, rebel *streltsy* under Peter I., courtiers of rank during the reigns of the empresses, Polish confederates under Catherine II., the "Decembrists" under Nicholas I., nearly 50,000 Poles after the insurrection of 1863, and later on whole generations of socialists were sent to Siberia; while the number of common law convicts and exiles transported thither has steadily increased since the end of the 18th century. No exact statistics of Siberian exile were kept before 1823. But it is known that in the first years of the 19th century nearly 2000 persons were transported every year to Siberia. This figure had reached an average of 18,250 in 1873-77 and rose above 20,000 in 1882. Between 1823 and 1877 the total was 393,914,[4] to which ought to be added the families of many exiles, making more than 600,000 men, women, and children transported since the beginning of the 19th century. Of 151,584 transported during the ten years 1867-76 18,582 were

[1] Salt in the Altai region (where it is obtained) is retailed at 2 roubles 40 copecks the *pud* (4s. 10d. for 32 ℔), sugar, which is sold at 7 to 8 roubles the *pud* in Western Siberia (14s. to 16s. the 32 ℔), reaches 12 to 20 roubles in Transbaikalia, and occasionally 40 roubles at Yakutsk.

[2] Yadrintseff, *Siberia as a Colony*; Levitoff, *Guide to West Siberia* (Russian); *Russkaya Mysl*, July 1882.

[3] The autobiography of the protopope Avvakum is one of the most popular books with Russian Nonconformists.

[4] The Poles are not reckoned in the above figures.

condemned to hard labour, 28,382 to be settled with loss of civil rights (*ssylno-poselentsy*), 23,383 to be settled without loss of rights (*na vodvorenie*), 2551 to live nearly free (*na jitie*), while 78,686 were transported simply by orders of the administration or decisions of the village communities. In 1884 21,104 exiles, followed by 1752 women and 3631 children, were transported to Siberia. Their distribution under different heads was nearly the same as the above. The hard labour convicts (some 1800 or 1900) sent every year are distributed among several prisons in Western and Eastern Siberia, the imperial gold-washings at Kara on the Shilka, and the salt works of Usolie and Ust Kut; but, as these prisons and works cannot take more than 10,000 in all, the surplus have to be sent to SAGHALIN (*q.v.*), where they are employed in the coal-mines, or settled. After liberation the hard-labour convicts enter the category of *ssylno poselentsy*, and are settled in villages. It appears from recent inquiries that nearly all are in a wretched condition, and that of the 200,000 on the official registers more than one-third have disappeared without being accounted for. Nearly 20,000 men (40,000 according to other estimates) are living in Siberia the life of *brodyaghi*, trying to make their way through the forests to their native provinces in Russia. The exile population of Siberia is much smaller than is generally supposed, being—in Tobolsk, 59,000, 4.6 per cent of population, in Tomsk, 29,800, 2.6, in Yeniseisk, 45,000, 10.6, in Irkutsk, 40,000, 10, in Transbaikalia, 21,335, 4.3, in Yakutsk, 3000, 1.2; total, 198,153 or 4.9 per cent.

Education. Education stands at a very low level. The chief town of every province is provided with a classical gymnasium, where the sons of the local officials prepare for the university, and a gymnasium or progymnasium for girls; but the education there received is not of a high grade, and the desire of the local population for "real schools" is not satisfied. The sum of £10,000 bequeathed by Demidoff in 1817 for the foundation of a university in Siberia, together with an additional £40,000 raised by subscription, remains unemployed, and, although the Government finally permitted the erection of buildings for a university at Tomsk, it again decided (1885), for political reasons, to postpone its opening. In 1883 there were in Western Siberia only 534 schools of all descriptions, with 14,097 male and 4915 female pupils. Transbaikalia had in 1881 108 schools of a very inferior kind, with 3828 pupils; Yakutsk, 23 schools, with 633 pupils in 1882. There are in all five gymnasia and five progymnasia for boys, three gymnasia and two progymnasia for girls, two "real schools," and three normal schools; but many vacant teaching posts in gymnasia remain unoccupied. Primary education is in a very unsatisfactory state, and primary schools very scarce.

Administrative divisions. Siberia is divided into four governments,—Tobolsk, Tomsk, Yeniseisk, and Irkutsk,—and four provinces,—Yakutsk, Transbaikalia, Amur, and Maritime or Primorskaya. The first two are under governors, like Russian governments; the next four are under the governor-general of Eastern Siberia, who resides at Irkutsk; the Amur and Maritime provinces are under the governor-general of the Amur, who resides at Khabarovka, at the junction of the Amur and the Usuri. The respective chief towns are—Tobolsk, Tomsk, Krasnoyarsk, Irkutsk, Yakutsk, Tchita, Blagovechensk, and Khabarovka. The provinces of Akmolinsk (chief town, Akmoly) and Semiryetchensk (chief town, Vyernyi) are now parts of the steppe governor generalship. Each government and province is subdivided into districts; the administrative head is a civil governor in the governments and a military governor in the provinces. By the regulations of 1834 each governor and governor-general is assisted by a council composed of chiefs of several departments (nominated by the governor general), and several officials depending directly upon the respective ministries. The council has only a consultative voice, the final decision resting with the administrative head. The governors general and military governors command the military forces of the provinces,—Cossacks and regulars. The new system of legal procedure introduced in Russia in 1866 has not yet been extended to Eastern Siberia, where the old courts are still in force. It has been introduced in Western Siberia, but without juries. The towns have received the new municipal organization. The *zemstvo* is not yet organized. The districts are under the control of *ispravniks* and *zasedatels*, who have very extensive powers, and are not controlled by self-government of the peasantry. The Cossacks—the Siberian on the Kirghiz frontier (90,000 persons, stretching in villages along a line of 1200 miles), the Transbaikalian, and those of the Amur and the Usuri, whose villages are dotted along the Amur to its junction with the Usuri and along the Usuri to Lake Khangka and Vladivostok—are under their own officers, and special administrative functions are entrusted to the military chief (*ataman*) of each separate Cossack *voisko*. The Altai and Nertchinsk mines, with their territories and populations, are under the imperial cabinet,—all private mines being under the inspection of mining engineers.

Since the earliest years of conquest Siberia has been placed under the rule of *voivodes* (governors), under a special department at Moscow. In 1708 it was divided into five provinces, depending upon a governor residing at Tobolsk. Catherine II. introduced in 1764 a vice royalty, which existed, however, only until 1799, when governors and governors-general were introduced. This system prevailed until 1819. This part of the history of Siberia was an unbroken record of robbery, tyranny, and folly on the part of the governors and *ispravniks*, such as would seem incredible were the facts not testified to by the annals and documents recently published in Russia. In vain were the severest measures resorted to. Peter I. ordered the governor Prince Gagarin to be hanged, and the governor Joloboff was executed in 1736, while many minor officials were condemned to hard labour or the knout. The robberies and the cruelties of rulers like Kryloff, Pestel, Treskin, Loskutoff, and their myrmidons compelled the Government to undertake a thorough inquiry, and for this purpose Speransky was sent in 1819. To him Siberia is indebted for the new system of administration which has since remained in force.

Towns. The chief towns of Siberia are—Ekaterinburg (25,150 inhabitants), which belongs, however, to Perm, although situated on the eastern slope of the Urals; Tomsk (31,550), a commercial city, selected as the site of the university; and Irkutsk (36,120 in January 1884), capital of Eastern Siberia, a trading city. Tobolsk (20,130), Krasnoyarsk (16,800), Tchita (12,600), Blagovyeschensk (8000), and Khabarovka (2500) are mere administrative centres. Biysk in Tomsk (18,700) yearly acquires more importance from its trade with the Kirghiz steppe. Kurgan (8915) and Yalutorovsk (4500) in Tobolsk are large villages, dependent chiefly on agriculture and some trade. Barnaul (17,350), Kolyvañ (12,450), Kuznetsk (7355), Zmeinogorsk (6160), and Zyrianovsk (4450) in the Altai are mining centres, Barnaul is the seat of the mining administration. Tyumeñ (14,300) and Tara (8650) in Tobolsk, Mariinsk in Tomsk, Kainsk (8050) and Minusinsk (7400) in Yeniseisk, Kiachta (4300), Verkhneudinsk (4150), and Nertchinsk (4070) in Transbaikalia, may be mentioned as local commercial centres—Kiachta having once had great importance in the tea trade with China. The others are merely administrative centres. Towns like Obdorsk, Berezoff, Narym, Viluisk, Verkhoyansk, Okhotsk, and many others which figure on the maps are merely administrative centres for levying the *yasak*, each with less than 1000 or even fewer than 500 and 300 inhabitants. Of the fifty-three towns of Western and Eastern Siberia only two have more than 30,000 and eight from 12,000 to 21,000 inhabitants each; in ten towns the population ranges from 5000 to 10,000.

History. The shores of all the lakes which filled the depressions during the Lacustrine period are covered with remains dating from the Neolithic Stone period; and numberless *kurgans* (tumuli), ovens, and so on bear witness to a much denser population than the present. During the great migrations in Asia from east to west many populations were probably driven to the northern borders of the great plateau and thence compelled to descend into Siberia; succeeding waves of immigration drove them still farther towards the barren grounds of the north, where they melted away. According to Radloff, the earliest inhabitants of Siberia were the Yeniseians, who spoke a language different from the Ural Altaic; some few traces of them (Yeniseians, Sayan-Ostiaks, and Kottes) have been found among the Sayan Mountains. The Yeniseians were followed by the Ugro Samoyedes, who also came originally from the high plateau and were compelled, probably during the great migration of the Huns in the 3d century B.C., to cross the Altai and Sayan ranges and to enter Siberia. To them must be assigned the very numerous remains dating from the Bronze period which are scattered all over south Siberia. Iron was unknown to them, but they excelled in bronze, silver, and gold work. Their bronze ornaments and implements, often polished, evince a great development of artistic taste; and their irrigated fields covered wide areas in the fertile tracts. On the whole, their civilization stood much higher than that of their more recent successors. Eight centuries later the Turkish stocks of "Tukiu" (in Chinese spelling), Khagasses, and Uiguris—also compelled to migrate north westwards from their former seats—subdued the Ugro Samoyedes. These new invaders have likewise left numerous traces of their sojourn, and two different periods may be easily distinguished in their remains. They were acquainted with iron, and learned from their subjects the art of bronze casting, which they used for decorative purposes only, and to which they gave a still higher artistic stamp. Their pottery is also much more perfect and more artistic than that of the Bronze period, and their ornaments now have a place among the finest collections at the St Petersburg Hermitage. This Turkish empire of the Khagasses must have lasted until the 13th century, when the Mongols, under Jenghiz Khan, subdued them and destroyed their civilization. A decided decline is shown by the graves which have been discovered, until the country reached the low level at which it was found by the Russians on their arrival towards the close of the 16th century. In the beginning of the 16th century Tatar fugitives from Turkestan subdued the loosely associated tribes inhabiting the lowlands to the east of the Urals. Agriculturists, tanners, merchants, and mollahs (priests) were called from Turkestan, and small principalities sprang up on the Irtish and the Ob. These were united by Khan Ediger, and conflicts with the Russians

who were then colonizing the Urals brought him into collision with Moscow, his envoys came to Moscow in 1555 and consented to a yearly tribute of a thousand sables. This source of wealth attracted Russian adventurers to the trans-Ural regions. As early as the 11th century the Novgorodians had occasionally penetrated into Siberia, but the fall of the republic and the loss of its north-eastern dependencies checked the advance of the Russians across the Urals. On the defeat of Stepan Razin many who were unwilling to submit to the iron rule of Moscow made their way to the settlements of Stroganoff in Perm, and tradition has it that, in order to get rid of his guests, Stroganoff suggested to their chief, Yermak, that he should cross the Urals into Siberia, promising to help him in this enterprise with supplies of food and arms. Yermak entered Siberia in 1580 with a band of 1636 men, following the Taghil and Tura rivers. Next year they were on the Tobol, and 500 men successfully laid siege to Isker, the residence of Khan Kutchum, in the neighbourhood of what is now Tobolsk. Kutchum fled to the steppes, abandoning his domains to Yermak, who, according to tradition, purchased by the present of Siberia to Ivan IV his own restoration to favour. Yermak was drowned in the Irtish in 1584, after having been defeated by the Tatars. After his death the Cossacks abandoned Siberia, but new bands of hunters and adventurers, attracted by the furs, poured every year into the country, and were supported by regular troops from Moscow. To avoid conflicts with denser populations in the south, they preferred to advance eastwards along higher latitudes, meanwhile Moscow sent fresh detachments of troops under *voivodes*, who erected forts and settled labourers around them to supply the garrisons with food, gunpowder, and arms. Within eighty years the Russians had reached the Amur and the Pacific. This rapid conquest is accounted for by the circumstance that they met with no organized resistance: they found only the Tatar Kutchum on the Tobol, and in the Altai the Turkish stocks under the Kalmuck Altyn Khan, the centre of whose power was on the Kemtchik, and who collected tribute from the Teleuts, Uryankhs, Telesses, Beltirs, Buruts (Kirghiz), and other smaller tribes. Neither Tatars nor Turks could offer any serious resistance. When travelling down the Yenisei in 1607-10 the Cossacks first encountered Tunguses, who strenuously fought for their independence, but were at last subdued about 1623. In 1628 the Russians reached the Lena, founded the fort of Yakutskiy in 1637, and two years later reached the Sea of Okhotsk at the mouth of the Ulia river. The Buriats offered some opposition, but between 1631 and 1641 the Cossacks erected several palisaded forts in their territory, and in 1648 the fort on the upper Uda (Verkhne-Udinskiy Ostrog) beyond Lake Baikal. In 1643 Poyarkoff's boats descended the Amur, returning to Yakutsk by the Sea of Okhotsk and the Aldan, and in 1649-50 Khabaroff occupied the course of the Amur. The resistance of the Chinese, however, obliged the Cossacks to quit their forts, and by the treaty of Nertchinsk (1689) Russia abandoned her advance into the basin of the river. In her anxiety to keep peace with China and not to endanger the Kiachta trade, Russia rigorously prohibited and punished all attempts of the Siberians to advance farther towards that river until 1855. In 1849 the Russian ship "Baikal" discovered the estuary of the Amur, in 1851 the military post of Nikolaievskiy was established at its mouth, and two years later the post of Mariinsk near Lake Kizi. Next year a Russian military expedition under Muravioff explored the Amur, and in 1857 a chain of Russian Cossacks and peasants had already settled along the whole course of the river. The accomplished fact was recognized by China in 1857 and 1860 by a treaty. In the same year in which Khabaroff explored the Amur (1648) the Cossack Dejneff, starting from the Kolyma, sailed round the north-eastern extremity of Asia through the strait which was rediscovered and described eighty years later by Behring (1728). Cook in 1778, and after him La Pérouse, settled definitively the broad features of the northern Pacific coast. Although the Arctic Ocean had been reached as early as the first half of the 17th century, the exploration of its coasts by a series of expeditions under Ovtsyn, Minin, Prontchischeff, Lasinius, and Lapteff—whose labours constitute a brilliant page in the annals of geographical discovery—was begun only in the 18th century (1735-39).

The scientific exploration of Siberia begun in the period 1733 to 1742 by Messerschmidt, Gmelin, and De Lisle de la Croyère was soon followed up by Muller, Fischer, and Georgi. Pallas, with several Russian students, laid the first foundation of a thorough exploration of the topography, fauna, flora, and inhabitants of the country. The journeys of Hansteen and Erman (1828-33) were a most important new step in the exploration of the territory. Humboldt, Ehrenberg, and Gustav Rose also paid in the course of these years short visits to Siberia, and gave a new impulse to the accumulation of scientific knowledge, while Ritter elaborated in his *Asien* the true foundations of a sound knowledge of the structure of Siberia. Middendorff's journey (1841-43) to north-eastern Siberia—contemporaneous with Castrén's journeys for the special study of the Ural-Altaian languages—directed attention to the far north and awakened interest in the Amur, whose basin soon became the scene of the expeditions of Akhte and Schwarz (1852), and later on (1854-57) of the great Siberian expedition to which we owe so marked an advance in our knowledge of Eastern Siberia. The Siberian branch of the Russian Geographical Society was founded at the same time at Irkutsk, and afterwards became a permanent centre for the exploration of Siberia, while the opening of the Amur and Saghalin attracted Maack, Schmidt, Glehn, Radde, and Schrenck, whose works on the flora, fauna, and inhabitants of Siberia have become widely known.

Ges. zu St Petersburg*; *Meteorologischer Jahrbuch* and *Annales* of the Central Physical Observatory; *Drevnyaya i Novaya Rossiya*; the medical and topographical *Sbornik*, the *Sbornik Sudebnoi Mediciny*, and "The Health" (*Zdorovie*) contain most valuable contributions to the demography of Siberia; the newspapers *Amur*, *Vostochnoie Oboszrenie*, and especially *Sibir*, now published at Irkutsk; *Russische Revue*; *Priroda*, a popular review containing valuable information about hunting; *Pamyatnyia Knijki* (almanacs) of separate governments. The official publication of the ministry of navy, *Morskoi Sbornik*, contains many important contributions to the geography of Siberia, as also, occasionally, the *Voennyi Sbornik*. Complete indexes by M. Mezhoff are published by the Geographical Society.

(2) *Flora and Fauna.*—Besides the works of Gmelin, Georgi, Pallas, Ledebour, Middendorff, Maack, Schrenck, Radde, Schmidt, Glehn, and Maximowicz, see a large number of monographs by Schmidt, Regel, Trautvetter, Herder, Brandt, Polyakoff, Martynoff, Budischeff, and many others scattered through the publications of the Academy of Sciences, the St Petersburg Botanical Garden, the Society of Naturalists of Moscow, the Society of Friends of Natural Sciences of Moscow, and the Geographical Societies of St Petersburg and Irkutsk. Several of them are complete *florulæ* of separate regions, or important monographs of separate classes of the vegetable or animal kingdom, or lists of plants and animals collected during separate journeys; see also Taczanowski's lists of birds in *Bull. de la Soc. Zool. de France*, 1882. Mezhoff's *Bibliographical Indexes*, yearly published by the Geographical Society, and the *Indexes* of the Kieff Society of Naturalists give full details.

(3) *Geology.*—Geological observations occur in nearly all the above mentioned works of travel and serial publications. Of recent monographs the following, published in periodical publications, may be mentioned:—Meglitzky, in *Verh. der Miner. Ges. zu St Petersburg*, 1856; Schmidt, "Mammuth Reise," in *Mem. of St Petersburg Ac.*; Lopatin, on the Vitim, Yenisei, and Krasnoyarsk, in *Mining Journal* and serials of the St Petersburg and East Siberian Geographical Society; Czekanowski, in *Mem. Ac. of Sciences*; Czerski (map of shores of Baikal), in *Izvestia*, East Siberian Geographical Society, and several papers, especially on mining districts, in the *Gornyi Journal*.

(4) *Ethnology.*—Slovtsoff, *History of Siberia*; Shashkoff, a series of papers on the "Indigenous Races of Siberia," "The Native Question," "Serfdom in Siberia," "Historical Sketches," in various reviews; Polyakoff, *Journey to the Ob* (translated into German); Schapoff, in various historical works and in

the *Izvestia* of the Siberian Geographical Society, Samokvasoff, *Customary Law of Siberian Indigenes*, 1876, papers in *Otechestvennyia Zapiski*, vols ccxxxix and ccxcii, Yadrintseff, *Siberia*, 1882 Argentoff and Kostroff in the serials of the Geogr Soc give information about the present state of the indigenes and their relations to Russia

(j) *Exile* —Maximoff, *Siberia and Hard Labour*, 1871 Foinitzky, *Administration of Exile*, 1879, Vagin, "Historical Documents on Siberia," in the collection *Sibir*, vol i, Nikitin, "Prisons and the Prisons Question," in *Russkiy Vyestnik*, 1878, Mishlo, "On Siberian Prisons," in *Otetch Zapiski*, 1881, Yadrintseff, *Siberia as a Colony*, 1882, Dostoievsky, *Buried Alive*, 1881, Rosen, *Memoiren eines Decabristen*, 1870 (P A K)

SIBSÁGAR, or SEEBSAUGOR, a British district of India, in the upper valley of the province of Assam, lying between 26° 19′ and 27° 16′ N lat and 93° 21′ and 95° 25′ E long, and covering an area of 2855 square miles It is bounded on the N and E by Lakhimpur district, on the S by independent Nágá territory, and on the W by the Nowgong and Nágá Hills districts Sibsagar consists of a level plain, much overgrown with grass and jungle, and intersected by numerous tributaries of the Brahmaputra It is divided by the little stream Disai into two tracts, which differ in soil and general appearance The surface of the eastern portion is very flat, the general level being broken only by the long lines of embankments raised by the Aham kings to serve both as roadways and as a protection against floods The soil consists of a heavy loam of a whitish colour, which is well adapted for rice cultivation West of the Disai, though the surface soil is of the same character, the general aspect is diversified by the protrusion of the subsoil, which consists of a stiff clay abounding in iron nodules, and is furrowed by frequent ravines and water-courses, which divide the cultivable fields into innumerable small sunken patches or *holas* The chief river is the Brahmaputra, which is navigable throughout the year by steamers and large native craft The navigable tributaries of the Brahmaputra comprise the Dhaneswari, the Burí Dihing, the Disang, and the Dikhu, all flowing in a northerly direction from the Nágá Hills Included within the district is the island of Maguli, which is said to have been formed by the silt brought down by the Subansiri river from the Himálayas and deposited in the wide channel of the Brahmaputra Coal, iron, petroleum, and salt are found in the district Wild beasts of all kinds abound, including the elephant, rhinoceros, tiger, buffalo, and deer The climate, like that of the rest of the Assam valley, is comparatively mild and temperate, and the average annual rainfall is about 94 inches

In 1881 the population of Sibságar was 370,274 (males 195,194, females 175,080), of whom Hindus numbered 339,663, Mohammedans 15,665, hill tribes 13,829, and Christians 804 The only place of more than 5000 inhabitants is SIBSAGAR (see below) Of the total area 359,225 acres were under cultivation in 1883-84, besides 78,710 acres of forests The staple product is rice, which yields two crops in the year, tea is also extensively grown, Sibságar being second only to Cachar among the tea-growing districts of India, other crops include food-grains, pulses, oil-seeds, sugar-cane, and cinchona The local industries are limited to the weaving of silk and cotton cloth, the making of brass and bell-metal utensils, and coarse pottery The principal exports are tea, silk, mustard-seed, cotton, and jungle products, the imports include salt, oil, opium, piece-goods, and miscellaneous hardware

On the decline of the Aham dynasty Sibságar, with the rest of the Assam valley, fell into the hands of the Burmese They were expelled by the British in 1823, and in the following year the valley was annexed to British India The British, however, were indisposed to undertake the responsibilities of administration beyond what seemed absolutely necessary The country now forming Sibságar district, together with the southern portion of Lakhimpur, was placed under the rule of Raja Purandhar Sinh, on his agreeing to pay an annual tribute of £5000 Owing to the raja's misrule, Sibságar was reduced to a state of great poverty, and, as he was unable to pay the annual tribute, the territories were resumed by the Government of India, and in 1838 Sibságar was placed under the direct management of a British officer The tea industry soon brought back prosperity, and the Sibságar peasants now rank among the most contented and wealthy in Assam

SIBSÁGAR, chief town and civil headquarters of the above district, is situated about 11 miles south from the Brahmaputra, being picturesquely placed around a magnificent tank covering an area of 114 acres Besides the houses of the civil officials, it possesses a straggling bazaar, in which a brisk business is carried on during the cold season with the neighbouring hill tribes In 1881 the population of the town was 5868

SIBYL Certain women who prophesied under the inspiration of a deity were called by the Greeks Sibyls The inspiration manifested itself outwardly in distorted features, foaming mouth, and frantic gestures The notion that hysterical, convulsive, and epileptic affections are proof of divine inspiration has been common all over the world (see Tylor's *Primitive Culture*, ii p 131 *sq*) Homer does not refer to a Sibyl, nor does Herodotus. The first Greek writer, so far as we know, who does so is Heraclitus (flourished about 500 B C) As to the number and native countries of the Sibyls much diversity of opinion prevailed, as is evinced by the contradictory statements of ancient writers Aristophanes, Plato, and the author of the Θαυμάσια ἀκούσματα, attributed to Aristotle, appear to know of only one Sibyl Heraclides Ponticus, a pupil of Plato, seems to be the first writer who distinguished several Sibyls,—the Erythræan, the Phrygian, and the Hellespontine Later writers speak of two, three, four, eight, ten, and twelve Pausanias (x 12) enumerates four According to him, the oldest was the Libyan[1] Sibyl, a daughter of Zeus and Lamia The second was Herophile, a native of Marpessus or Erythræ in the Troad, she lived mostly in Samos, but visited Clarus, Delos, and Delphi She lived before the Trojan War, which she is said to have predicted The third was the Sibyl of Cumæ in Italy, and the fourth was a Hebrew Sibyl called Sabbe, others, however, called the last-mentioned Sibyl a Babylonian or Egyptian According to Plutarch (*De Pyth Orac*, 9), the first Sibyl was she of Delphi Varro enumerates ten Sibyls,—the Persian, Libyan, Delphic, Cimmerian, Erythræan, Samian, Cuman, Hellespontine, Phrygian, and Tiburtine The Sibyl of whom we hear most was the Sibyl of Cumæ, whom Æneas consulted before his descent to Hades She was supposed to live 1000 years It was she who sold to Tarquin the Proud the Sibylline books She first offered him nine, when he refused them, she burned three and offered him the remaining six at the same price, when he again refused them, she burned three more and offered him the remaining three still at the same price Tarquin then bought them. They were entrusted to a college of fifteen men (*quindecemviri sacris faciundis*), who preserved them and consulted them on occasions of national danger It would seem that they were consulted with a view to discover, not exact predictions of definite future events, but the religious observances necessary to avert extraordinary calamities and expiate prodigies They were written in hexameter verse and in Greek, hence the college of curators was always assisted by two Greek interpreters The books were kept in the temple of Jupiter on the Capitol and shared the destruction of the temple by fire in 83 B C After the restoration of the temple the senate sent ambassadors in 76 to Erythræ to collect the oracles afresh and they brought back about 1000 verses, others were collected in Ilium, Samos, Sicily, Italy, and Africa In the year 12 Augustus sought out and burned a great many spurious oracles and subjected the Sibylline books to a critical revision, they were then placed by him in the temple of Apollo Patrous, where we hear of them still existing in 363. They seem to have been burned by Stilicho shortly after 400 According to the researches of Klausen (*Æneas und die Penates*,

[1] There is a gap in the text of Pausanias, and his meaning is not quite certain

Hamburg, 1839-40), the oldest collection of Sibylline oracles appears to have been made about the time of Solon and Cyrus at Gergis on Mount Ida in the Troad; it was attributed to the Sibyl of Marpessus and was preserved in the temple of Apollo at Gergis. Thence it passed to Erythræ, where it became famous. It was this very collection, it would appear, which found its way to Cumæ and from Cumæ to Rome.

The collection of so called Sibylline oracles which has descended to us is obviously spurious, bearing marks of Jewish and Christian origin. Ewald assigns the oldest of them to about 124 B.C. and the latest to about 668-672 A.D. They have been edited by Friedlieb (Leipsic, 1852) and Alexandre (2d ed., Paris, 1869). For an examination of the different lists of Sibyls, see E. Maass, *De Sibyllarum Indicibus*, Berlin, 1879.

SIBYLLINE BOOKS. See APOCALYPTIC LITERATURE, vol. ii. p. 177.

SICILY

PART I.—HISTORY.

Geographical position.

SICILY, slightly surpassed by Sardinia in superficial extent, is, in its geographical and historical position, the greatest island of the Mediterranean. As such it holds among European lands a position answering to that of Great Britain, the greatest island of the Ocean, and the events of their history have at more than one period brought the two islands into a close connexion with one another. The geographical position of Sicily (see vol. xiii. pl. IV.) led almost as a matter of necessity to its historical position, as the meeting-place of the nations, the battle-field of contending races and creeds. Lying nearer to the mainland of Europe and nearer to Africa than any other of the great Mediterranean islands, Sicily is, next to Spain, the connecting link between those two quarters of the world. It stands also as a breakwater between the eastern and western divisions of the Mediterranean Sea. In præ-historic times those two divisions were two vast lakes, and Sicily is a surviving fragment of the land which once parted the two united seas and united the continents which are now distinct. That Sicily and Africa were once joined we know only from modern scientific research; that Sicily and Italy were once joined is handed down in legend, unless the legend itself is not rather an obvious guess. Sicily then, comparatively near to Africa, but much nearer to Europe, has been a European land, but one specially open to invasion and settlement from Africa. Dividing the eastern and western basins of the Mediterranean, it has been a part of western Europe, but a part which has had specially close relations with eastern Europe. It has stood at various times in close connexion with Greece, with Africa, and with Spain; but its closest connexion has been with the neighbouring land of Italy. Still Italy and Sicily are thoroughly distinct lands, and the history of Sicily should never be looked on as simply part of the history of Italy. Lying thus between Europe and Africa, Sicily has been the battle-field of Europe and Africa. That is to say, it has been at two separate periods the battle-field of Aryan and Semitic man. In the later stage of the strife it has been the battle-field of Christendom and Islam. This history Sicily shares with Spain to the west of it and with Cyprus to the east. And with Spain the island has had several direct points of connexion. There was in all likelihood a near kindred between the earliest inhabitants of the two lands. In later times Sicily was ruled by Spanish kings, both alone and in union with other kingdoms. The connexion with Africa has consisted simply in the settlement of conquerors from Africa at two periods, first Phœnician, then Saracen. On the other hand Sicily has been more than once made the road to African conquest and settlement, both by Sicilian princes and by the Roman masters of Sicily. The connexion with Greece, the most memorable of all, has consisted in the settlement of many colonies from old Greece, which gave the island the most brilliant part of its history, and which made the greater part practically Greek. This Greek element was strengthened at a later time by the long connexion of Sicily with the Eastern, the Greek-speaking, division of the Roman empire. And the influence of Greece on Sicily has been repaid in more than one shape by Sicilian rulers who have at various times held influence and dominion in Greece and elsewhere beyond the Hadriatic (Adriatic). The connexion between Sicily and Italy begins with the primitive kindred between some of the oldest elements in each. Then came the contemporary Greek colonization in both lands. Then came the tendency in the dominant powers in southern Italy to make their way into Sicily also. Thus the Roman occupation of Sicily ended the struggle between Greek and Phœnician. Thus the Norman occupation ended the struggle between Greek and Saracen. Of this last came the long connexion between Sicily and southern Italy under several dynasties. Lastly comes the late absorption of Sicily in the modern kingdom of Italy. The result of these various forms of Italian influence has been that all the other tongues of the island have died out before the advance of a peculiar dialect of Italian. In religion again both Islam and the Eastern form of Christianity have given way to its Italian form. The connexion with England amounts to this, that both islands came under Norman dynasties, that under Norman rule the intercourse between the two countries was extremely close, and that the last time that Sicily was the seat of a separate power it was under British protection.

The Phœnician, whether from old Phœnicia or from Carthage, came from lands which were mere strips of sea-coast with a boundless continent behind them. The Greek of old Hellas came from a land of islands, peninsulas, and inland seas. So did the Greek of Asia, though he had, like the Phœnician, a vast continent behind him. In Sicily they all found a strip of sea-coast with an inland region behind; but the strip of sea-coast was not like the broken coast of Greece and Greek Asia, and the inland region was not a boundless continent like Africa or Asia. In Sicily therefore the Greek became more continental, and the Phœnician became more insular, than either nation had been in its own land. Neither people ever occupied the whole island; the presence of the other hindered either from occupying even the whole of the coast, nor was either people ever able to spread its dominion over the earlier inhabitants very far inland. Sicily thus remained a world of its own, with interests and disputes of its own, and divided among inhabitants of various nations. The history of the Greeks of Sicily is constantly connected with the history of old Hellas, but it runs a separate course of its own. Their position answers somewhat to that of the English people of the United States with regard to the mother-country of Great Britain. It differs in this, that the independence of the Greek cities in Sicily was not the result of warfare with the mother-country. Otherwise the analogy would have been almost exact, if France or Spain had kept its old power in North America. The Phœnician element ran an opposite course, as the independent Phœnician settlements in Sicily sank into dependencies of Carthage. The entrance of the Romans put an end to all practical independence on the part of either nation. But Roman ascendency did not affect Greeks and Phœnicians in the same way. Phœnician

life gradually died out. But Roman ascendency nowhere crushed out Greek life where it already existed, and in some ways it strengthened it. Though the Greeks never spread their dominion over the island, they made a peaceful conquest of it. This process was in no way hindered by the Roman dominion; the work of assimilation went on still faster.

Original inhabitants.

The question now comes, Who were the original inhabitants of Sicily? The island itself, Σικελία, *Sicilia*, plainly takes its name from the Sikels (Σικελοί, *Siculi*), a people whom we find occupying a great part of the island, chiefly east of the river Gela. They appear also in Italy, in the toe of the boot, and older history or tradition spoke of them as having in earlier days held a large place in Latium and elsewhere in central Italy. They were believed to have crossed the strait into the island about 300 years before the beginning of the Greek settlements, that is to say in the 11th century B.C. They found in the island a people called Sikans (Σικανοί, *Sicani*), whose name might pass for a dialectic form of their own, did not the ancient writers straitly affirm them to be a wholly distinct people, akin to the Iberians. Sikans also appear with the Ligurians among the early inhabitants of Italy (Virg., *Æn.*, vii. 795, viii. 328, xi. 317, and Servius's note). It is possible then that the likeness of name is accidental, that the Sikels belonged to the same branch of the Aryan family as the Italians, while Sikans, like Ligurians and Iberians and the surviving Basques, belonged to the earlier non-Aryan population of western Europe. But, whatever the origin of either, in the history of the island Sikans and Sikels appear as two distinct nations with a clear geographical boundary. And we may venture to set down the Sikels as undeveloped Latins, who were hindered by the coming of the Greeks from reaching the same independent national life as their kinsfolk in Italy, and, instead of so doing, were gradually Hellenized. On the other hand, some Sikel elements made their way into the Greek life of Sicily. That the Sikels spoke a tongue closely akin to Latin is plain from several Sikel words which crept into Sicilian Greek, and from the Sikeliot system of weights and measures,—utterly unlike anything in old Greece. When the Greek settlements began, the Sikans had hardly got beyond the life of villages on hill-tops (Dion. Hal., v. 6), more truly perhaps villages with places of shelter on the hill-tops. The more advanced Sikels had their hill-forts also, but they had learned the advantages of the sea, and they already had settlements on the coast when the Greeks came. As we go on, we hear of both Sikel and Sikan towns; but we may suspect that any approach to true city life was owing to Greek influences. Neither people grew into any form of national unity. There was neither common king nor common confederation either of Sikels or of Sikans. They were therefore partly subdued, partly assimilated, slowly, but without much effort.

In the north-east corner of the island we find a small territory occupied by a people who seem to have made much greater advances towards civilized life. The Elymoi were a people of uncertain origin, but they claimed a mixed descent, partly Trojan, partly Greek. Thucydides however unhesitatingly reckons them among barbarians. They had considerable towns, as Segesta (the Greek Egesta) and Eryx, and the whole history, as well as the remains, of Segesta, shows that Greek influences prevailed among them very early. In short, we find in the island three nations distinct from the Greeks, two of which at least easily adopted Greek culture and came in the end to pass for Greeks by adoption.

Early Phœnician settlements.

But, as we have already seen, the Greeks were not the first colonizing people who were drawn to the great island. As in Cyprus and in the islands of the Ægæan, the Phœnicians were before them. And it is from this presence of the highest forms of Aryan and of Semitic man that the history of Sicily draws its highest interest. Of Phœnician occupation there are two, or rather three, marked periods. We must always remember that Carthage —the new city—was one of the latest of Phœnician foundations, and that the days of the Carthaginian dominion show us only the latest form of Phœnician life. Phœnician settlement in Sicily began before Carthage became great, perhaps before Carthage came into being. A crowd of small settlements from the old Phœnicia, settlements for trade rather than for dominion, factories rather than colonies, grew up on promontories and small islands all round the Sicilian coast. These were unable to withstand the Greek settlers, and the Phœnicians of Sicily withdrew step by step to form three considerable towns in the north-west corner of the island,—Motye, Soloeis or Solunto, on a hill overhanging the sea on the north coast, and the great Panormos, the *all-haven* (see PALERMO), the city destined to be, in two different periods of the world's history, the head of Semitic power in Sicily.

Greek colonization.

Our earlier notices of Sicily, of Sikels and Sikans, in the Homeric poems and elsewhere, are vague and legendary. Both races appear as given to the buying and selling of slaves (*Od.*, xx. 383, xxiv. 30, 210). The intimate connexion between old Hellas and Sicily begins with the foundation of the Sicilian Naxos by Chalkidians of Euboia under Theokles, which is assigned to the year 735 B.C. The site, a low promontory on the east coast, immediately below the height of Tauromenion, marks an age which had advanced beyond the hill-fortress and which thoroughly valued the sea. The next year Corinth began her system of settlement in the west. Korkyra (Corcyra), the path to Sicily, and Syracuse on the Sicilian coast were planted as parts of one enterprise. From this time, for about 150 years, Greek settlement in the island, with some intervals, goes steadily on. Both Ionian and Dorian colonies were planted, both from the older Greek lands and from the older Sicilian settlements. The east coast, nearest to Greece and richest in good harbours, was occupied first. Here, between Naxos and Syracuse, arose the Ionian cities of Leontinoi and Katana (Catina, Catania) and the Dorian Megara by Hybla. Settlement on the south-western coast began about 688 B.C. with the joint Cretan and Rhodian settlement of Gela, and went on in the foundation of Selinous (the most distant Greek city on this side), of Kamarina (Camarina), and in 588 B.C. of the Geloan settlement of Akragas (Agrigentum, Girgenti), planted on a high hill, a little way from the sea, which became the second city of Hellenic Sicily. On the north coast the Ionian Himera was the only Greek city in Sicily itself, but the Knidians founded Lipara in the Æolian Islands. At the north-east corner, opposite to Italy, and commanding the strait, arose Zankle, a city of uncertain date and mixed origin, better known under its later name of Messana (Messene, Messina).

Thus nearly all the east coast of Sicily, a great part of the south coast, and a much smaller part of the north, passed into the hands of Greek settlers,—Sikeliots (Σικελιῶται), as distinguished from the native Sikels. This was one of the greatest advances ever made by the Greek people. The Greek element began to be predominant in the island. Among the earlier inhabitants the Sikels were already becoming adopted Greeks. Many of them gradually sank into a not wholly unwilling subjection as cultivators of the soil under Greek masters,—a relation embodied perhaps in the legend that a native Sikel prince led the Greek settlers to the foundation of Megara. But there were also independent Sikel towns in the interior, and there was a strong religious intercommunion between the two races. Sikel Henna (Enna, Castrogiovanni) is the special seat of the worship of Demeter and her daughter. The Sikans, on

7th cent-454 B C the other hand, seem more distinct and more steadily hostile The Phœnicians, now shut up in one corner of the island, with Selinous on one side and Himera on the other founded right in their teeth, are bitter enemies, but the time of their renewed greatness under the headship of Carthage has not yet come The 7th century B C and the early part of the 6th were a time in which the Greek cities of Sicily had their full share in the general prosperity of the Greek colonies everywhere For a while they outstripped the cities of old Greece Their political constitutions were aristocratic, that is, the franchise was confined to the descendants of the original settlers, round whom an excluded body (δῆμος or *plebs*) was often growing up The ancient kingship was perhaps kept on or renewed in some of the Sikeliot and Italiot towns, but it is more certain that civil dissensions led very early to the rise of tyrants The first and most famous is Phalaris of Akragas, whose exact date is uncertain, whose letters are now cast aside, and whose brazen bull has been called in question, but who clearly rose to power very soon after the foundation of Akragas Under his rule the city at once sprang to the first place in Sicily, and he was the first Sikeliot ruler who held dominion over two Greek cities, Akragas and Himera This time of prosperity was also a time of intellectual progress To say nothing of lawgivers like Charondas, the line of Sikeliot poets began early, and the circumstances of the island, the adoption of many of its local traditions and beliefs—perhaps a certain intermingling of native blood—gave the intellectual life of Sicily a character in some things distinct from that of old Hellas Stesichoros of Himera (*c* 632-556 B C) holds a great place among the lyric poets of Greece, and some place in the political history of Sicily as the opponent of Phalaris The architecture and sculpture of this age have also left some of their most remarkable monuments among the Greek cities of Sicily (see SYRACUSE) The remains of the old temples of Selinous, attributed to the 7th century B C, show us the Doric style in its earlier state, and the sculptures of their metopes (preserved at Palermo) are as distinctly grotesque as any Romanesque sculpture of the 11th or 12th century In both ages the art of the builder was far in advance of that of the ornamental carver

Prosperous Greek period

This first period of Sicilian history lasts as long as Sicily remains untouched from any non-Hellenic quarter outside, and as long as the Greek cities in Sicily remain as a rule independent of one another A change begins in the 6th century and is accomplished early in the 5th The Phœnician settlements in Sicily become dependent on Carthage, whose growing power begins to be dangerous to the Greeks of Sicily Meanwhile the growth of tyrannies in the Greek cities was beginning to group several towns together under a single master, and thus to increase the greatness of particular cities at the expense of their freedom Thus Theron of Akragas (488-472), who bears a good character there, acquired also, like Phalaris, the rule of Himera One such power held dominion both in Italy and Sicily Anaxilaos of Rhegion, by a long and strange tale of treachery, occupied Zankle and changed its name to Messana But the greatest of the Sikeliot powers began at Gela in 505, and was in 485 translated by Gelon to Syracuse That city now became the centre of a greater dominion over both Greeks and Sikels than the island had ever before seen But Gelon, like several later tyrants of Syracuse, takes his place—and it is the redeeming point in the position of all of them—as the champion of Hellas against the barbarian The great double invasion of 480 B C was planned in concert by the barbarians of the East and the West (Diod, xi 20, schol on Pind, *Pyth*, i 146, Grote, v 294) While the Persians threatened old Greece, Carthage threatened the Greeks of Sicily There were Sikeliots who played the part of the Medizers in Greece Selinous was on the side of Carthage, and the coming of Hamilkar was immediately brought about by a tyrant of Himera driven out by Theron But the united power of Gelon and Theron crushed the invaders in the great battle of Himera, won, men said, on the same day as Salamis, and the victors of both were coupled as the joint deliverers of Hellas (Herod, vii 165-167, Diod, xx 20-25, Pind, *Pyth*, i 147-156, Simonides, fr 42, Polyainos, i 27) But, while the victory of Salamis was followed by a long war with Persia, the peace which was now granted to Carthage stayed in force for seventy years Gelon was followed by his brother Hieron (478-467), the special subject of the songs of Pindar Akragas meanwhile flourished under Theron, but a war between him and Hieron led to slaughter and new settlement at Himera These transplantings from city to city began under Gelon and went on under Hieron They made speakers in old Greece (Thuc, vi 17) contrast the permanence of habitation there with the constant changes in Sicily Hieron won the fame of a founder by peopling Katana with new citizens, and changing its name to Aitna

Growth of tyrannies

Gelon

Hieron I

None of these tyrannies were long-lived The power of Theron fell to pieces under his son Thrasydaios When the power of Hieron passed in 467 B C to his brother Thrasyboulos the freedom of Syracuse was won by a combined movement of Greeks and Sikels, and the Greek cities gradually settled down as they had been before the tyrannies, only with a change to democracy in their constitutions The mercenaries who had received citizenship from the tyrants were settled at Messana About fifty years of general prosperity followed We have special pictures of almost incredible wealth and luxury at Akragas, chiefly founded on an African trade Moreover art, science, poetry, had all been encouraged by the tyrants, and they went on flourishing in the free states To these was now added the special growth of freedom, the art of public speaking Epicharmos (540-450), carried as a babe to Sicily, is a link between native Sikeliots and the strangers invited by Hieron, as the founder of the local Sicilian comedy, he ranks among Sikeliots After him Sophron of Syracuse gave the Sicilian *mimes* a place among the forms of Greek poetry But the intellect of free Sicily struck out higher paths Empedokles of Akragas is best known from the legends of his miracles and of his death in the fires of Ætna, but he was not the less philosopher, poet, and physician, besides his political career It is vaguely implied (Diog Laert, viii 2, 9) that he refused an offer of the tyranny or of authority in some shape Gorgias of Leontinoi (*c* 480-375) had a still more direct influence on Greek culture, as father of the technical schools of rhetoric throughout Greece Architecture too advanced, and the Doric style gradually lost somewhat of its ancient massiveness The temple at Syracuse which is now the metropolitan church belongs to the earlier days of this time It is followed by the later temples at Selinous, among them the temple of Zeus, which is said to have been the greatest in Sicily, and by the wonderful series at Akragas, crowned by the Olympian temple, with its many architectural singularities This, like its fellow at Selinous, was not fully finished at the time of the Carthaginian inroad at the end of the century

During this time of prosperity there was no dread of Carthaginian inroads But in 454 B C we read of a war between Segesta and Lilybaion (Lilybæum) There was as yet no town of Lilybaion, but, if the war was waged against any Phœnician settlement, the fact is to be noticed, as hitherto Segesta has been allied with the Phœnicians against the Greeks Far more important are our notices of the earlier inhabitants For now comes the great Sikel

Condition of Sikels and Sikans

movement under Douketios, who, between force and persuasion, came nearer towards uniting his people into one body than had ever been done before From his native hill-top of Menai, rising above the lake dedicated to the Palikoi, the native deities whom Sikels and Greeks alike honoured, he brought down his people to the new city of Palikai in the plain His power grew, and Akragas could withstand him only by the help of Syracuse Alternately victorious and defeated, spared by Syracuse (451), sent to be safe at Corinth, he came back to Sicily only to form greater plans than before War between Akragas and Syracuse enabled him to carry out his schemes, and, with the help of another Sikel prince who bore the Greek name of Archomides, he founded Kale Akte on the northern coast But his work was cut short by his death in 440, the hope of the Sikel people now lay in assimilation to their Hellenic neighbours Douketios's own foundation of Kale Akte lived on, and we presently hear of Sikel towns under kings and tyrants, all marking an approach to Greek life Roughly speaking, while the Sikels of the plain country on the east coast became subject to Syracuse, most of those in other parts of the island remained independent Of the Sikans we hear less, but Hykkara in the north-west was an independent Sikan town on bad terms with Segesta On the whole, setting aside the impassable barrier between Greek and Phœnician, other distinctions of race within the island were breaking down through the spread of the Hellenic element Segesta was on familiar terms with both Greek and Phœnician neighbours, and had the right of intermarriage (Thuc, vi 6) with Hellenic Selinous Among the Greek cities themselves the distinction between the Dorian and the Ionian or Chalkidian settlements is still keenly felt The Ionian is decidedly the weaker element, and it was most likely owing to the rivalry between the two great Dorian cities of Syracuse and Akragas that the Chalkidian towns were able to keep any independence at all

Up to this time the Italiot and Sikeliot Greeks have formed part of the general Greek world, while within that world they have formed a world of their own, and Sicily has again formed a world of its own within that Wars and conquests between Greeks and Greeks, especially on the part of Syracuse, though not wanting, have been on the whole less constant than in old Greece It is even possible to appeal to a vein of local Sicilian patriotism, to preach a kind of Monroe doctrine by which Greeks from other lands should be shut out as strangers (ἀλλόφυλοι, Thuc, vi 61, 74) Presently this state of Sicilian isolation was broken in upon by the great Peloponnesian War The Sikeliot cities were drawn into alliance with one side or the other, till the main interest of Greek history gathers for a while round the Athenian attack on Syracuse At the very beginning of the war the Lacedæmonians looked for help from the Dorian Sikeliots But the first active

Interference of Athens

intervention came from the other side Conquest in Sicily was a favourite dream at Athens (Thuc, vi 1, cf i 48, and Diod, xii 54), with a view to wider conquest or influence in the western Mediterranean An opportunity for Athenian interference was found in 427 in a quarrel between Syracuse and Leontinoi and their allies Leontinoi craved help from Athens on the ground of Ionian kindred Her envoy was Gorgias, his peculiar style of rhetoric was now first heard in old Greece (Diod, xii 53, 54), and his pleadings were successful For several years from this time (427-422) Athens plays a part, chiefly unsuccessful, in Sicilian affairs But the particular events are of little importance, except as leading the way to the greater events that follow The steadiest ally of Athens was the Italiot Rhegion, Messana, with its mixed population, was repeatedly won and lost, the Sikel tributaries of Syracuse gave zealous help to the Athenians But in 424 all the Sikeliot and most of the Italiot cities, under the guidance of Hermokrates of Syracuse, who powerfully set forth the doctrine of Sikeliot, perhaps of Sicilian unity, agreed on a peace Presently an internal disturbance at Leontinoi led to annexation by Syracuse This gave the Athenians a pretext for another attempt in 422 Little came of it, though Athens was joined by the Doric cities of Kamarina and Akragas, clearly out of jealousy towards Syracuse For several years the island was left to itself 424 413 B C

The far more memorable interference of Athens in Sicilian affairs in the year 415 was partly in answer to the cry of the exiles of Leontinoi, partly to a quite distinct appeal from the Elymian Segesta That city, an ally of Athens, asked for Athenian help against its Greek neighbour Selinous In a dispute, partly about boundaries, partly about the right of intermarriage between the Hellenic and the Hellenizing city, Segesta was hard pressed She vainly asked for help at Akragas—some say at Syracuse (Diod, xii 82)—and even at Carthage The last appeal was to Athens But the claims of Segesta and Leontinoi are soon forgotten in the struggle for life and death between Syracuse and Athens

Athenian expedition

The details of the great Athenian expedition (415-413) belong partly to the political history of Athens, partly to that of SYRACUSE (*q v*) But its results make it a marked epoch in Sicilian history, and the Athenian plans, if successful, would have changed the whole face of the West If the later stages of the struggle were remarkable for the vast number of Greek cities engaged on both sides, and for the strange inversion of relations among them on which Thucydides (vii 57, 58) comments, the whole war was yet more remarkable for the large entrance of the barbarian element into the Athenian reckonings The war was undertaken on behalf of Segesta, the Sikels gave Athens valuable help, the greater barbarian powers out of Sicily also came into play Some help actually came from Etruria But Carthage was more far-sighted If Syracuse was an object of jealousy, Athens, succeeding to her dominion, creating a power too nearly alike to her own, would have provoked far greater jealousy So Athens found no active support save at Naxos and Katana, though Akragas, if she would not help the invaders, at least gave no help to her own rival The war is instructive in many ways it reminds us of the general conditions of Greek seamanship when we find that Korkyra was the meeting-place for the allied fleet, and that Syracuse was reached only by a coasting voyage along the shores of Greek Italy We are struck also by the low military level of the Sicilian Greeks The Syracusan heavy-armed are as far below those of Athens as those of Athens are below those of Sparta The *quasi*-continental character of Sicily causes Syracuse, with its havens and its island, to be looked on, in comparison with Athens, as a land power (ἠπειρῶται, Thuc, vii 21) That is to say, the Sikeliot level represents the general Greek level as it stood before the wars in which Athens won and defended her dominion The Greeks of Sicily had had no such military practice as the Greeks of old Greece, but an able commander could teach both Sikeliot soldiers and Sikeliot seamen to outmanœuvre Athenians The main result of the expedition, as regards Sicily, was to bring the island more thoroughly into the thick of Greek affairs Syracuse, threatened with destruction by Athens, was saved by the zeal of her metropolis Corinth in stirring up the Peloponnesian rivals of Athens to help her Gylippos came, the second Athenian fleet came and perished Syracuse was saved, all chance of Athenian dominion in Sicily or elsewhere in the West came to an end Syracuse repaid the debt by good service to the Peloponnesian cause, and from that

413-392 B.C.

time the mutual influence of Sicily and old Greece upon one another is far stronger than in earlier times.

Phœnician invasion under Hannibal.

But before the war in old Greece was over, seventy years after the great victory of Gelon (410), the Greeks of Sicily had to undergo barbarian invasion on a vaster scale than ever. The disputes between Segesta and Selinous called in these enemies also. Carthage stepped in as the ally of Segesta, the enemy of her old ally Selinous. Her leader was Hannibal, grandson and avenger of the Hamilkar who had died at Himera. In 408, at the head of a vast mercenary host, he sailed to Sicily, attacked Selinous, and stormed the town after a murderous assault of nine days, while the other Sikeliot cities, summoned to help, were still lingering. The walls and temples were overthrown, the mass of the people were massacred, the few who escaped were allowed to return to the dismantled site as tributaries of Carthage, and the city never recovered its old greatness. Thence Hannibal went on to Himera, with the special mission of avenging his grandfather. By this time the other Greek cities were stirred to help, while Sikels and Sikans joined Hannibal, the strife was distinctly a strife of Greeks and barbarians. At last Himera was stormed, and 3000 of its citizens were solemnly slaughtered on the spot where Hamilkar had died. Himera ceased to exist, but the Carthaginians founded the new town of Thermai (Termini) not far off, to which the name is sometimes laxly applied. The Phœnician possessions in Sicily now stretched across the island from Himera to Selinous. The next victim was Akragas, its defenders, natives and allies, quarrelled among themselves, the mass of the people forsook the city, and found shelter at Gela and elsewhere. The few who were left were slaughtered, the town was sacked and the walls destroyed. Akragas was presently restored, and it has lived on to this day, but it never recovered its old greatness.

Dionysios I.

Meanwhile the revolutions of Syracuse affected the history of Sicily and of the whole Greek world. Dionysios the tyrant began his reign of thirty eight years in the first months of 405. Almost at the same moment, the new Carthaginian commander, Himilkon, attacked Gela and Kamarina. Dionysios, coming to the help of Gela, was defeated, and was charged with treachery. He now made the mass of the people of both towns find shelter at Syracuse. But now the plague led Himilkon to ask for peace. Carthage was confirmed in her possession of Selinous, Himera, and Akragas, with some Sikan districts which had opposed her. The people of Gela and Kamarina were allowed to occupy their unwalled towns as tributaries of Carthage. Leontinoi, latterly a Syracusan fort, as well as Messana and all the Sikels, were declared independent, while Dionysios was acknowledged as master of Syracuse. No war was ever more grievous to freedom and civilization. More than half Sicily was now under barbarian dominion, several of its noblest cities had perished, and a tyrant was established in the greatest. The 5th century B.C., after its central years of freedom and prosperity, ended in far deeper darkness than it had begun. The minuter account of Dionysios belongs to Syracusan history, but his position, one unlike anything that had been before seen in Sicily or elsewhere in Hellas, forms an epoch in the history of Europe. His only bright side is his championship of Hellas against the Phœnician, and this is balanced by his settlements of barbarian mercenaries in several Greek cities. Towards the native races his policy varied according to momentary interests, but on the whole his reign tended to bring the Sikels more and more within the Greek pale. His dominion is Italian as well as Sicilian, his influence, as an ally of Sparta, is important in old Greece, while, as a hirer of mercenaries everywhere, he had wider relations than any earlier Greek with the nations of western Europe. He further opened new fields for Greek settlement on both sides of the Hadriatic. In short, under him Sicily became for the first time the seat of a great European power, while Syracuse, as its head, became the greatest of European cities. His reign was unusually long for a Greek tyrant, and his career furnished a model for other rulers and invaders of Sicily. With him in truth begins that wider range of Greek warfare, policy, and dominion which the Macedonian kingdoms carry on. The master of such a dominion becomes the improver of the military art. With him begins the employment of ships greater than the old triremes, of more effective engines in sieges, and that combined use of troops of various arms and nations which Alexander carried to perfection.

His wars with Carthage, &c.

The reign of Dionysios (405-367) is divided into marked periods by four wars with Carthage, in 397-396, 392, 383, and 368. In the first war his home power was all but overthrown, but he lived through the storm, and extended his dominion over Naxos, Katana, and Leontinoi. All three perished as Greek cities. Katana was the first Sikeliot city to receive a settlement of Campanian mercenaries, while others settled in non-Hellenic Entella. Naxos was settled by Sikels, Leontinoi was again merged in Syracuse. Now begin the dealings of Dionysios with Italy, where the Rhegines, kinsmen of Naxos and Katana, planned a fruitless attack on him in common with Messana. He then sought a wife at Rhegion, but was refused with scorn, while Lokroi (Locri) gladly gave him Doris. The two cities afterwards fared accordingly. In the first war with Carthage, the Greek cities under Carthaginian dominion or dependence helped him, so did Sikans and Sikels, which last had among them some stirring leaders, Elymian Segesta clave to Carthage. Dionysios took the Phœnician stronghold of Motye, but Himilkon recovered it, destroyed Messana, founded the hill-town of Tauromenion (Taormina) above Naxos for Sikels who had joined him, defeated the fleet of Dionysios, and besieged Syracuse. Between invasion and home discontent, the tyrant was all but lost, but the Spartan Pharakidas stood his friend, the Carthaginians again suffered from pestilence, and Himilkon went away defeated, taking with him his Carthaginian troops and forsaking his allies. Gela, Kamarina, Himera, Selinous, Akragas itself, now passed into the dependent alliance of Dionysios. The Carthaginian dominion was cut down to what it had been before Hannibal's invasion. The lord of Syracuse had grown at the cost of Greek and barbarian alike.

He planted mercenaries at Leontinoi, conquered some Sikel towns, central Henna among them, and made alliances with others. He restored Messana, peopling it with motley settlers, among whom were some of the old Messenians from Peloponnesos. But the Spartan masters of the old Messenian land grudged this possible beginning of a new Messenian power. Dionysios therefore moved his Messenians to a point on the north coast, where they founded Tyndaris. He clearly had a special eye to that region. He took the Sikel Kephaloidion (Cefalù), and even the old Phœnician border-fortress of Solous was betrayed to him. He beat back a Rhegine expedition, but his advance was checked by a failure to take the new Sikel settlement of Tauromenion. His enemies of all races now declared themselves. Many of the Sikels forsook him, Akragas declared herself independent, Carthage herself, stirred by the loss of Solous, again took the field.

The Punic war of 392-391 was not very memorable. Both sides failed in their chief enterprises, and the main interest of the story comes from the glimpses which we get of the Sikel states. Most of them joined the Cartha-

ginian leader Mago, but he was successfully withstood at Agyrion by Agyris, the ally of Dionysios, who is described as a tyrant second in power to Dionysios himself This way of speaking would imply that Agyrion had so far advanced in Greek ways as to run the usual course of a Greek commonwealth The two tyrants drove Carthage to a peace by which she abandoned all her Sikel allies to Dionysios This time he took Tauromenion and settled it with his mercenaries For new colonists of this kind the established communities of all races were making way The transportations under the older tyrants had been movements of Greeks from one Greek site to another Now all races are confounded

Dionysios, now free from Phœnician warfare, gave his mind to enterprises which raised his power to its greatest height In the years 390-387 he warred against the Italiot cities in alliance with their Lucanian enemies Rhegion, Kroton (Croton), the whole toe of the boot, were conquered Their lands were given to Lokroi, their citizens were taken to Syracuse, sometimes as slaves, sometimes as citizens The master of barbarians fell below the lowest Hellenic level when he put the brave Rhegine general Phyton to a lingering death, and in other cases imitated the Carthaginian cruelty of crucifixion Conqueror of southern Italy, he turned his thoughts yet further, and became the first ruler of Sicily to stretch forth his hands towards the eastern peninsula In the Hadriatic he helped Hellenic extension He planted directly and indirectly some settlements in Apulia, while Syracusan exiles founded the more famous Ankon or Ancona On the east coast he founded Lissos, he helped the Parians in their settlements of Issa and Pharos, he took into his pay Illyrian warriors with Greek arms, and helped the Molottian Alketas to win back part of his kingdom He was even charged with plotting with his Epeirot ally to plunder Delphoi This even Sparta would not endure, Dionysios had to content himself with sending a fleet along the west coast of Italy, to carry off the wealth of the great temple of Agylla or Cære

In old Greece men now said that the Greek folk was hemmed in between the barbarian Artaxerxes on the one side and Dionysios, master and planter of barbarians, on the other These feelings found expression when Dionysios sent his embassy to the Olympic games of 384, and when Lysias bade Greece rise against both its oppressors Dionysios vented his wrath on those who were nearest to him, banishing many, among them his brother Leptines and his earliest friend Philistos, and putting many to death He was also once more stirred up to play the part of a Hellenic champion he made ready for yet another Punic war

In this war (383-382) Dionysios seems for once to have had his head turned by a first success His demand that Carthage should altogether withdraw from Sicily was met by a crushing defeat Then came a treaty by which Carthage kept Selinous and part of the land of Akragas The Halykos became the boundary Dionysios had also to pay 1000 talents, which caused him to be spoken of as becoming tributary to the barbarians In the last years of his reign we hear dimly of both Syracusan and Carthaginian operations in southern Italy He also gave help to Sparta against Thebes, sending Gaulish and Iberian mercenaries to take part in Greek warfare His last war with Carthage, which was going on at his death, was ended by a peace by which the Halykos remained the boundary

Dionysios II and Dion The tyranny of Dionysios fell, as usual, in the second generation, but it was kept up for ten years after his death by the energy of Philistos, now minister of his son Dionysios the Younger It fell with the coming back of the exile Dion in 357 The tyranny had lasted so long that it was less easy than at the overthrow of the elder tyrants to fall back on an earlier state of things It had been a time of frightful changes throughout Sicily, full of breaking up of old landmarks, of confusion of races, and of movements of inhabitants But it also saw the foundation of new cities Besides Tyndaris and Tauromenion, the foundation of Alaisa marks another step in Sikel progress towards Hellenism, while the Carthaginians founded their strong town and fortress of Lilybaion Among these changes the most marked is the settlement of Campanian mercenaries in Greek and Sikel towns Yet they too could be brought under Greek influences, they were distant kinsfolk of the Sikels, and they were the forerunners of Rome They mark one stage of migration from Italy into Sicily 392-337 B.C.

The reign of Dionysios was less brilliant in the way of art and literature than that of Hieron Yet Dionysios himself sought fame as a poet, and his success at Athens shows that his compositions did not deserve the full scorn of his enemies The dithyrambic poet Philoxenos, by birth of Kythera, won his fame in Sicily, and other authors of lost poems are mentioned in various Sikeliot cities One of the greatest losses in all Greek history is that of the writings of Philistos (436-356), the Syracusan who had seen the Athenian siege and who died in the warfare between Dion and the younger Dionysios Through the time of both tyrants, he was, next to the actual rulers, the first man in Sicily, but of his record of his own times we have only what filters through the recasting of Diodoros But the most remarkable intellectual movement in Sicily at this time was the influence of the Pythagorean philosophy, which still lived on in southern Italy It led, through Dion, to the several visits of Plato to Sicily under both the elder and the younger Dionysios To architecture the time was not favourable anywhere but in Syracuse

The time following the Dionysian tyranny was at Syracuse a time full of the most stirring local and personal interest, under her two deliverers Dion and Timoleon It is less easy to make out the exact effect on the rest of Sicily of the three years' career of Dion But we may mark that, in driving out the younger Dionysios, he was helped by a general movement of Greeks, Sikels, and Sikans Between the death of Dion in 354 and the coming of Timoleon in 344 we hear of a time of confusion in which Hellenic life seemed likely to die out The cities, Greek and Sikel, were occupied by tyrants Syracuse was parted between several, Dionysios coming back to hold Ortygia Timoleon's work was threefold—the immediate deliverance of Syracuse, the restoration of Sicily in general to freedom and Greek life, and the defence of the Greek cities against Carthage The victory of the Krimisos in 340 led to a peace with Carthage with the old frontier, but all Greek cities were to be free, and Carthage was to give no help to any tyrant Timoleon drove out all the tyrants, and it specially marks the fusion of the two races that the people of the Sikel Agyrion were admitted to the citizenship of free Syracuse From some towns he drove out the Campanians, and he largely invited Greek settlement, especially from the Italiot towns, which were hard pressed by the Bruttians The Corinthian deliverer gave, not only Syracuse, but all Greek Sicily, a new lease of life, though a short one Timoleon

With Timoleon begins a series of leaders who came from old Greece to deliver or to conquer among the Greeks of Italy and Sicily The enterprise of Dion most likely suggested those that followed, but Dion, as a native Syracusan, does not belong altogether to the same class Timoleon alone was a pure republican deliverer The Macedonian kings had established a Greek dominion in the East, and a series of princes from Sparta and Epeiros came to establish in the West a Greek dominion which should balance that of the Macedonians Archidamos, Alexander of

337-276 B C Epeiros, Akrotatos, Kleonymos, all unsuccessfully attempted this work in Italy, it was only Pyrrhos, the last and greatest of the series, who played any great part in Sicily And before he came, Sicily had become the seat of a greater native power than ever Never till the Norman came was any Sicilian dominion so famous in the world as that of the Syracusan tyrant or king Agathokles

We have unluckily no intelligible account of Sicily during the twenty years after the death of Timoleon (337-317) His deliverance is said to have been followed by great immediate prosperity, but wars and dissensions very soon began again

Agathokles

Agathokles won his first fame in war between Syracuse and Akragas The Carthaginians played off one city and party against another, and Agathokles, following the same policy, became in 317, by treachery and massacre, undisputed tyrant of Syracuse, and spread his dominion over many other cities Akragas, strengthened by Syracusan exiles, now stands out again as the rival of Syracuse The Carthaginian Hamilkar, by conduct which contrasted with the cruelty of Agathokles, won many Greek cities to the Punic alliance Defeated in battle, with Syracuse blockaded by a Carthaginian fleet, Agathokles formed the bold idea of carrying the war into Africa He set the model for Regulus and Scipio, and not a few later rulers of Sicily

For more than three years (310 307) each side carried on warfare in the land of the other Carthage was hard pressed by Agathokles, while Syracuse was no less hard pressed by Hamilkar The force with which Agathokles invaded Africa was far from being wholly Greek, but it was representatively European Gauls, Samnites, Tyrrhenians, fought for him, while mercenary Greeks and Syracusan exiles fought for Carthage He won many battles and towns, he quelled mutinies of his own troops, by inviting and murdering Ophellas lord of Kyrene (Cyrene) he doubled his army and brought Carthage near to despair Meanwhile Syracuse, all but lost, had driven back Hamilkar, and had taken and slain him when he came again with the help of the Syracusan exile Deinokrates Meanwhile Akragas, deeming Agathokles and the barbarians alike weakened, proclaimed freedom for the Sicilian cities under her own headship Many towns, both Greek and Sikel, joined the confederacy It has now become impossible to distinguish the two races, Henna and Erbessos are now the fellows of Kamarina and Leontinoi But the hopes of Akragas were checked when Agathokles suddenly came back from Africa, landed at Selinous, and marched to Syracuse, taking one town after another A new scheme of Sicilian union was taken up by Deinokrates, which cut short his dominion But he now relieved Syracuse from the Carthaginian blockade, his mercenaries gained a victory over Akragas, and he sailed again for Africa, where fortune had turned against his son Archagathos, as it now did against himself He left his sons and his army to death, bondage, or Carthaginian service, and came back to Sicily almost alone Yet he could still gather a force which enabled him to seize Segesta, to slay or enslave the whole population, and to settle the city with new inhabitants This change amounts to the extinction of one of the elements in the old population of Sicily We hear no more of Elymoi, indeed Segesta has been practically Greek long before this Deinokrates and Agathokles came to a kind of partnership, and a peace with Carthage, with the old boundary, secured Agathokles in the possession of Syracuse and eastern Sicily (301)

At some stage of his African campaigns Agathokles had taken the title of king Earlier tyrants were well pleased to be spoken of as kings, but no earlier rulers of Sicily put either their heads or their names on the coin Agathokles now put his name, first without, and then with, the kingly title This was in imitation of the Macedonian leaders who divided the dominion of Alexander The relations between the eastern and western Greek worlds are drawing closer Agathokles in his old age took a wife of the house of Ptolemy, he gave his daughter Lanassa to Pyrrhos, and established his power east of Hadria, as the first Sicilian ruler of Korkyra He carried on wars in the Liparæan Islands and in southern Italy, and died in 289 B C, poisoned, some said, by his own grandson Alike more daring and more cruel than any ruler before him, he carried the arms of Sicily further afield, and made the island the seat of a greater power than any of them

This time was not favourable to the intellectual life of Sicily Hitherto the island had attracted men of letters from old Greece Now several distinguished Sicilian writers either chose or were driven to find homes elsewhere Timaios of Tauromenion, scorned by Polybios, but whose great Sicilian history is none the less a loss, was banished by Agathokles, and made Athens his headquarters for the last fifty years of his long life (356-*c* 260 B C) Dikaiarchos (Dicæarchus) of Messana, geographer and philosopher and author of the *Life of Greece*, lived mainly in Peloponnesos till about 285 B C Euhemeros (Evemerus), despiser of the gods, who is claimed by more than one birthplace besides Messana, lived in the service and friendship of the Macedonian Kassandros Philemon too, the long-lived writer of comedy (361-262 B C), is claimed for Syracuse, and it was only as an adopted citizen that he spent most of his life at Athens

Period after Agathokles

On the death of Agathokles tyrants sprang up in various cities Akragas, under its king Phintias, won back for the moment somewhat of its old greatness By a new depopulation of Gela, he founded the youngest of Sikeliot cities, Phintias, by the mouth of the southern Himera And Hellas was cut short by the seizure of Messana by the disbanded Campanian mercenaries of Agathokles (*c* 282) They slew the men, took the women as wives, and proclaimed themselves a new people in a new city by the name of Mamertines, children of Mamers or Mars Messana became an Italian town, henceforth its formal name was "Mamertina civitas"

The Campanian occupation of Messana is the first of the chain of events which led to the Roman dominion in Sicily As yet Rome has hardly been mentioned in Sicilian story, either for friendship or for enmity The Mamertine settlement, the war with Pyrrhos, bring us on quickly

Pyrrhos

Pyrrhos came as the champion of the western Greeks against all barbarians, whether Romans in Italy or Carthaginians in Sicily His Sicilian war (278-276) was a mere interlude between the two acts of his war with Rome As son-in-law of Agathokles, he claimed to be specially king of Sicily, and he held the Sicilian conquest of Korkyra as the dowry of Lanassa With such a deliverer, deliverance meant submission Pyrrhos is said to have dreamed of kingdoms of Sicily and of Italy for his two sons, the grandsons of Agathokles, and he himself reigned for two years in Sicily as a king who came to be no less hated than the tyrants Still as Hellenic champion in Sicily he has no peer As European champion he has none till Roger of Hauteville Eryx was won from the Phœnician, Panormos first became a city of Europe, if he failed before Lilybaion, that fortress and Messana were all that was left in barbarian hands through the whole island

All this was but for a moment The Greek king, on his way back to fight for Tarentum against Rome, had to cut his way through Carthaginians and Mamertines in Roman alliance His saying that he left Sicily as a wrestling-ground for Romans and Carthaginians was the very truth of the matter Very soon came the first war

between Rome and Carthage the war which is best marked by its other name of the War for Sicily. It mattered much, now that Sicily was to have a barbarian master, whether that master should be the kindred barbarian of Europe or the barbarian of Asia transplanted to the shore of Africa. That question was decided for Europe, that is for Rome, now beginning her long career as European champion. That strife too gave a large part of Sicily a last day of prosperity under a native ruler who was a king and not a tyrant.

Hieron II

Sicily in truth never had a more hopeful champion than the second Hieron of Syracuse. The established rule of Carthage in western Sicily was now something that could well be endured alongside of the robber commonwealth at Messana. The dominion of the freebooters was spreading. Besides the whole north-eastern corner of the island, it reached inland to Agyrion and Kentoripa. The Mamertines leagued with other Campanian freebooters who had forsaken the service of Rome to establish themselves at Rhegion. But a new Syracusan power was growing up to meet them. Hieron, claiming descent from Gelon, pressed the Mamertines hard. He all but drove them to the surrender of Messana; he even helped Rome to chastise her own rebels at Rhegion. The wrestling-ground was thus opened for the two barbarian commonwealths. Carthaginian troops held the Messanian citadel against Hieron, while another party in Messana craved the help of the head of Italy. Rome, chastiser of the freebooters of Rhegion, saw Italian brethren in the freebooters of Messana. The War for Sicily began (264).

The exploits of Hieron had already won him the kingly title (270) at Syracuse, and he was the representative of Hellenic life and independence throughout the island. Partly in this character, partly as direct sovereign, he was virtual ruler of a large part of eastern Sicily. But he could not aspire to the dominion of earlier Syracusan rulers. The advance of Rome after the retreat of Pyrrhos kept the new king from all hope of their Italian position. And presently the new kingdom exchanged independence for safety. When Rome entered Sicily as the ally of the Mamertines, Hieron became the ally of Carthage. But in the second year of the war (263) he found it needful to change sides. His alliance with Rome marks a great epoch in the history of the Greek nation. The kingdom of Hieron was the firstfruits out of Italy of the system by which alliance with Rome grew into subjection to Rome. He was the first of Rome's kingly vassals. His only burthen was to give help to the Roman side in war; within his kingdom he was free, and his dominions flourished as no part of Sicily had flourished since the days of Timoleon.

First Punic War

During the twenty-three years of the First Punic War (264-241) the rest of the island suffered greatly. The War for Sicily was fought in and round Sicily, and the Sicilian cities were taken and retaken by the contending powers. Akragas, held by Carthage, stood a Roman siege (262); the Punic garrison escaped, the inhabitants were sold into slavery. Seven years later the repeopled city was taken and burned and its walls destroyed by a Carthaginian army. Selinous was utterly destroyed, when, towards the end of the war, Carthage gathered her whole strength again in a few points in the west. Greek Selinous and Elymian Eryx alike gave way to the new fortress of Drepanon, which, along with Lilybaion, held out till the end of the war. Segesta, subject to Carthage, still remembered its old traditions, and the sons of Æneas were welcomed as deliverers by the Trojan city. Kamarina and inland Henna passed to and fro between the two powers. But the great exploit of Rome was the second winning of Panormos for Europe, and its brilliant defence against the Semitic enemy. The highest calling of the Greek had now, in the Western lands, passed to the Roman. By the treaty which ended the war Carthage ceded to Rome all her possessions in Sicily. As that part of the island which kept a national Greek government became the first kingdom dependent on Rome, so the share of Carthage became the first Roman province. One point alone did not come under either of those heads. Messana, *Mamertina civitas*, remained an Italian ally of Rome on Sicilian soil. 276-210 B.C.

We have no picture of Sicily in the first period of Roman rule. One hundred and seventy years later, several towns within the original province enjoyed various degrees of freedom, which they had doubtless kept from the beginning. Besides the old ally Messana, Panormos, Segesta, with Kentoripa, Halesa, and Halikye, once Sikel but now Hellenized, kept the position of free cities (*liberæ et immunes*, Cic., *Verr.*, iii. 6). The rest paid tithe to the Roman people as landlord. The province was ruled by a prætor sent yearly from Rome. Within the Roman province the new state of things called forth much discontent, but Hieron remained the faithful ally of Rome through a long life. On his death (215) and the accession of his grandson Hieronymos, his dynasty was swept away by the last revolution of Greek Syracuse. The result was revolt against Rome, the great siege by Marcellus, the taking of the city, the addition of Hieron's kingdom to the Roman province. Two towns only, which had taken the Roman side, Tauromenion and Netos, were admitted to the full privileges of Roman alliance (cf. Diod. Fr., Hoeschl., lib. xxiii. p. 18; Cic., *Verr.*, iii. 6, v. 22). Tauromenion indeed was more highly favoured than the children of Mamers. Rome had a right to demand ships of Messana, but not of Tauromenion. Some towns were destroyed; the people of Henna were massacred. Akragas, again held for Carthage, was for four years (214-210) the centre of an active campaign. The story of Akragas ended in plunder, slaughter, and slavery; three years later, the story of Agrigentum began.

The reign of Hieron was the last time of independent Greek culture in Sicily. His great works belong to the special history of Syracuse; but his time marks the growth of a new form of local Sicilian genius. The spread of Hellenic culture among the Sikels had in return made a Greek home for many Sikel beliefs, traditions, and customs. Bucolic poetry is the native growth of Sicily; in the hands of Theokritos it grew out of the germs supplied by Epicharmos and Sophron into a distinct and finished form of the art. The poet, himself of Syracuse, went to and fro between the courts of Hieron and Ptolemy Philadelphos; but his poetry is essentially Sicilian. So is that of his successors, both the Syracusan Moschos and Bion of Smyrna, who came to Sicily as to his natural school. The most renowned Sicilian name of this time, that of Archimedes, is hardly distinctively Sicilian. A great name in the history of science, a great name in the local history of Syracuse, he had not, like the earlier philosophers and the bucolic poets, any direct bearing on the general political or intellectual development of the island.

With the incorporation of the kingdom of Hieron into the Roman province independent Sicilian history comes to an end for many ages. Of the state of Sicily under the Roman commonwealth our chief source of knowledge is the pleading of Cicero against the worst Roman oppressor of Sicily, Gaius Verres. Next in importance to this come those fragments of Diodoros which describe the two insurrections of the slaves. Between those insurrections came the legislation of Rupilius which settled the Roman system of administration in Sicily. Cicero's description comes later than all these; but the general relations between Rome and Sicily seem to have been much the same from the first occupation till the beginning of the empire. In one part of the island Sicily Roman

210 B.C.-477 A.D. the Roman people stepped into the position of Carthage, in another part into that of King Hieron. The allied cities kept their several terms of alliance, the free cities kept their freedom; elsewhere the land paid to the Roman people, according to the law of Hieron, the tithe which it had paid to Hieron. But, as the tithe was let out to publicans, oppression was easy. The prætor, after the occupation of Syracuse, dwelled there in the palace of Hieron, as in the capital of the island. But, as a survival of the earlier state of things, one of his two quæstors was quartered at Lilybaion. Under the supreme dominion of Rome even the unprivileged cities kept their own laws, magistrates, and assemblies, provision being made for suits between Romans and Sicilians and between Sicilians of different cities (*Verr.*, ii. 16). In Latin the one name Siculi takes in all the inhabitants of the island; no distinction is drawn between Greek and Sikel, or even between Greek and Phœnician cities. It is assumed that all Siculi are Greeks (*Verr.*, ii. 3, 29, 49, 52, 65, iii. 37, 40, 73). Even in Greek, *Σικελοί* is now sometimes used instead of *Σικελιῶται*. All the persons spoken of by Cicero came to have Greek names save—a most speaking exception—Gaius Heius of *Mamertina civitas*. Inscriptions too from Sikel and Phœnician cities are commonly Greek, even when they commemorate men with Phœnician names, coupled perhaps with Greek surnames (*C. I. G.*, iii. 597, cf. 628). The process of Hellenization which had been so long going on had at last made Sicily thoroughly Greek. Roman conquest itself, which everywhere carried a Greek element with it, would help this result. The corn of the fertile island was said even then to feed the Roman people. It was this character of Sicily which led to its one frightful

Slave revolts. piece of local history. The evils of slavery and the slave-trade in their worst form—the slavery of men who are their masters' equals in all but luck—reached their height in the 2d century B.C. The wars of Rome, and the systematic piracy and kidnapping that followed them, filled the Mediterranean lands with slaves of all nations. Sicily stood out before the rest as the first land to be tilled by slave-gangs, on the estates both of rich natives and of Roman settlers. The free population naturally degenerated and died out. The slaves were most harshly treated, and even encouraged by their masters to rob. The land was full of disorder, and the prætors shrank from enforcing the law against offenders, many of whom, as Roman knights, might be their own judges. Of these causes came the two great slave-revolts of the second half of the 2d century B.C. They did not stand alone in the world, but no others reached the same extent. The first outbreak was stained by some excesses, but after that we are struck with the orderly course of the rebellion. It is regular warfare. Sicily had neither native militia nor Roman army; the slaves therefore, strengthened by the poorer freemen, occupied the whole land save only the great cities; they chose kings and founded them a capital. The chosen king of one district submits to the other for the general good. They form armies which could defeat Roman generals, and they are subdued only by efforts on the same scale as the conquest of a kingdom. For most of the slaves were men used to freedom and to arms, not a few of them Sicilian pirates. The fact that in the first war a slave named Achaios—like Davus, Geta, or Syrus—plays a chief part also tells us a good deal. The Syrian element was large, and the movement was mixed up with much of Syrian religion. But the native deities of Sicily and the holy place of the Palikoi were not forgotten. The first slave war lasted from 135 to 132, the time of Tiberius Gracchus and the fall of Numantia. The second lasted from 102 to 99, the time of the Cimbrian invasion. At other times the power of Rome might have quelled the revolt more speedily.

The slave wars were not the only scourge that fell on Sicily. The pirates troubled the coast, and all other evils were outdone by the three years' government of Verres (73-70 B.C.). Besides the light which the great impeachment throws on the state of the island, his administration seems really to have dealt a lasting blow to its prosperity. The slave wars had not directly touched the great cities; Verres plundered and impoverished everywhere. Another blow was the occupation of Messana by Sextus Pompeius in 42 B.C. He was master of Sicily for six years, and Strabo (vi. 2, 4) attributes to this war the decayed state of several cities. To undo this mischief Augustus planted Roman colonies at Syracuse, Tauromenion, Thermæ, Tyndaris, and Katana. The island thus received another Italian infusion; but, as elsewhere, Latin in no way displaced Greek; it was simply set up alongside of it for certain purposes. Roman tastes now came in; Roman buildings, especially amphitheatres, arose. But Sicily never became Roman like Gaul and Spain. The dictator Cæsar designed the Roman, and Marcus Antonius the Latin, franchise for all Sicily; but neither plan was carried out. Sicily remained a province, a province of the senate and people, not of the prince. Particular cities were promoted to higher privileges, and that was all. The Mamertines were Romans in Pliny's day; two free cities, Kentoripa and Segesta, had become Latin; still later, Phœnician Lilybaion received a Roman colony. All these were steps in the progress by which, in Sicily as elsewhere, political distinctions were broken down, till the edict of Antoninus bestowed at least the Roman name—no small gift—on all Roman allies and subjects. Sicily was now part of *Romania*, but it was one of its Greek members. Later Roman rule in Sicily.

Till this change was made, Sicily could not be in any sense incorporated with Italy. In the division of Constantine, when the word *province* had lost its meaning, when Italy itself was mapped out into provinces, Sicily became one of these last. Along with Africa, Rætia (Rhætia), and western Illyricum, it became part of the Italian præfecture; along with the islands of Sardinia and Corsica, it became part of the Italian diocese. It was now ruled by a corrector (see the letter of Constantine, which stands first in the *Codex Diplomaticus Siciliæ* of Johannes), afterwards by a consular under the authority of the vicar of the Roman city (*Not. Imp.*, 14, 5). Few emperors visited Sicily; Hadrian was there, as everywhere, and Julian also (*C. D.*, 10). In its provincial state Sicily fell back more than some other provinces. Ausonius could still reckon Catina and fourfold Syracuse ("quadruplices Syracusas") among noble cities; but Sicily is not, like Gaul, rich in relics of later Roman life, and it is now Egypt rather than Sicily that feeds Rome. The island has no internal history beyond a very characteristic fact, a third slave war in the days of Gallienus. External history there could be none in the central island, with no frontier open to Germans or Persians. Sicilian history begins again when the wandering of the nations planted new powers, not on the frontier of the empire, but at its heart.

The powers between which Sicily now passes to and fro are Teutonic powers. The earlier stages of Teutonic advance could not touch Sicily. Alaric thought of a Sicilian expedition, but a storm hindered him. Sicily was to be reached only by a Teutonic power which made its way through Gaul, Spain, and Africa. The Vandal now dwells at Carthage instead of the Canaanite. Gaiseric (429-477) subdued the great islands for which Roman and Phœnician had striven. Along with Sardinia, Corsica, and the Balearic Isles, Sicily is again a possession of a naval power at Carthage. Gaiseric, at Rome more than a Hannibal, makes a treaty with Odowakar (Odoacer) almost like that which ended the First Punic War. He gave up (Victor Teutonic masters.

Vitensis, i 4) the island on condition of a tribute, which was hardly paid by Theodoric Sicily was now ruled by a Gothic count, and the Goths claimed to have treated the land with special tenderness (Procopius, *Bell Goth*, iii 16) The island, like the rest of Theodoric's dominions, was certainly well looked after by the great king and his minister, yet we hear darkly of disaffection to Gothic rule (Cass, *Var*, i 3) Theodoric gave back Lilybaion to the Vandal king Thrasamund as the dowry of his sister Analafrida (Proc, *Bell Vand*, i 8) Yet Lilybaion was a Gothic possession when Belisarius, conqueror of Africa, demanded it in vain as part of the Vandal possessions (Proc, *Bell Vand*, ii 5, *Bell Goth*, i 3) In the Gothic war Sicily was the first land to be recovered for the empire, and that with the good will of its people (535) Panormus alone was stoutly defended by its Gothic garrison In 550 Totila took some fortresses, but the great cities all withstood him, and the Goths were driven out the next year

Sicily under the Eastern empire

Sicily was thus won back to the Roman dominion, but the seat of the Roman dominion was now at Constantinople Belisarius was Pyrrhos and Marcellus in one For 430 years some part of Sicily, for 282 years the whole of it, again remained a Roman province To the Gothic count again succeeded, under Justinian, a Roman *prætor*, in Greek στρατηγός That was the official title, we often hear of a *patrician* of Sicily, but patrician was in strictness a personal rank In the later mapping out of the empire into purely military divisions, the *theme* (θέμα) of Sicily took in both the island and the nearest peninsula of the mainland, the oldest Italy The island itself was divided for financial purposes, almost as in the older times, into the two divisions of Syracuse and Lilybaion The revolutions of Italy hardly touched a land which looked steadily to the eastern Rome as its head The Lombard and Frankish masters of the peninsula never fixed themselves in the island When the Frank took the imperial crown of the West, Sicily still kept its allegiance to the Augustus who reigned at Constantinople, and was only torn away piecemeal from the empire by the next race of conquerors

Ecclesiastical relations with Italy

This connexion of Sicily with the eastern division of the empire no doubt largely helped to keep up Greek life in the island This was of course strengthened by union with a power which had already a Greek side, and where the Greek side soon became dominant Still the connexion with Italy was close, especially the ecclesiastical connexion Some things tend to make Sicily look less Greek than it really was The great source of our knowledge of Sicily in the century which followed the reconquest by Belisarius is the *Letters* of Pope Gregory the Great, and they naturally show the most Latin side of things The merely official use of Latin was, it must be remembered, common to Sicily with Constantinople Gregory's *Letters* are largely occupied with the affairs of the great Sicilian estates held by the Roman Church, as by the churches of Milan and Ravenna But they deal with many other matters (see the collection in Johannes, *C D*, where the letters bearing on Sicily are brought together, or the usual collection of his letters) Saint Paul's visit to Syracuse naturally gave rise to many legends, but the Christian Church undoubtedly took early root in Sicily We hear of Manichæans (*C D*, 163), Jews were plentiful, and Gregory causes compensation to be made for the unlawful destruction of synagogues Of paganism we find no trace, save that pagan slaves, doubtless not natives of the island, were held by Jews (*C D*, 127) Herein is a contrast between Sicily and Sardinia, where, according to a letter from Gregory to the empress Constantina, wife of Maurice (594-595), praying for a lightening of taxation in both islands, paganism still lingered (*C D*, 121) Sicily belonged to the Latin patriarchate, but we already (*C D*, 103) see glimmerings of the coming disputes between 477 829
the Eastern and Western Churches Things were changed when, in the early days of the iconoclast controversy, Leo the Isaurian confiscated the Sicilian and Calabrian estates of the Roman Church (Theoph, i 631)

In the 9th, 10th, and 11th centuries the old drama of Sicily was acted again The island is again disputed between Europe and Asia, transplanted to Africa between Greek and Semitic dwellers on her own soil Panormus and Syracuse are again the headquarters of races and creeds, of creeds yet more than of races The older religious differences—not small certainly when the choice lay between Zeus and Moloch—were small compared with the strife for life and death between Christendom and Islam Gregory and Mahomet were contemporaries, and, though Saracen occupation did not begin in Sicily till more than two centuries after Gregory's death, Saracen inroads began much sooner In 655 (Theoph, i 532) part of Sicily was plundered, and its inhabitants carried to Damascus Then came the strange episode of the visit of Constans the Second (641-668), the first emperor, it would seem, who had set foot in Sicily since Julian After a war with the Lombards, after twelve days' plunder of Rome, he came on to Syracuse, where his oppressions led to his murder in 668 Sicily now saw for the first time the setting up of a tyrant in the later sense Meketios, commander of the Eastern army of Constans, revolted, but Sicily and Roman Italy kept their allegiance to the new emperor Constantine Pogonatos, who came in person to destroy him Then came another Saracen inroad from Alexandria, in which Syracuse was sacked (Paul Diac, v 13) Others followed, but there was as yet no lasting settlement Towards the end of the 8th century, though Sicily itself was untouched, its patricians and their forces play a part in the affairs of southern Italy as enemies of the Frankish power Charles himself was believed (Theoph, i 736) to have designs on Sicily, but, when it came to Saracen invasion, the sympathies of both pope and Cæsar lay with the invaded Christian land (*Mon Car*, 323, 328)

Early Saracen inroads

Saracen conquest

In 813 a peace for ten years was made between the Saracens and the patrician Gregory A few years after it expired Saracen settlement in the island begins This was a special time of Saracen inroad on the islands belonging to the Eastern empire Almost at the same moment Crete was seized by a band of adventurers from Spain But the first Saracen settlers in Sicily were the African neighbours of Sicily, and they were called to the work by a home treason The story has been tricked out with many romantic details (*Chron Salern*, 60, ap Pertz, iii 498, Theoph Cont, ii 272, George Kedrenos, ii 97), but it seems plain that Euphemios or Euthymios of Syracuse, supported by his own citizens, revolted against Michael the Stammerer (820-829), and, when defeated by an imperial army, asked help of Ziyâdet Allah, the Aghlabite prince of Kairawân, and offered to hold the island of him The struggle of 138 years now began Euphemios, a puppet emperor, was led about by his Saracen allies much as earlier puppet emperors had been led about by Alaric and Ataulf, till he was slain in one of the many sieges The second Semitic conquest of Sicily began in 827 at Mazzara on the old border of Greek and Phœnician But the land had a brave defender in the patrician Theodotos, and the invaders met with a stout resistance both in the island and from armies both from Constantinople and from Byzantine Italy The advance of the invaders was slow In two years all that was done was to occupy Mazzara and Mineum —the old Menai of Douketios—strange points certainly to begin with, and seemingly to destroy Agrigentum, well used to destruction Attacks on Syracuse failed, so did

829–1060 attacks on Henna—*Castrum Ennæ*, now changing into *Castrum Johannis* (perhaps Καστροιάννη), Castrogiovanni. The actual gain was small, but the invaders took seizin alike of the coast and of the island.

A far greater conquest followed when new invaders came from Spain and when Theodotos was killed in 830. The next year Panormus passed away for ever from Roman, for 230 years from Christian, rule. Syracuse was for fifty years, not only, as of old, the bulwark of Europe, but the bulwark of Christendom. By the conquest of Panormus the Saracens were firmly rooted in the island. We hear dimly of treasonable dealings with them on the part of the *strategos* Alexios, son-in-law of the emperor Theophilos; but we see more clearly that Saracen advance was largely hindered by dissensions between the African and the Spanish settlers. In the end the Moslem conquests in Sicily became an Aghlabite principality owning at best a formal superiority in the princes of Kairawan. With the Saracen occupation begins a new division of the island, which becomes convenient in tracing the progress of Saracen conquest. This is into three valleys, known in later forms of language as Val di Mazzara or Mazza in the north-west, Val di Noto in the south-east, and Val Demone (a name of uncertain origin) in the north-east (see Amari, *Musulmani in Sicilia*, i. 465). The first Saracen settlement of Val di Mazzara answers roughly to the old Carthaginian possessions. From Panormus the emir or lord of Sicily, Mohammed ibn Abdallah, sent forth his plunderers throughout Sicily and even into southern Italy. There, though they made no lasting settlements, they often occupied particular points. A consul or duke of Naples in 836 even asked for Saracen help against the Lombards, which he is said to have repaid by help against his fellow-subjects in Sicily (Johan. Diac., 57; Amari, i. 314).

The chief work of the next ten years was the conquest of the Val di Noto, but the first great advance was made elsewhere. In 843 the Saracens won the Mamertine city, Messana, and thus stood in the path between Italy and Sicily. Then the work of conquest, as described by the Arabic writers, went on, but slowly. At last, in 859, the very centre of the island, the stronghold of Henna, was taken, and the main part of Val di Noto followed. But the divisions among the Moslems helped the Christians; they won back several towns, and beat off all attacks on Syracuse and Tauromenium. It is strange that the reign of Basil the Macedonian (867), a time of such renewed vigour in the empire, was the time of the greatest of all losses in Sicily. In Italy the imperial frontier largely advanced; in Sicily imperial fleets threatened Panormus. But in 875 the accession of Ibráhím ibn Ahmed in Africa changed the face of things. The emir in Sicily, Ja'far ibn Ahmed, received strict orders to act vigorously against the eastern towns. In 877 began the only successful Semitic siege of Syracuse. The next year the city, which for 1600 years had been the seat of Greek, Roman, and Christian life, passed for the first time under the yoke of strangers to the fellowship of Europe.

Thus in fifty-one years the imperial and Christian territory in Sicily was cut down to a few points on or near the eastern coast, to the Val Demone in short without Messana. But between Moslem dissension and Christian valour the struggle had still to be waged for eighty-seven years. Henna had been the chief centre of Christian resistance a generation earlier; its place was now taken by the small fort of Rametta not far from Messina. The Moslems of Sicily were busy in civil wars; Arabs fought against Berbers, both against the African overlord. In 900 Panormus had to be won by a son of Ibráhím from Moslem rebels provoked by his father's cruelty. But when Ibráhím himself came into Sicily, renewed efforts against the Christians led to the first taking of Tauromenium (908), of Rametta, and of other points. The civil war that followed his death, the endless revolutions of Agrigentum, where the weaker side did not scruple to call in Christian help, hindered any real Saracen occupation of eastern Sicily. The emperors never gave up their claims to Sicily or their hopes of recovering it. Besides the struggle with the Christians in the island, there was often direct warfare between the empire and the Saracens; but such warfare was more active in Italy than in Sicily. In 956 a peace or truce was made by the emperor Constantine Porphyrogenitus. A few years later, Otho the Great, the restorer of the Western empire, looked to Sicily as a land to be won back for Christendom. It had not yet wholly passed away, but the day soon came. Strange to say, as Syracuse fell in the reign of Basil the Macedonian, the Saracen occupation was completed in the reign of Nikephoros Phokas (Nicephorus Phocas), the deliverer of Crete. In the very year of his accession (963) Tauromenium was taken for the second time, and became for a hundred years a Mohammedan possession. Rametta alone held out. A fleet and army from Constantinople went in vain to its help; the last stronghold of Christendom was taken (965), and for a season all was over.

Thus in 138 years the Arab did what the Canaanite had never done. The whole island was a Semitic, that is now a Mohammedan, possession. The Greek-speaking Roman of Sicily was a bondman in his own land, like the Latin-speaking Roman of Spain. Yet the complete Saracen possession of Sicily may seem a thing of a moment. Its first and longest period lasted only 73 years. In that time Mohammedan Sicily was threatened by a Western

Reconquest by Eastern empire.

emperor; the Arabic writers claim the Saracen army by which Otho the Second was beaten back in 982 as a Sicilian army. A mightier enemy was threatening in the East. Basil the Second planned the recovery of Sicily in good earnest. In 1027 he sent a great army; but his death stopped their progress before they reached the island. But the great conqueror had left behind him men trained in his school, and eleven years later the eagles of the new Rome again marched to Sicilian victories. The ravages of the Sicilian Saracens in the Greek islands were more frightful than ever, and George Maniakes, the first captain of his time, was sent to win back the lost land. He too was helped by Saracen dissensions. The emir Abul-afar became a Roman vassal, and, like Alaric of old, became *magister militum* in the Roman army. His brother and rival Abuhafas brought help from Africa, and finally all joined against the Christians. Four years of Christian victory (1038-1042) followed. In the host of Maniakes were men of all races,—Normans, who had already begun to show themselves in south Italy, and the Warangian guard, the best soldiers of the empire, among whom Harold Hardrada himself is said to have held a place. Town after town was delivered, first Messana, then Syracuse, then a crowd of others. The exact extent of the reconquest is uncertain; Byzantine writers claim the deliverance of the whole island; but it is certain that the Saracens never lost Panormus. But court influence spoiled everything. Maniakes was recalled; under his successor Stephen, brother-in-law of the emperor Michael, the Saracens won back what they had lost. Messana alone held out, for how long a time is uncertain. But it could not have been again under the yoke for many years when a conqueror came who had no empresses to thwart him. The second Saracen occupation of all Sicily was short indeed. In 1060 began the thirty years' work of the first Roger.

Sicily under Saracen rule.

Thus for 263 years the Christian people of some part or other of Sicily were in subjection to Moslem masters. But that subjection differed widely in different times and

places The land was won bit by bit One town was taken by storm, another submitted on terms harsher or more favourable The condition of the Christians varied from that of personal slaves to that of communities left free on the payment of tribute The great mass were in the intermediate state usual among the non-Mohammedan subjects of a Mohammedan power The *dhimmî* of Sicily were in essentially the same case as the *rayahs* of the Turk While the conquest was going on, the towns that remained unconquered gained in point of local freedom They became allies rather than subjects of the distant emperor So did the tributary districts, as long as the original terms were kept But, as ever, the condition of the subject race grew worse After the complete conquest of the island, while the mere slaves had turned Mohammedans, there is nothing more heard of tributary districts At the coming of the Normans the whole Christian population was in the state of *rayahs* Still Christianity and the Greek tongue never died out, churches and monasteries received and held property, there still are saints and men of learning Panormus was specially Saracen, yet a Christian religious guild could be founded there in 1048 (*Tabularium Regiæ Cap Panorm*, p 1) We have its Greek foundation deed It would be rash to deny that traces of other dialects may not have lingered on, but Greek and Arabic were the two written tongues of Sicily when the Normans came The Sicilian Saracens were hindered by their internal feuds from ever becoming a great power, but they stood high among Mohammedan nations Their advance in civilization is shown by their position under the Normans, and above all by their admirable style of architecture (see PALERMO) Saracens are always called in for any special work of building or engineering They had a literature which Norman kings studied and promoted The Normans in short came into the inheritance of the two most civilized nations of the time, and they allowed the two to flourish side by side

Norman conquest

The most brilliant time for Sicily as a power in the world begins with the coming of the Normans Never before or after was the island so united or so independent Some of the old tyrants had ruled out of Sicily, none had ruled over all Sicily The Normans held all Sicily as the centre of a dominion which stretched far beyond it The conquest was the work of one man, Count Roger of the house of Hauteville, brother of the more famous Robert Wiscard (Guiscard) That it took him thirty years was doubtless owing to his being often called off to help his brother in Italy and beyond Hadria The conquests of the Normans in Italy and Sicily form part of one enterprise, but they altogether differ in character In Italy they overthrew the Byzantine dominion, their own rule was perhaps not worse, but they were not deliverers In Sicily they were everywhere welcomed by the Christians as deliverers from infidel bondage

As in the Saracen conquest of Sicily, as in the Byzantine recovery, so in the Norman conquest, the immediate occasion was given by a home traitor Count Roger had already made a plundering attack, when Becumen of Catania, driven out by his brother, urged him to serious invasion Messina was taken in 1060, and became for a while the Norman capital The Christians everywhere welcomed the conqueror But at Traina they presently changed their minds, and joined with the Saracens to besiege the count in their citadel At Catania Becumen was set up again as Roger's vassal, and he did good service till he was killed Roger soon began to fix his eye on the Saracen capital Against that city he had Pisan help, as the inscription on the Pisan *duomo* witnesses (cf Geoff Mal, ii 34) But Palermo was not taken until 1071, and then only by the help of Duke Robert, who kept the prize to himself Still its capture was the turning-point in the struggle 1060-1090
Taormina (Tauromenium) was won in 1078 Syracuse, under its emir Benarvet, held out stoutly He won back Catania by the help of a Saracen to whom Roger had trusted the city, and whom he himself punished Catania was won back by the count's son Jordan But progress was delayed by Jordan's rebellion and by the absence of Roger in his brother's wars At last, in 1085, Syracuse was won Next year followed Girgenti and Castrogiovanni, whose chief became a Christian Noto, the Saracen Rametta, held out till 1090 Then the whole island was won, and Roger completed his conquest by a successful expedition to Malta

Saracens under Norman rule

Like the condition of the Greeks under the Saracens, so the condition of the Saracens under the Normans differed in different places according to the circumstances of each conquest The Mohammedan religion was everywhere tolerated, in many places much more But it would seem that, just as under the Moslem rule, conversions from Christianity to Islam were forbidden On the other hand, conversions from Islam to Christianity were not always encouraged, Saracen troops were employed from the beginning, and Count Roger seems to have thought them more trustworthy when unconverted At Palermo the capitulation secured to the Saracens the full enjoyment of their own laws, Girgenti was long mainly Saracen, in Val di Noto the Saracens kept towns and castles of their own On the other hand, at Messina there were few or none, and we hear of both Saracen and Greek villains, the latter doubtless abiding as they were in Saracen times But men of both races were trusted and favoured according to their deserts The ecclesiastical relations between Greeks and Latins are harder to trace At the taking of Palermo the Greek bishop was restored, but his successors were Latins, and Latin prelates were placed in the bishoprics which Count Roger founded Urban the Second visited Sicily to promote the union of the church, and he granted to the count those special ecclesiastical powers held by the counts and kings of Sicily as hereditary legates of the Holy See which grew into the famous Sicilian monarchy (Geoff Mal, iv 29) But Greek worship went on, at Messina it lingered till the 14th and 15th centuries (Pirro, *Sicilia Sacra*, i 420, 431, 449), as it has been since brought back by the Albanian colonists But the Greeks of Sicily have long been united Greeks, admitting the authority of the see of Rome

Linguistic elements in Sicily

In its results the Norman conquest of Sicily was a Latin conquest far more thorough than that which had been made by the Roman commonwealth The Norman princes protected all the races, creeds, and tongues of the island, Greek, Saracen, and Jew But new races came to settle alongside of them, all of whom were Latin as far as their official speech was concerned The Normans brought the French tongue with them, it remained the court speech during the 12th century, and Sicily was thrown open to all speakers of French, many of whom came from England There was constant intercourse between the two great islands, both ruled by Norman kings, and many natives of England filled high places in Sicily But French was only a language of society, not of business or literature The languages of inscriptions and documents are Greek, Arabic, and Latin, in private writings sometimes Hebrew The kings understood Greek and Arabic, and their deeds and works were commemorated in both tongues Hence comes the fact, at first sight so strange, that Greek, Arabic, and French have all given way to a dialect of Italian But the cause is not far to seek The Norman conquest opened Sicily to settlers from Italy, above all from the Norman possessions in Italy Under the name of Lombards, they became an important, in some parts a dominant, element

1090 1197 Thus at Messina, where we hear nothing of Saracens, we hear much of the disputes between Greeks and Lombards The Lombards had hardly a distinct language to bring with them At the time of the conquest, it was already found out that French had become a distinct speech from Latin, Italian hardly was such The Lombard element, during the Norman reign, shows itself, not in whole documents or inscriptions, but in occasional words and forms, as in some of the mosaics at Monreale And, if any element, Latin or akin to Latin, had lingered on through Byzantine and Saracen rule, it would of course be attracted to the new Latin element, and would help to strengthen it It was this Lombard element that had the future before it Greek and Arabic were antiquated, or at least isolated, in a land which Norman conquest had made part of Western Europe and Latin Christendom They could grow only within the island, they could gain no strength from outside Even the French element was in some sort isolated, and later events made it more so But the Lombard element was constantly strengthened by settlement from outside In the older Latin conquest, the Latin carried Greek with him, and the Greek element absorbed the Latin Latin now held in western Europe the place which Greek had held there Thus, in the face of Italian, both Greek and Arabic died out Step by step, Christian Sicily became Latin in speech and in worship But this was not till the Norman reigns were over Till the end of the 12th century Sicily was the one land where men of divers creeds and tongues could live side by side, each in his own way

Hence came both the short-lived brilliancy of Sicily and its later decay In Sicily there were many nations all protected by the Sicilian king, but there was no Sicilian nation Greek, Saracen, Norman, Lombard, and Jew could not be fused into one people, it was the boast of Sicily that each kept his laws and tongue undisturbed Such a state of things could live on only under an enlightened despotism, the discordant elements could not join to work out really free and national institutions Sicily had parliaments, and some constitutional principles were well understood But they were assemblies of barons, or at most of barons and citizens, they could only have represented the Latin elements, Norman and Lombard, in the island The elder races Greek and Saracen, stand outside the relations between the Latin king and his Latin subjects Still, as long as Greek and Saracen were protected and favoured, so long was Sicily the most brilliant of European kingdoms But its greatness had no groundwork of national life, for lack of it the most brilliant of kingdoms presently sank below the level of other lands

Four generations only span the time from the birth of Count Roger, about 1030, to the death of the emperor Frederick the Second in 1250 Roger, great count of Sicily, was, at his death in 1101, succeeded by his young son Simon,
Roger I and he in 1105 by the second Roger, the first king He inherited all Sicily, save half Palermo—the other half had been given up—and part of Calabria The rest of Palermo was soon granted, the Semitic capital became the abiding head of Sicily On the death of Duke William of Apulia, Roger gradually founded (1127-40) a great Italian dominion To the Apulian duchy he added (1136) the Norman principality of Capua, Naples (1138), the last dependency of the Eastern empire in Italy, and (1140) the Abruzzi, an undoubted land of the Western empire He thus formed a dominion which has been divided, united, and handed over from one prince to another, oftener than any other state in Europe, but whose frontier has hardly changed at all In 1130 Roger was crowned at Palermo, by authority of the antipope Anacletus, taking the strange title of "king of Sicily and Italy" This, on his reconciliation with Pope Innocent the Second, he exchanged for "king of Sicily and of the duchy of Apulia and of the principality of Capua" By virtue of the old relations between the popes and the Normans of Apulia, he held his kingdom in fief of the Holy See, a position which on the whole strengthened the royal power But his power, like that of Dionysios and Agathokles, was felt in more distant regions His admiral George of Antioch, Greek by birth and creed, warred against the Eastern empire, won Corfu (Korypho, the name of Korkyra is forgotten) for a season, and carried off the silk-workers from Thebes and Peloponnesos to Sicily But Manuel Komnenos (Comnenus) ruled in the East, and, if Roger threatened Constantinople, Manuel threatened Sicily In Africa the work of Agathokles was more than renewed, Mahadia and other points were won and kept as long as Roger lived These exploits won him the name of the terror of Greeks and Saracens To the Greeks, and still more to the Saracens, of his own island he was a protector and something more

Roger's son William, surnamed the Bad, was crowned William
in his father's lifetime in 1151 Roger died in 1154, and I and II
William's sole reign lasted till 1166 It was a time of domestic rebellions, chiefly against the king's unpopular ministers, and it is further marked by the loss of Roger's African conquests After William the Bad came (1166 1189) his son William the Good Unlike as were the two men in themselves, in their foreign policy they are hardly to be distinguished The Bad William has a short quarrel with the pope, otherwise Bad and Good alike appear as zealous supporters of Alexander the Third, and as enemies of both empires The Eastern warfare of the Good is stained by the frightful sack of Thessalonica, it is marked also by the formation of an Eastern state under Sicilian supremacy (1186) Corfu, the possession of Agathokles and Roger, with Durazzo, Cephalonia, and Zante, was granted by William to his admiral Margarito with the strange title of king of the Epeirots He founded a dynasty, though not of kings, in Cephalonia and Zante Corfu and Durazzo were to be more closely connected with the Sicilian crown

The brightest days of Sicily ended with William the Good His marriage with Joanna, daughter of Henry of Anjou and England, was childless, and William tried to procure the succession of his aunt Constance and her husband, King Henry the Sixth of Germany, son of the emperor Frederick the First But the prospect of German rule was unpopular, and on William's death the crown passed to Tancred, an illegitimate grandson of King Roger, Tancred
who figures in English histories in the story of Richard's crusade In 1191 Henry, now emperor, asserted his claims, but, while Tancred lived, he did little, in Sicily nothing, to enforce them On the death of Tancred (1194) and the accession of his young son William the Third, the William
emperor came and conquered Sicily and the Italian posses- III
sions, with an amount of cruelty which outdid any earlier war or revolution First of four Western emperors who wore the Sicilian crown, Henry died in 1197, leaving the kingdom to his young son Frederick, heir of the Norman kings through his mother

The great days of the Norman conquest and the Norman reigns have been worthily recorded by contemporary historians For few times have we richer materials The oldest is Aimé or Amato of Monte Cassino, who exists only in an Old-French translation We have also for the Norman conquest the halting hexameters of William of Apulia, and for the German conquest the lively and partial verses of Peter of Eboli Of prose writers we have Geoffrey Malaterra, Alexander abbot of Telesia, Romuald archbishop of Salerno, Falco of Benevento, above all Hugo Falcandus, one of the very foremost of mediæval writers

Not one of these Latin writers was a native of the island, and we have no record from any native Greek. Occasional notices we of course have in the Byzantine writers, and Archbishop Eustathios's account of the taking of Thessalonica is more than occasional. And the close connexion between Sicily and England leads to many occasional references to Sicilian matters in English writers.

The relations between the various races of the islands are most instructive. The strong rule of Roger kept all in order. He called himself the defender of Christians; others, on account of his favour to the Saracens, spoke of him as a pagan. He certainly encouraged Saracen art and literature in every shape. His court was full of eunuchs, of whom we hear still more under William the Bad. Under William the Good the Saracens, without any actual oppression, seem to be losing their position. Hitherto they had been one element in the land, keeping their own civilization alongside of others. By a general outbreak on the death of William the Good, the Saracens, especially those of Palermo, were driven to take shelter in the mountains, where they sank into a wild people, sometimes holding points of the island against all rulers, sometimes taking military service under them. The Jews too begin to sink into bondmen. Sicily is ceasing to be the land of many nations living side by side on equal terms.

Emperor Frederick II. The Germans who helped Henry to win the Sicilian crown did not become a new element in the island, but only a source of confusion during the minority of his son Frederick—presently to be the renowned emperor Frederick the Second, "Fridericus stupor mundi et immutator mirabilis"—was crowned at Palermo in 1198; but the child, deprived of both parents, was held to be under the protection of his lord Pope Innocent the Third. During his minority the land was torn in pieces by turbulent nobles, revolted Saracens, German captains seeking settlements, the maritime cities of Italy, and professed French deliverers. In 1210 the emperor Otho the Fourth, who had overrun the continental dominions, threatened the island. In 1212, just when Frederick was reaching an age to be of use in his own kingdom, he was called away to dispute the crown of Germany and Rome with Otho. Eight years more of disorder followed; in 1220 the emperor-king came back. He brought the Saracens of the mountains back again to a life in plains and cities, and presently planted a colony of them on the mainland at Nocera, when they became his most trusty soldiers. His necessary absences from Sicily led to revolts. He came back in 1233 from his crusade to suppress a revolt of the eastern cities, which seem, like those of Italy, to have been aiming at republican independence. A Saracen revolt in 1243 is said to have been followed by a removal of the whole remnant to Nocera. Some however certainly stayed or came back; but their day was over.

Under Frederick the Italian or Lombard element finally prevailed in Sicily. Of all his kingdoms Sicily was the best-beloved. He spoke all its tongues; he protected, as far as circumstances would allow, all its races. He legislated for all in the spirit of an enlightened and equal despotism, jealous of all special privileges, whether of nobles, churches, or cities. The heretic alone was persecuted; he was the domestic rebel of the church; Saracen and Jew were entitled to the rights of foreigners. Yet Frederick, patron of Arabic learning, suspected even of Moslem belief, fails to check the decline of the Saracen element in Sicily. The Greek element has no such forces brought against it. It is still a chief tongue of the island, in which Frederick's laws are put forth as well as in Latin. But it is clearly a declining element. Greek and Saracen were both becoming survivals in an island which was but one of the many kingdoms of its king. No wonder that the Italian element advanced at the cost of all others. Frederick chose it as 1197-1282 the court speech of Sicily, and he made it more than a court speech, the speech of a new-born literature. Sicily, strangely enough, became the cradle of Italian song.

Two emperors had now held the Sicilian crown. On Frederick's death in 1250 the crown passed to his son Conrad, not emperor indeed, but king of the Romans. He was nominally succeeded by his son Conradin. The real ruler under both was Frederick's natural son Manfred. Manfred In 1258, on a false rumour of the death of Conradin, Manfred was himself crowned king at Palermo. He had to found the kingdom afresh. Pope Innocent the Fourth had crossed into Sicily, to take advantage of the general discontent. The cities, whose growing liberties had been checked by Frederick's legislation, strove for practical, if not formal, independence, sometimes for dominion over their fellows. The 5th century B.C. seemed to have come back. Messina laid waste the lands of Taormina, because Taormina would not obey the bidding of Messina. Yet, among these and other elements of confusion, Manfred succeeded in setting up again the kingly power, first for his kinsmen and then for himself. His reign continued that of his father, so far as a mere king could continue the reign of such an emperor. The king of Sicily was the first potentate of Italy, and came nearer than any prince since Louis the Second to the union of Italy under Italian rule. He sought dominion too beyond Hadria. Corfu, Durazzo, and a strip of the Albanian coast became Sicilian possessions as the dowry of Manfred's Greek wife. But papal enmity was too much for him. His overlord claimed to dispose of his crown, and hawked it about among the princes of the West. Edmund of England bore the Sicilian title for a moment. More came of the grant of Urban the Fourth (1264) to Charles, count of Anjou, and through his wife sovereign count of Provence. Charles, crowned Charles of Anjou by the pope in 1266, marched to take possession of his lord's grant. Manfred was defeated and slain at Benevento. The whole Sicilian kingdom became the spoil of a stranger who was no deliverer to any class of its people. The island sank yet lower. Naples, not Palermo, was the head of the new power; Sicily was again a province. But a province Sicily had no mind to be. In the continental lands Charles founded a dynasty; the island he lost after sixteen years. His rule was not merely the rule of a stranger king surrounded by stranger followers; the degradation of the island was aggravated by gross oppression, grosser than in the continental lands. The continental lands submitted, with a few slight efforts at resistance. The final result of the Angevin conquest of Sicily was its separation from the mainland.

Sicilian feeling was first shown in the support given to the luckless expedition of Conradin in 1268. Frightful executions in the island followed his fall. The rights of the Swabian house were now held to pass to Peter (Pedro), king of Aragon, husband of Manfred's daughter Constance. The connexion with Spain, which has so deeply affected the whole later history of Sicily, now begins. Charles held the Greek possessions of Manfred and had designs both on Epeiros and on Constantinople. The emperor Michael Palaiologos and Peter of Aragon became allies against Charles; the famous John of Procida acted as an agent between them; the costs of Charles's Eastern warfare caused great discontent, especially in an island where some might still look to the Greek emperor as a natural deliverer. Peter and Michael were doubtless watching the turn of things in Sicily; but the tale of a long-hidden conspiracy between them and the whole Sicilian people has been set aside by Amari. The actual outbreak of 1282, the famous Sicilian Vespers, was stirred up by the wrongs of the moment. A gross case of insult offered by a Frenchman

1282-1735 to a Sicilian woman led to the massacre at Palermo, and the like scenes followed elsewhere The strangers were cut off, Sicily was left to its own people The towns and districts left without a ruler by no means designed to throw off the authority of the overlord, they sought the good will of Pope Martin But papal interests were on the side of Charles, and he went forth with the blessing of the church to win back his lost kingdom

Angevin oppression had brought together all Sicily in a common cause There was at last a Sicilian nation, a nation for a while capable of great deeds Sicily now stands out as a main centre of European politics But the land has lost its character, it is becoming the plaything of powers, instead of the meeting-place of nations The tale, true or false, that Frenchmen and Provençals were known from the natives by being unable to frame the Italian sound of *c* shows how thoroughly the Lombard tongue had overcome the other tongues of the island In Palermo, once city of threefold speech, a Greek, a Saracen, a Norman, who clave to his own tongue must have died with the strangers

Peter of Aragon. Charles was now besieging Messina, Sicily seems to have put on some approach to the form of a federal commonwealth Meanwhile Peter of Aragon was watching and preparing He now declared himself To all, except the citizens of the great cities, a king would be acceptable, Peter was chosen with little opposition in a parliament at Palermo, and a struggle of twenty-one years began, of which Charles and Peter saw only the first stage In fact, after Peter had helped the Sicilians to relieve Messina, he was very little in Sicily, he had to defend his kingdom of Aragon, which Pope Martin had granted to another French Charles He was represented by Queen Constance, and his great admiral Roger de Loria kept the war away from Sicily, waging it wholly in Italy, and making Charles, the son of King Charles, prisoner In 1285 both the rival kings died Charles had before his death been driven to make large legislative concessions to his subjects to stop the tendency shown, especially in Naples, to join the revolted Sicilians By Peter's death Aragon and Sicily were separated, his eldest son Alphonso took Aragon, and his

James. second son James took Sicily, which was to pass to the third son Frederick, if James died childless James was crowned, and held his reforming parliament also With the popes no terms could be made Charles, released in 1288 under a deceptive negotiation, was crowned king of Sicily by Honorius, but he had much ado to defend his continental dominions against James and Roger In 1291 James succeeded Alphonso in the kingdom of Aragon, and left Frederick not king, according to the entail, but only his lieutenant in Sicily

Frederick was the real restorer of Sicilian independence He had come to the island so young that he felt as a native He defended the land stoutly, even against his brother For James presently played Sicily false In 1295 he was reconciled to the church and released from all French claims on Aragon, and he bound himself to restore Sicily

Frederick. to Charles But the Sicilians, with Frederick at their head, disowned the agreement, and in 1296 Frederick was crowned king He had to defend Sicily against his brother and Roger de Loria, who forsook the cause, as did John of Procida Hitherto the war had been waged on the mainland, now it was transferred to Sicily King James besieged Syracuse as admiral of the Roman Church, Charles sent his son Robert in 1299 as his lieutenant in Sicily, where he gained some successes But in the same year the one great land battle of the war, that of Falconaria, was won for Sicily The war, chiefly marked by another great siege of Messina, went on till 1302, when both sides were thoroughly weakened and eager for peace By a treaty, confirmed by Pope Boniface the next year, Frederick was acknowledged as king of Trinacria for life He was to marry the daughter of the king of Sicily, to whom the island kingdom was to revert at his death The terms were never meant to be carried out Frederick again took up the title of king of Sicily, and at his death in 1337 he

Peter. was succeeded by his son Peter There were thus two Sicilian kingdoms and two kings of Sicily The king of the mainland is often spoken of for convenience as king of Naples, but that description was never borne as a formal title save in the 16th century by Philip, king of England and Naples, and in the 19th by Joseph Buonaparte and Joachim Murat The strict distinction was between Sicily on this side the Pharos (of Messina) and Sicily beyond it

Thus the great island of the Mediterranean again became an independent power And, as far as legislation could make it, Sicily became one of the freest countries in Europe By the laws of Frederick parliaments were to be regularly held, and without their consent the king could not make war, peace, or alliance The treaty of 1302 was not confirmed by parliament, and in 1337 parliament called Peter to the crown But Sicily never rose to the greatness of its Greek or its Norman days, and its old character had passed away Of Greeks and Saracens we now hear only as a degraded remnant, to be won over, if it may be, to the Western Church The kingdom had no foreign possessions, yet faint survivals of the days of Agathokles and Roger lingered on The isle of Gerba off the African coast was held for a short time, and traces of the connexion with Greece went on in various shapes If the kings of Sicily on this side the Pharos kept Corfu down to 1386, those beyond the Pharos became in 1311 overlords of Athens, when that duchy was seized by Catalan adventurers, disbanded after the wars of Sicily In 1530 the Sicilian island of Malta became the shelter of the Knights of Saint John driven by the Turk from Rhodes, and Sicily has received several colonies of Christian Albanians, who have replaced Greek and Arabic by yet another tongue

Subsequent history. There is no need to dwell at length on the Sicilian history of the last five hundred years The descendants of Frederick did not form a great dynasty Under him and after him Sicily played a part in Italian affairs, invading and being invaded on behalf of the Ghibelline cause But it was torn by dissensions between Spanish and Italian factions, and handed to and fro between one Spanish king and another At last Ferdinand the Catholic (1479-1515), king by inheritance of Aragon and of Sicily beyond the pharos, conquered the continental Sicily, and called himself king of the Two Sicilies Both were now ruled by Spanish viceroys In Charles the First (1516-1555)—Charles of Anjou is not reckoned—Sicily had a third imperial king, and once more became the starting-point for African warfare Philip, already king of Naples, became king of the Two Sicilies at the abdication of his father, and the two crowns passed along with Castile and Aragon till the division of the Spanish dominions Under the foreign rule the old laws were trampled under foot Three risings took place, that of Messina in 1672, with pretended French help, which led to deeper subjection At the death of Charles the Second in 1700, Sicily acknowledged the French claimant Philip, but the peace of Utrecht made it the kingdom of Victor Amadeus of Savoy (1713-1720) He was crowned at Palermo, but he had to withstand Spanish invasion, and to exchange Sicily for the other insular crown of Sardinia Both Sicilies now passed to the emperor Charles the Sixth, the fourth imperial king, who also is passed by in Sicilian reckoning Charles the Third is the Spanish prince of the house of Bourbon who won both Sicilies from the Austrian and who was the last king crowned at Palermo (1735)

The wars of the French Revolution again parted the Two Sicilies In 1798 Ferdinand the Fourth (1759-1825) withdrew to the island before the French armies In 1805 he withdrew again, while Joseph Buonaparte and Joachim Murat reigned on the mainland as kings of Naples Under the Bourbon rule, besides the common grievances of both kingdoms, Sicily had specially to complain of being treated as subordinate to Naples But from 1806 to 1815 Sicily, practically a separate kingdom under British protection, enjoyed a measure of wellbeing such as it had not had for some ages, and in 1812 a constitution was established The European settlement of 1815 brought back the Bourbon to his continental kingdom Ferdinand the First became a constitutional king over the United Kingdom of the Two Sicilies This was equivalent to the suppression of the separate constitution of the island, and before long all constitutional order was trodden under foot In 1820, and also in 1836 under Francis the First, Sicily rose for freedom and separation This last time the island was bound yet more firmly to continental rule In the general stir of 1848 Sicily again proclaimed her independence, and sought for herself a king in the house of Savoy Again were the liberties of Sicily trodden under foot, and, in the last change of all, the deliverance wrought by Garibaldi in 1860, if not her liberties, her ancient memories were forgotten Sicily became part of a free kingdom, but her king does not bear her style, and he has not taken the crown of Roger The very name of Sicily has been wiped out, and the great island now counts only as seven provinces of an Italian kingdom

The literature bearing on Sicily, old and new, is endless It is something for a land to have had part of its story told by Thucydides and another by Hugo Falcandus Of modern books Holm's *Geschichte Siciliens im Alterthum* (down to the accession of the second Hieron) is of great value So are the works of Michele Amari for the Moslem occupation and the War of the Vespers The old local historian Fazzello must not be passed by, nor the collections of Carusio, Pirro, and Giovanni But a history of Sicily and the cycles of its history from the beginning is still lacking The writers on particular branches of the subject are infinite Gally Knight's *Normans in Sicily* has probably led many to their first thoughts on the subject, and, as a guide for the traveller, that of Gsel-fels can hardly be outdone (E A F)

PART II —GEOGRAPHY AND STATISTICS

Plate II The island of Sicily (Ital *Sicilia*) belongs to the kingdom of Italy, being separated from the mainland only by the narrow (about 2 miles wide) but deep Straits of Messina It is nearly bisected by the meridian of 14° E, and by far the greater part lies to the south of 38° N Its southernmost point, however, in 36° 40′ N is 40′ to the north of Point Tarifa, the southernmost point of Spain and of the continent of Europe In shape it is triangular, whence the ancient poetical name of *Trinacria*, referring to its three promontories of Pelorum (now Faro) in the north-east, Pachynum (now Passaro) in the south-east, and Lilybæum (now Boeo) in the west Its area, exclusive of the adjacent small islands belonging to the *compartimento*, is, according to the recent planimetrical calculation of the Military Geographical Institute of Italy, 9860 square miles, —considerably less than one-third of that of Ireland, that of the whole *compartimento* is 9935 square miles

Geographical position The island occupies that part of the Mediterranean in which the shallowing of the waters divides that sea into two basins, and in which there are numerous indications of frequent changes in a recent geological period The channel between Cape Bon in Tunis and the south-west of Sicily (a distance of 80 miles) is, on the whole, shallower than the Straits of Messina, being for the most part under 100 fathoms in depth, and exceeding 200 fathoms only for a very short interval, while the Straits of Messina, which are at their narrowest part less than 2 miles in width, have almost everywhere a depth exceeding 150 fathoms The geological structure in the neighbourhood of this strait shows that the island must originally have been formed by a rupture between it and the mainland, but that this rupture must have taken place at a period long antecedent to the advent of man, so that the name Rhegium cannot be based even on the tradition of any such catastrophe The mountain range that runs out towards the north-east of Sicily is composed of crystalline rocks precisely similar to those forming the parallel range of Aspromonte in Calabria, but both of these are girt about by sedimentary strata belonging in part to an early Tertiary epoch That a subsequent land connexion took place, however, by the elevation of the sea-bed there is abundant evidence to show, and the occurrence of the remains of African Quaternary mammals, such as *Elephas meridionalis*, *E antiquus*, *Hippopotamus pentlandi*, as well as of those of still living African forms, such as *Elephas africanus* and *Hyæna crocuta*, makes it probable that there was a direct post-Tertiary connexion also with the African continent

The north coast is generally steep and cliffy and abundantly provided with good harbours, of which that of Palermo is the finest In the west and south the coast is for the most part flat, more regular in outline, and less favourable to shipping, while in the east, where the sea-bottom sinks rapidly down towards the eastern basin of the Mediterranean, steep rocky coasts prevail except opposite the plain of Catania In the northern half of this coast the lava streams of Mount Etna stand out for a distance of about 20 miles in a line of bold cliffs and promontories At various points on the east, north, and west coasts there are evidences of a rise of the land having taken place within historical times, at Trapani on the west coast even within the 19th century As in the rest of the Mediterranean, tides are scarcely observable, but at several points on the west and south coasts a curious oscillation in the level of the waters, known to the natives as the *marrobbio* (or *marobia*), is sometimes noticed, and is said to be always preceded by certain atmospheric signs This consists in a sudden rise of the sea-level, occasionally to the height of 3 feet, sometimes occurring only once, sometimes repeated at intervals of a minute for two hours, or even, at Mazzara, where it is most frequently observed, for twenty-four hours together Coasts

The surface of Sicily lies for the most part more than 500 feet above the level of the sea Caltanissetta, which occupies the middle point in elevation as well as in respect of geographical situation, stands 1900 feet above sea-level Considerable mountains occur only in the north, where the lower slopes of all the heights form one continuous series of olive-yards and orangeries Of the rest of the island the greater part forms a plateau varying in elevation and mostly covered with wheat-fields The only plain of any great extent is that of Catania, watered by the Simeto, in the east, to the north of this plain the active volcano of ETNA (*q v*) rises with an exceedingly gentle slope to the height of 10,868 feet from a base 400 square miles in extent This is the highest elevation of the island The steep and narrow crystalline ridge which trends north-eastwards, and is known to geographers by the name of the Peloritan Mountains, does not reach 4000 feet The Nebrodian Mountains, a limestone range connected with the Peloritan range and having an east and west trend, rise to a somewhat greater height, and farther west, about the middle of the north coast, the Madonie (the only one of the groups mentioned which has a native name) culminate at the height of nearly 6500 feet From the western end of the Nebrodian Mountains a lower range Surface

(in some places under 1500 feet in height) winds on the whole south-eastwards in the direction of Cape Passaro. With the exception of the Simeto, the principal perennial streams—the Salso, the Platani, and the Belici—enter the sea on the south coast.

Geology. Of the sedimentary rocks of Sicily none are earlier than the Secondary period, and of the older Secondary rocks there are only comparatively small patches of Triassic and Jurassic age—most abundant in the west but also occurring on the flanks of the mountains in the north-east. Cretaceous rocks are very sparingly represented (in the south-east), and by far the greater part of the island is occupied by Tertiary (mainly Eocene and Miocene) limestones. The Nebrodian Mountains are mainly composed of compact limestones of Oligocene date, but are flanked by Eocene rocks including the nummulitic limestone. Quaternary deposits border many of the bays, and the plain of Catania is wholly covered with recent alluvium. Basalts and basaltic tufas border this plain on the south, as the ancient and modern lavas of Etna do on the north.

Climate. The climate of Sicily resembles that of the other lands in the extreme south of Europe. As regards temperature, it has the warm and equable character which belongs to most of the Mediterranean region. At Palermo (where continuous observations have been made since 1791) the range of temperature between the mean of the coldest and that of the hottest month is little greater than at Greenwich. The mean temperature of January (51½° Fahr.) is nearly as high as that of October in the south of England, that of July (77° Fahr.) about 13° warmer than the corresponding month at Greenwich. During the whole period for which observations have been made the thermometer has never been observed to sink at Palermo below the freezing point; still frost does occur in the island even on the low grounds, though never for more than a few hours. On the coast snow is seldom seen, but it does fall occasionally. On the Madonie it lies till June, on Etna till July. The annual rainfall except on the higher mountains does not reach 30 inches and, as in other parts of the extreme south of Europe, it occurs chiefly in the winter months, while the three summer months (June, July, and August) are almost quite dry. During these months the whole rainfall does not exceed 2 inches, except on the slopes of the mountains in the north-east. Hence most of the streams dry up in summer. The chief scourge is the sirocco, which is experienced in its most characteristic form on the north coast, as an oppressive, parching, hot, dry wind, blowing strongly and steadily from the south, the atmosphere remaining through the whole period of its duration leaden-coloured and hazy in consequence of the presence of immense quantities of reddish dust. It occurs most frequently in April, and then in May and September, but no month is entirely free from it. Three days are the longest period for which it lasts. The same name is sometimes applied to a moist and not very hot, but yet oppressive, south-east wind which blows from time to time on the east coast. Locally the salubrity of the climate is seriously affected by the occurrence of malaria, regarding which important evidence was furnished to a Government commission of inquiry by officials of the Sicilian railways. From this it appears that the whole of the north-east coast from Catania to Messina is perfectly free from malaria, and so also is the line on the north coast from Palermo to Termini; and, singularly enough, while these parts of the low ground are free, malarial regions are entered upon in certain places as soon as the railway begins to ascend to higher levels. Such is the case with the line which crosses the island from Termini to Girgenti, and on the line which ascends from Catania to Castrogiovanni it is found that the stations become more and more unhealthy as the line ascends to Leonforte, and at that station so unhealthy are the nights that it is necessary to convey the employés by a special train every evening to Castrogiovanni (at the height of more than 3000 feet), and to bring them back by another train in the morning.

Flora. The flora of Sicily is remarkable for its wealth of species; but, comparing Sicily with other islands that have been long separated from the mainland, the number of endemic species is not great. The orders most abundantly represented are the *Compositæ*, *Cruciferæ*, *Labiatæ*, *Caryophyllaceæ*, and *Scrophulariaceæ*. The *Rosaceæ* are also abundantly represented, and among them are numerous species of the rose. The general aspect of the vegetation of Sicily, however, has been greatly affected, as in other parts of the Mediterranean, by the introduction of plants within historical times. Being more densely populated than any other large Mediterranean island, and having its population dependent chiefly on the products of the soil, it is necessarily more extensively cultivated than any other of the larger islands referred to, and many of the objects of cultivation are not originally natives of the island. Not to mention the olive, which must have been introduced at a remote period, all the members of the orange tribe, the agave, and the prickly pear, as well as other plants highly characteristic of Sicilian scenery, have been introduced since the beginning of the Christian era. With respect to vegetation and cultivation three zones may be distinguished. The first reaches to about 1600 feet above sea-level, the upper limit of the members of the orange tribe; the second ascends to about 3300 feet, the limit of the growth of wheat, the vine, and the hardier evergreens; and the third, that of forests, reaches from about 3300 feet upwards. But it is not merely height that determines the general character of the vegetation. The cultivated trees of Sicily mostly demand such an amount of moisture as can be obtained only on the mountain slopes, and it is worthy of notice that the structure of the mountains is peculiarly favourable to the supply of this want. The limestones of which they are mostly composed act like a sponge, absorbing the rain-water through their innumerable pores and fissures, and thus storing it up in the interior, afterwards to allow it to well forth in springs at various elevations lower down. In this way the irrigation which is absolutely indispensable for the members of the orange tribe during the dry season is greatly facilitated, and even those trees for which irrigation is not so indispensable receive a more ample supply of moisture during the rainy season. Hence it is that, while the plain of Catania is almost treeless and tree-cultivation is comparatively limited in the west and south, where the extent of land under 1600 feet is considerable, the whole of the north and north-east coast from the Bay of Castellamare round to Catania is an endless succession of orchards, in which oranges, citrons, and lemons alternate with olives, almonds, pomegranates, figs, carob trees, pistachios, mulberries, and vines. Oranges are specially important as an export crop, and the value of this product has enormously increased since steamers began to traverse the Mediterranean. Olives are even more extensively cultivated, but more for home consumption. The limit in height of the olive is about 2700 feet, and that of the vine about 3500. A considerable silk production depends on the cultivation of the mulberry in the neighbourhood of Messina and Catania. One of the most striking features in the commerce of the island is the very large proportion of southern fruits sent to the United States, whence petroleum is chiefly imported. Among other trees and shrubs of importance may be mentioned the deep rooted sumach, which is adapted to the driest regions, the manna ash (*Fraxinus ornus*), the American *Opuntia vulgaris* or prickly pear and the agave—the former of which yields a favourite article of diet with the natives, and both of which thrive on the driest soil—the date-palm, the plantain, various bamboos, cycads, and the dwarf palm, the last of which grows in some parts of Sicily more profusely than anywhere else, and in the desolate region in the south-west yields almost the only vegetable product of importance. The *Arundo Donax*, the tallest of European grasses, is largely grown for vine-stakes. The forests on the higher slopes of the mountains are chiefly of oak, with which are associated large numbers of the fruit-trees of central Europe, and on Etna and the Madonie chestnuts.

Cereals. Outside of the tree region wheat is by far the most important product. At the present day Sicily is still a rich granary, as it was in ancient times when Greek colonies flourished in the south and east, and later under the supremacy of Rome. In all three-fourths of the cultivated surface are estimated to be covered with cereals, and it is the cultivation of wheat more particularly which determines in most places the character of the Sicilian landscape throughout the year. The *maquis*, or thick-leaved stunted evergreens, which on the other Mediterranean islands withstand the summer drought, have been almost banished from Sicily by the extent of the wheat cultivation. Oats and barley are also grown, but maize scarcely at all, for, being a summer crop, it is almost entirely excluded from cultivation by the extreme drought of that season. Beans form in spring the chief food of the entire population. Flax is grown for its seed (linseed), and the *Crocus sativus* for the production of saffron. On the plain of Catania cotton is grown along with wheat, and among other sub-tropical products sugar (probably introduced by the Arabs about the 10th century) and tobacco are still of some importance; but the cultivation of rice has greatly declined, in consequence of its tendency to produce malaria.

The native fauna of Sicily is similar to that of Southern Italy. Among domestic animals mules and asses are very important as beasts of burden. At the enumeration of 10th January 1876 mules numbered in Sicily 112,115 out of a total of 293,868 belonging to the kingdom of Italy; the number of asses at the same date was 82,702 out of a total of 674,246 in the kingdom. The horses, sheep, and cattle are all of indifferent quality. Tunny and sardine fisheries are carried on round the coasts.

Industry and mining. Manufacturing industry is little developed in the island, and besides agriculture mining is the only important occupation of the people. The chief mineral is sulphur, Sicilian sulphur being indeed the most valuable mineral product of Italy. There are about 300 mines in operation in the provinces of Girgenti, Caltanissetta, Catania, and Palermo, employing about 27,000 people. The sulphur is found in a particular formation of the Upper Miocene, and is separated from the ore by fusion in a primitive kind of furnace called *calcaroni*, in most of which part of the sulphur is used as fuel. With the exception of a small quantity, which is used in the island for the vineyards, all the sulphur is exported, chiefly to England, France, Belgium, and the United States, and the production goes on increasing, notwithstanding the lowering of the price,

due to the extraction of sulphur from iron pyrites obtained elsewhere Before 1860 the annual production did not exceed 150,000 tons, while in 1880 it exceeded 300,000 tons, and in 1884 almost reached 400,000 tons It is estimated that at least 50,000,000 tons are still available in the island Besides sulphur, rock salt, the annual production of which is about 3000 tons, is the only important mineral product of the island, but not less than 170,000 tons of bay salt are made in the salt-pans of Trapani and other parts of the west coast The rock salt is principally excavated near Racalmuto, Casteltermini, and Trabona

Administrative divisions

The *compartimento* of Sicily is divided into seven provinces, the area and population of which are given in the following table —

Provinces	Area in sq miles	No of Communes	Pop 1881	Pop per sq mile
Caltanissetta	1270	28	266,379	210
Catania	1924	63	563,457	292
Girgenti	1165	41	312,487	268
Messina	1246	97	460,924	370
Palermo	1985	76	699,151	352
Syracuse	1439	32	341,526	237
Trapani	930	20	283,977	305
	9938	357	2,927,901	294

The areas here given are those of Strelbitsky for 1881, these giving a total which agrees better than the old official figures with the total calculated by the Military Geographical Institute, which has not yet made any calculations for the individual provinces The volcanic Lipari or Æolian Islands to the north of Sicily are included in the province of Messina, the island of Ustica to the north-west in that of Palermo, the Ægadic group (Lat *Insulæ Ægates*), consisting of a number of limestone islands in the west, in that of Trapani, from which the nearest is separated by a channel not more than nine fathoms in depth, and to the same province belongs also Pantelleria, midway between Sicily and Africa

Population

The prosperity of the island, due chiefly to the stimulation of the cultivation of southern fruits by the extension of commerce in recent years, is shown by the fact that since 1861 the population has increased more rapidly than that of any other part of the kingdom In 1861 the total population was 2,392,414, and in 1871 2,584,099 Thus the annual rate of increase was 7 74 per thousand as against 6 91 for the whole kingdom, while between 1871 and 1881 the annual increase was at the rate of 12 62 per thousand for Sicily as against 6 02 for the whole kingdom The number of emigrants is small In 1882 the number of emigrants proper (those who declared their intention of remaining out of the country for more than one year) was 2261 out of 65,748 for the whole kingdom, that of the temporary emigrants 954 as compared with 95,814

The population, which in consequence of the chequered history of the island is necessarily a very mixed one, is said to be on the whole well disposed and industrious The lawlessness indicated by the continued existence of the secret society called the *Mafia*, which, like the *Camorra* of the Neapolitan provinces of the mainland, overrides the law in taking vengeance on those who have rendered themselves obnoxious to it, is a relic of former misrule, and is diminishing under the present Government The condition of the peasantry still shows some of the injurious results of Spanish rule, under which the feudal system was introduced in its worst form The nobles, who then acquired large landed properties, collected their serfs or retainers round their own castles, so that a number of considerable towns grew up, and the country districts were to a large extent deserted The cultivators of the soil had often to walk 10 or 12 miles from their homes to their fields It is chiefly from this cause that even at the present day the people of the island are mainly congregated in towns containing not less than 5000 inhabitants each The three principal towns of Sicily and the chief seats of its foreign commerce are Palermo (population, with suburbs, 244,991 in 1881), Catania (100,417), and Messina (81,049), and the next in size are Marsala (40,251), Acireale (38,547), Trapani (38,231, the headquarters of the coral fishers of Italy), Caltanissetta (25,027), Syracuse (23,507), Sciacca (22,195), Girgenti (20,008, the centre of the trade in sulphur), Castrogiovanni (18,981), Licata (17,565), Terranova (17,173)

Education

The backward state of education is another consequence of former misrule In 1881 61 59 per cent of the inhabitants above twelve years of age were still unable to read and write (*analfabeti*), and in 1880 81 the number of pupils in the elementary public schools was only 101,724, or nearly 1 in 29 of the whole population, as against about 1 in 15 for the whole kingdom Here, however, as in other parts of Italy, improvement is going on in this respect, for the percentage of the people of Sicily above twelve years old unable to read and write was 67 59 in 1871 and 73 12 in 1861

Communication

The system of roads and railways is still defective One line of railway proceeds along the east coast from Messina to Syracuse, and a branch ascends from it to join one of the lines which cross the middle of the island from north to south Of these there are two,—one from Licata and one from Porto Empedocle, both on the south coast, these lines meet before touching the north coast a little to the east of Termini, thence the railway proceeds along the north coast to Palermo and Castellamare, whence it recrosses the island again to Mazzara, and afterwards follows the west coast northwards to Trapani A project is now (1886) entertained for the connexion of the railways of Sicily with those of the mainland by a tunnel under the Straits of Messina

See W H Smyth, *Sicily and its Islands*, London, 1824, Theo Fischer, *Beitr z phys Geogr d Mittelmeerlander, besunders Siciliens*, Leipsic, 1877, Id, "Das Klima der Mittelmeerlander," in Erganzungsband xiii of *Petermann's Mittheilungen*, Gotha, 1879 A complete account of Etna is given in Arnold von Lasaulx's edition of *Der Aetna*, by W Sartorius von Waltershausen, Leipsic, 2 vols, 1880 The best topographical map of Sicily is that based on Government surveys on the scale of 1 50,000, and on a small scale (1 800,000) that in Baedeker's *Italy* is of peculiar excellence The geology of the island is shown in a single sheet in the *Carta Geologica della Sicilia nella Scala di 1 500,000*, and in more detail on the scale of 1 100,000 in twenty seven sheets (not yet completed) See also for the geology and currents of the Straits of Messina the "Schizzo Geologico dello Stretto di Messina colla Indicazione delle Correnti Marine," in the *Bolletino del R Comitato Geologico d Italia*, 13th year, Rome, 1882 Regarding the minerals, see the third vol of *I Tesori sotterranei dell Italia* by W Jervis, Turin, 1881 (G G C)

SICKINGEN, Franz von (1481-1523), a powerful German baron, was born at Sickingen, Baden, the castle of his family, on 1st March 1481 He was the greatest of those Rhenish knights who held their lands immediately of the emperor, and was much esteemed by Maximilian I and by Charles V, to both of whom he rendered good service in war He held the position of imperial councillor and chamberlain, and won great fame as a protector of the poor and the oppressed In 1517 he was put under the ban of the empire in consequence of a war with the imperial city of Worms Afterwards he carried on wars with the duke of Lorraine, the imperial city of Metz, the landgrave Philip of Hesse, and Duke Ulrich of Wurtemberg For a short time he was disposed to serve Francis I of France, from whom he received a pension, but in the imperial election of 1519 Sickingen exercised his influence on behalf of Charles V, and in 1521 he took a prominent part, with the count of Nassau, in the war with France In 1522 an assembly at Landau elected him head of the confederation of Rhenish and Swabian barons. He was an enthusiastic adherent of the Humanists and Reformers, and when Luther seemed to be in danger offered to provide for him a place of safety Through the influence of Ulrich von Hutten, Sickingen formed a vast scheme for the overthrow of the spiritual and temporal princes, his intention being that all Germany should be brought into immediate subjection to the emperor He was so popular among the landsknechte or mercenary foot soldiers of the time that he had no difficulty in bringing together a powerful army, and in September 1522 he began the war by attacking the archbishop of Treves Much alarm was excited by this sudden movement, and the landgrave Philip and the palsgrave Louis hastened to the aid of the besieged prelate, and compelled Sickingen to withdraw from Treves He had hoped that the barons, the peasantry, and the cities would rise in support of his designs, but in this expectation he was disappointed Fortress after fortress was taken from him, and at last, in April 1523, he was besieged in the tower of Landstuhl near Kaiserslautern During the bombardment he was mortally wounded, and on 7th May 1523 he died, having capitulated almost immediately before With his defeat and death the Barons' War came to an end His son was made a count of the empire (*Reichsfreiherr*) by Maximilian II, and a descendant was raised in 1773 by Joseph II to the rank of *Reichsgraf* One line of the family continued to possess immediate estates in the lordship of Landstuhl down to 1803

SICKLE See Scythe

SICYON was a city in the east of Achaia, Greece, about 2 miles inland from the Corinthian Gulf, situated on and below a hill in the angle formed by the confluence

of the rivers Asopus and Helisson, the site is now occupied by the village of Vasilika It possessed a harbour on the coast round which was a well-fortified town, which was almost a suburb of the main city (Σικυωνίων λιμήν) The ancient and native form of the name was Σεκυών The earliest inhabitants were Ionians, but it was conquered by the Dorian invaders of Argolis, who extended their dominion over Corinth, Sicyon, and the whole valley of the Asopus Phalces, son of the first Dorian king of Argos, Temenus, was said to have been the conqueror of Sicyon and founder (οἰκιστής) of the Dorian city, which, like Corinth, probably continued for a long time subject to the powerful kings of Argos The population of the Dorian Sicyon was divided into four tribes, the Dorian conquerors constituted three—viz, the usual Dorian tribes Hylleis, Dymanes, and Pamphyli—and a part of the pre-Dorian population constituted the fourth tribe, which was called Ægialeis (Previous to the Dorian conquest the city bore, according to Strabo, the name Ægiali, or according to Pausanias Ægialeia) The rest of the ancient population were reduced to the state of serfs, called κατωνακοφόροι or κορυνηφόροι, whose position was similar to that of the Helots in Sparta As in most of the cities of Greece, the conflict between the aristocracy and the commons, who were superior in number but inferior in organization, in education, and in power, resulted in the rise of a dynasty of tyrants, the Orthagoridæ, who destroyed the rule of the Dorian oligarchy and reigned in Sicyon for a century, from about 665 B C. Under the strong hand of these dynasts Sicyon attained great wealth Lying near the great commercial centre Corinth, and possessing a harbour, it shared in the immense development of trade with the Italian peninsula which took place in the 8th and 7th centuries Its marine was considerable, though apparently never of the first rank, at a later time it sent fifteen triremes to fight against the Persians at Salamis The bronze work of Sicyon was renowned, as Strabo mentions, and we may gain some conception of its style from some of the bronzes found at Olympia, which have probably been fabricated either at Sicyon or in the closely connected workshops of Argos The Dædalid sculptors Dipœnus and Scyllis from Crete settled in Sicyon about the beginning of the 6th century, and gave the first impulse to a school of art, working mainly in bronze or in wood covered with bronze, which lasted for some generations at Sicyon, Corinth, and Argos, and played a very prominent part in the development of Greek art The early bronze work of the Sicyo-Argive workshops in all probability formed the model after which the Hesiodic description of the Shield of Hercules was composed by a poet of the 7th century The fame of Sicyonian bronze work gave rise to the epithet Τελχινία, which was sometimes applied to the city Terra-cotta vases which have been fabricated at Sicyon are found in Etruria, whither they were exported in the Italian trade They closely resemble in style the vases of Corinth, from which they are distinguished by the peculiar form of the letter *epsilon* in the inscriptions painted on them, and they usually belong to the 6th century. The market-gardens of the fertile Asopus valley supplied the populous Corinth with fruit and vegetables At least in later times the fine shoes made in Sicyon were widely used in Greece In the 4th century Sicyon continued to be one of the foremost states in an artistic point of view The Sicyonian school of painting was founded by Eupompus, and some of the greatest foreign artists, such as Pamphilus and Apelles, studied in it Lysippus also, who gave a new impulse and tone to Greek sculpture, was a native of Sicyon

In the dynasty of the Orthagoridæ Andreas began to reign about 665, his son Myron before 648, of Aristonymus, son of Myron, nothing is known, Myron II, son of Aristonymus, reigned seven years, Isodamus, brother and murderer of Myron II, reigned a short time, and about 596 was replaced by his younger brother Clisthenes, who ruled till about 565 The dynasty ended with Clisthenes, who had no son, but his institutions continued in force for sixty years longer, until Sicyon came under the influence of the Peloponnesian confederacy, in which the Dorian Sparta was the chief power The policy of the Orthagoridæ had always been strongly anti-Dorian, and under the Dorian reaction the most unfavourable colour was given to their actions, hence grew the extremely unpleasant picture of them in the pages of Herodotus, who gives the current Peloponnesian accounts of the 5th century These accounts are contradicted by the long rule of the dynasty and the permanence of their policy after their extinction Myron I won a chariot-race at Olympia in 648, and dedicated a bronze θάλαμος (probably a large chest or ναΐσκος covered with bronze) with an inscription, which Pausanias saw in the Olympian treasury of the Sicyonians The building of this treasury is ascribed to him by Pausanias, but excavation has shown that the building is not earlier than 500, it consists of a simple cella with a pronaos *in antis*, and is built of Sicyonian stones, cut and numbered at Sicyon, and thence transported by water to Olympia Clisthenes was the most powerful and famous of the Sicyonian despots, and he continued the anti-Dorian policy of his predecessors, but, as we have seen, it is impossible to trust the details of his action as given by Herodotus (v 67) He is said to have forbidden the rhapsodists to recite the epics in which the fame of Dorian heroes was sung, and to have encouraged the worship of Dionysus, a non-Dorian deity Another object of his policy was to secure the favour of the Delphian oracle, and he used all his power in the Sacred War on the side of Delphi against Crissa (590 B C) He won a victory in the chariot-race at Delphi in 582 Clisthenes had no son, and he desired to obtain the noblest of the Greeks as a husband for his daughter Agariste The story of the wooing of Agariste as it was current in Athens, probably in poetic form, has been preserved by Herodotus Clisthenes, when declared victor at the Olympian games (572 or 568), invited the best of the Greeks to Sicyon Twelve representatives from all parts of Greece (whose names are chosen by the poet with little regard to chronological possibility) assembled there and spent a year as guests of Clisthenes First among them all were two Athenians, one of whom, Megacles the Alcmæonid, was at last preferred to his rival Hippoclides, and the careless remark of the latter, "Hippoclides cares not," became proverbial Megacles and Agariste were parents of Clisthenes, who became famous after 510 as the second founder of the Athenian democracy, and their grand-daughter Agariste was mother of the still more famous Pericles When Sicyon again came under the Dorian influence shortly before 500, the oligarchical form of government was reintroduced and lasted till about 369, when the democracy was again established, but its form was used by Euphron to exercise his own power, and after him a series of tyrants ruled the city, till in 251 Aratus reintroduced the democratic government and Sicyon joined the Achæan league Under the Roman rule Sicyon profited by the destruction of Corinth in 146 B C, it received part of the Corinthian territory together with the presidency of the Isthmian games But it sank into decay as Corinth revived, and was almost depopulated when Pausanias visited it in the 2d century after Christ Among the bishoprics of the Byzantine time New Sicyon occurs regularly, it is probable that this was a town on a new site near the old city (W M RA)

SIDDONS, SARAH (1755-1831), English actress, was the eldest of twelve children of Roger Kemble, the manager of a company of strolling players, and his wife Sarah Ward, and was born in the "Shoulder of Mutton" public-house, Brecon, Wales, 5th July 1755 Through the special care of her mother in sending her to the schools in the towns where the company played she received a remarkably good education, although she was accustomed to make her appearance on the stage while still a mere child She became attached to William Siddons, an actor of the company, but this was discountenanced by her parents, who wished her to accept the offer of a squire Siddons was dismissed from the company, and she was sent to a situation as lady's maid in Warwickshire, at last, however, the necessary consent was obtained and the marriage took place at Trinity Church, Coventry, on 26th November 1773 It was while playing at Cheltenham in the following year that Mrs Siddons met with the earliest decided recognition of her great powers as an actress, when by her representation of Belvidera in *Venice Preserved* she moved to tears a party of "people of quality" who had come to "scoff" Her merits

were made known by them to Garrick, who sent his deputy to Cheltenham to report regarding her abilities, the result being that she was engaged to appear at Drury Lane at a salary of £5 a week Owing to inexperience as well as other circumstances, her first appearances as Portia and in other parts were unfortunate, and when, after playing with success in Birmingham, she was about to return to town she received a note from the manager of Drury Lane stating that her services would not be required Thus, in her own words, "banished from Drury Lane as a worthless candidate for fame and fortune," she again in the beginning of 1777 went "on the circuit" in the provinces After a very successful engagement at Bath from 1778 to 1782, she again accepted an offer from Drury Lane, when her appearance in Southern's *Isabella* was one continued triumph, only equalled in the history of the English stage by that of Garrick's first night at Drury Lane in 1741 and that of Edmund Kean's in 1814 In her earlier years it was in scenes of a tender and melting character that she exercised the strongest sway over an audience, but in the performance of Lady Macbeth, in which she appeared February 1785, it was the grandeur of her exhibition of the more terrible passions as related to one awful purpose that held them spellbound In Lady Macbeth she found the highest and best scope for her gifts It fitted her as no other character did, and as perhaps it will never fit another actress Her extraordinary and peculiar physical endowments—tall and striking figure, brilliant beauty, powerfully expressive eyes, and solemn dignity of demeanour—enabled her to confer a weird majesty on the character which inexpressibly heightened the tragic awe surrounding her fate After Lady Macbeth she played Desdemona, Rosalind, and Ophelia, all with great success, but it was in Queen Catherine—which she first played on her brother's spectacular revival of *Henry VIII* in 1788—that she discovered a part almost as well adapted to her peculiar powers as that of Lady Macbeth In her early life she had attempted comedy, but her gifts in this respect were very limited. It was of course inevitable that comparisons should be made between her and her only compeer Rachel, who undoubtedly excelled her in intensity and the portrayal of fierce passion, but was a less finished artist and lacked Mrs Siddons's dignity and pathos Though Mrs Siddons's minute and systematic study perhaps gave a certain amount of stiffness to her representations, it conferred on them a symmetry and proportion to which Rachel never attained Mrs Siddons formally retired from the stage 29th June 1812, but occasionally appeared on special occasions even when advanced in years In private life she enjoyed the friendship and respect of a wide circle, including many of the most eminent persons of her time She died at London on 8th June 1831

See Thomas Campbell, *Life of Mrs Siddons* (2 vols, 1834), Fitzgerald, *The Kembles* (3 vols, 1871), and Frances Ann Kemble, *Records of a Girlhood* (3 vols, 1878)

SIDI-BEL-ABBÈS, chief town of an arrondissement in the department of Oran, Algeria, lies 48 miles by rail to the south of that town, at an elevation of 1552 feet above sea-level, on the right bank of the Mekerra (afterwards the Sig), and surrounded by a plain which is dominated by the escarpments of Mount Tessala. The town, encircled by a crenellated and bastioned wall with a fosse, is traversed from east to west and from north to south by two wide streets shaded by plane trees, the gates are four in number, named from Oran, Daia, Mascara, and Tlemcen respectively There are numerous fountains fed from the Mekerra The civil and military quarters of the town are quite distinct from one another The population of Sidi-bel-Abbès in 1881 was 13,298, or, including the commune, 16,840, the Spanish considerably preponderates over the French element The town, which is of quite recent origin, derives its name from a chapel, near which a redoubt was constructed by General Bedeau in 1843 The surrounding country is healthy, fertile, and populous

SIDMOUTH, VISCOUNT See ADDINGTON, HENRY

SIDNEY, or SYDNEY, ALGERNON (1622-1683), was the second son of Robert, second earl of Leicester, and of Dorothy Percy, daughter of Henry, earl of Northumberland, and was born at Penshurst, Kent, in 1622 As a boy he showed much talent, which was carefully trained under his father's eye In 1632 with his elder brother he accompanied his father on his mission as ambassador extraordinary to Christian IV of Denmark, whom he saw at Rendsburg In May 1636 Sidney went with his father to Paris, where he became a general favourite, and from there to Rome In October 1641 he was given a troop in his father's regiment in Ireland, of which his brother, Lord Lisle, was in command In August 1643 the brothers returned to England At Chester their horses were taken by the Royalists, whereupon they again put out to sea and landed at Liverpool Here they were detained by the Parliamentary commissioners, and by them sent up to London for safe custody Whether this was intended by Sidney or no, it is certain that from this time he ardently attached himself to the Parliamentary cause On 10th May 1644 he was made captain of horse in Manchester's army, under the Eastern Association He was shortly afterwards made lieutenant-colonel, and charged at the head of his regiment at Marston Moor (2d July), where he was wounded and rescued with difficulty. On 2d April 1645 he was given the command of a cavalry regiment in Cromwell's division of Fairfax's army, was appointed governor of Chichester on 10th May, and in December was returned to parliament for Cardiff In July 1646 his regiment was ordered to Ireland, and he was made lieutenant-general of horse in that kingdom and governor of Dublin Leaving London on 1st February 1647, Sidney arrived at Cork on the 22d He was soon (8th April), however, recalled by a resolution of the House passed through the interest of Lord Inchiquin On 7th May he received the thanks of the House of Commons On 13th October 1648 he was made lieutenant of Dover castle, of which he had previously been appointed governor He was at this time identified with the Independents as opposed to the Presbyterian party He was nominated one of the commissioners to try Charles I, but took no part in the trial, retiring to Penshurst until sentence was pronounced That Sidney approved of the trial, though not of the sentence, there can, however, be little doubt, for in Copenhagen he publicly and vigorously expressed his concurrence On 15th May 1649 he was a member of the committee for settling the succession and for regulating the election of future parliaments Sidney lost the governorship of Dover, however, in March 1651, in consequence, apparently, of a quarrel with his officers He then went to The Hague, where he quarrelled with Lord Oxford at play, and a duel was only prevented by their friends He returned to England in the autumn, and henceforward took an active share in parliamentary work On 25th November Sidney was elected on the council of state and was evidently greatly considered In the usurpation of Cromwell, however, he utterly refused all concurrence, nor would he leave his place in parliament except by force when Cromwell dispersed it on 19th April 1653 He immediately retired to Penshurst, where he was concerned chiefly with family affairs In 1654 he again went to The Hague, and there became closely acquainted with De Witt. On his return he kept entirely aloof from public affairs, and it is to this period that the *Essay on Love* is ascribed

Upon the restoration of the Long Parliament, 7th May

1659, Sidney again took his seat, and was placed on the council of state He showed himself in this office especially anxious that the military power should be duly subordinated to the civil On 5th June he was appointed one of three commissioners to mediate for a peace between Denmark supported by Holland and Sweden He was probably intended to watch the conduct of Montague, who was in command of the Baltic squadron Of his character we have an interesting notice from Whitelocke, who refused to accompany him on the ground of his "overruling temper and height" Upon the conclusion of the treaty he went to Stockholm as plenipotentiary, and in both capacities he behaved with resolution and address When the restoration of Charles II took place Sidney left Sweden, 28th June 1660, bringing with him from the king of Sweden a rich present in testimony of the estimation in which he was held Sidney went first to Copenhagen, and then, being doubtful of his reception by the English court, settled at Hamburg From there he wrote a celebrated letter vindicating his conduct, which will be found in the Somers *Tracts* He shortly afterwards left Hamburg, and passed through Germany by way of Venice to Rome His stay there, however, was embittered by misunderstandings with his father and consequent straits for money Five shillings a day, he says, served him and two men very well for meat, drink, and firing He devoted himself to the study of books, birds, and trees, and speaks of his natural delight in solitude being largely increased In 1663 he left Italy, passed through Switzerland, where he visited Ludlow, and came to Brussels in September, where his portrait was painted by Van Egmondt, it is now at Penshurst He had thoughts of joining the imperial service, and offered to transport from England a body of the old Commonwealth men, but this was refused by the English court It is stated that the enmity against him was so great that now, as on other occasions, attempts were made to assassinate him On the breaking out of the Dutch war Sidney, who was at The Hague, urged an invasion of England, and shortly afterwards went to Paris, where he offered to raise a rebellion in England on receipt of 100,000 crowns Unable, however, to come to terms with the French Government, he once more went into retirement in 1666,—this time to the south of France In August 1670 he was again in Paris, and Arlington proposed that he should receive a pension from Louis, Charles II agreed, but insisted that Sidney should return to Languedoc In illustration of his austere principles it is related that, Louis having taken a fancy to a horse belonging to him and insisting on possessing it, Sidney shot the animal, which, he said, "was born a free creature, had served a free man, and should not be mastered by a king of slaves" His father was now very ill, and after much difficulty Sidney obtained leave to come to England in the autumn of 1677 Lord Leicester died in November, and legal business connected with other portions of the succession detained Sidney from returning to France as he had intended He soon became involved in political intrigue, joining, in general, the country party, and holding close communication with Barillon, the French ambassador In the beginning of 1679 he stood for Guildford, and was warmly supported by William Penn, with whom he had long been intimate, and to whom he afforded assistance in drawing up the constitution of Pennsylvania He was defeated by court influence, and his petition to the House, complaining of an undue return, never came to a decision His *Letters to Henry Savile*, written at this period, are of great interest He was in Paris, apparently only for a short while, in November 1679 Into the prosecution of the Popish Plot Sidney threw himself warmly, and was among those who looked to Monmouth, rather than to Orange, to take the place of James in the succession, though he afterwards disclaimed all interest in such a question He now stood for Bramber (Sussex), again with Penn's support, and a double return was made He is reported on 10th August 1679 as being elected for Amersham (Buckingham) with Sir Roger Hill When parliament met, however, in October 1680, his election was declared void But now, under the idea that an alliance between Charles and Orange would be more hostile to English liberty than would the progress of the French arms, he acted with Barillon in influencing members of parliament in this sense, and is twice mentioned as receiving the sum of 500 guineas from the ambassador Of this there is no actual proof, and it is quite possible that Barillon entered sums in his accounts with Louis which he never paid away In any case it is to be remembered that Sidney is not charged with receiving money for advocating opinions which he did not enthusiastically hold

Upon the dissolution of the last of Charles's parliaments the king issued a justificatory declaration This was at once answered by a paper entitled *A Just and Modest Vindication, &c*, the first sketch of which is imputed to Sidney It was then, too, that his most celebrated production, the *Discourses concerning Government*, was concluded, in which he upholds the doctrine of the mutual compact and traverses the High Tory positions from end to end In especial he vindicates the propriety of resistance to kingly oppression or misrule, upholds the existence of an hereditary nobility interested in their country's good as the firmest barrier against such oppression, and maintains the authority of parliaments In each point the English constitution, which he ardently admires, is, he says, suffering the prerogatives of the crown are disproportionately great, the peerage has been degraded by new creations, and parliaments are slighted

For a long while Sidney kept himself aloof from the duke of Monmouth, to whom he was introduced by Lord Howard. After the death of Shaftesbury, however, in November 1682, he entered into the conferences held between Monmouth, Russell, Essex, Hampden, and others That treasonable talk went on seems certain, but it is probable that matters went no further The watchfulness of the court was, however, aroused, and on the discovery of the Rye House Plot, Sidney, who had always been regarded in a vague way as dangerous, was arrested while at dinner on 26th June 1683 His papers were carried off, and he was sent at once to the Tower on a charge of high treason For a considerable while no evidence could be found on which to establish a charge Jeffreys, however, was made lord chief-justice in September, a jury was packed, and, after consultations between the judge and the crown lawyers, Sidney was brought to listen to the indictment on 7th November The trial, which began on 21st November, was conducted with a shameless absence of equity Sidney was refused a copy of the indictment, in direct violation of law, and—more shameful still—he was refused the assistance of counsel Hearsay evidence and the testimony of the perjured informer Lord Howard, whom Sidney had been instrumental in introducing to his friends, were first produced This being insufficient, partial extracts from papers found in Sidney's study, and supposed only to be in his handwriting, in which the lawfulness of resistance to oppression was upheld, were next relied on He was indicted for "conspiring and compassing the death of the king" Sidney conducted his case throughout with great skill, he pointed especially to the fact that Lord Howard, whose character he easily tore to shreds, was the only witness against him as to treason, whereas the law required two, that the treason was not accurately defined, that no proof had been given that the papers produced

were his, and that, even if that were proved, these papers were in no way connected with the charge. Against the determination to secure a conviction, however, his courage, eloquence, coolness, and skill were of no avail, and the verdict of "guilty" was given. On 25th November Sidney presented a petition to the king, praying for an audience, which, however, under the influence of James and Jeffreys, Charles refused. On the 26th he was brought up for judgment, and again insisted on the illegality of his conviction. Upon hearing his sentence he gave vent to his feelings in a few noble and beautiful words. Jeffreys having suggested that his mind was disordered, he held out his hand and bade the chief-justice feel how calm and steady his pulse was. By the advice of his friends he presented a second petition, offering, if released, to leave the kingdom at once and for ever. The supposed necessity, however, of checking the hopes of Monmouth's partisans, caused the king to be inexorable. The last days of Sidney's life were spent in drawing up his *Apology* and in discourse with Independent ministers. He was beheaded on the morning of 7th December 1683. His remains were buried at Penshurst. (O. A.)

SIDNEY, SIR PHILIP (1554-1586), although killed at the early age of thirty-two, was one of the most conspicuous figures at the court of Elizabeth, was known to the leading statesmen of Europe as a soldier and statesman of the highest promise, took a permanent place in history and legend as a romantic hero, and in literature is distinguished as the author of the first important body of English sonnets and a writer whose works mark a distinct advance in English prose. He was born at Penshurst in Kent on 29th November 1554. His father was Sir Henry Sidney, famous in his time as an administrator of Ireland, his mother a Dudley, sister of Elizabeth's favourite, the earl of Leicester, and daughter of the earl of Northumberland executed for high treason in the reign of Mary. Thus Sidney was of notable kindred on both sides—

> "Others, because of both sides I do take
> My blood from them who did excel in this,
> Think Nature me a man-at-arms did make."[1]

He received his scholastic education at Shrewsbury school and at Christ Church, Oxford. He was entered at Shrewsbury on the same day with his lifelong friend and biographer Fulke Greville, afterwards Lord Brooke. In 1572 he set out with three years' leave of absence to complete his education by Continental travel; he was in Paris at the house of the English ambassador on the night of the massacre of St Bartholomew, and went thence to Frankfort, Vienna, and the chief cities of Italy. During these travels he associated with scholars and statesmen, making an earnest study of European politics, winning golden opinions for his youthful gravity and sagacity. From that time Hubert Languet, the Reformer, whom he met at Frankfort, maintained a constant correspondence with him. On his return he was introduced at court, won the favour of Elizabeth, who considered him "one of the jewels of her crown," and, in proof of the versatility which made him one of the wonders of his age, wrote a masque, *The Lady of the May*, for Leicester's great reception of the queen at Kenilworth, and distinguished himself in the tournament upon the same occasion. In 1577, at the age of twenty-two, being sent as ambassador in great state to congratulate and sound Rudolph II., the new emperor of Germany, he met William the Silent, who pronounced him one of the ripest statesmen in Europe. He returned in the following year, and from that time till the expedition to the Netherlands, in which he lost his life, he had no public employment, but lived partly at court, partly at his country seat at Penshurst in Kent. In 1583 he married the daughter of Sir Francis Walsingham, who after his death became countess of Essex. His most memorable interference in state affairs was a bold letter of remonstrance to Elizabeth against her suspected policy of marrying the duke of Anjou. The queen's anger at his boldness drove him for a time into retirement. He was a strong advocate of intervention on the Protestant side, and in 1585 accompanied Leicester in his expedition to the Netherlands, and was appointed governor of Flushing, one of the towns held by the queen as security. The historical truth of the famous incident at the battle of Zutphen (22d September 1586), when the wounded hero passed a cup of water to a dying soldier, has been questioned; but it is matter of fact that he owed his death to an impulse of romantic generosity. The lord marshal happening to enter the field of Zutphen without greaves, Sidney cast off his also, to put his life in the same peril, and thus exposed himself to the fatal shot. His death took place fifteen days later, on 7th October 1586, at Arnheim.

No poet's death was ever so lamented by poets as Sidney's. Pastoral elegy was in fashion, and all the numerous poets and rhymesters of the time from Spenser to Davison hastened to lay their tribute of verse on the bier of this the darling of all the shepherds—

> "With whom all joy and jolly merriment
> Is also deaded and in dolour drent."

That there was much more than the worship of his rank and his bright eager personality in this is shown by the lasting reputation of what he wrote during the two years of retirement, 1580-81, which he seems to have given mainly to literature. The truth is that Sidney transferred his own strong, radiant, graceful, and lovable character to his writings with a freshness and fidelity such as few finished artists have achieved, so that he really and literally lives in them to charm for ever. None of his writings were published during his lifetime, and the dates of composition are uncertain. But it would seem that Sidney's first attempt at verse was a metrical version of the Psalms, written in conjunction with his sister, the countess of Pembroke,—"Sidney's sister, Pembroke's mother." The worth of these paraphrases, which have all Sidney's qualities of sincerity, directness, and sweetness of rhythm, has recently been recognized by Mr Ruskin, who has edited them under the title of *Rock Honeycomb* in the second volume of his *Bibliotheca Pastorum* (1877). Sidney's famous prose romance, *The Countess of Pembroke's Arcadia*, the "vain amatorious poem" with which Charles I. solaced his imprisonment, was also begun in 1580. It was published in 1590, and kept its popularity as long as that kind of high-flown sentiment and intricate adventure found readers. The buoyancy and freshness of Sidney's style give a certain air of reality even to the artificial scenes of the *Arcadia*, and many pretty songs are interspersed through the work. Sidney's greatest poetic achievement, however, was the series of sonnets entitled *Astrophel and Stella*, the first important body of sonnets in the English language. The sonnets, 110 in number, are a chronicle of the poet's love for Penelope Devereux, sister of the earl of Essex, afterwards Lady Rich. He first met the lady when she was a child of twelve at one of the stages in Elizabeth's progress to Kenilworth in 1575. A match was apparently arranged between them by their families, but upon Leicester's disgrace it was broken off and Penelope was given to Lord Rich. Sidney seems then to have discovered that he was in love with her. Whether the passion was real or feigned for artistic purposes is of little consequence, although the reality of it has been hotly maintained; he writes as if it were real, and the verisimilitude of the story recorded in the sonnets, which express his varying moods towards her throughout the incidents of subsequent intercourse and the distractions of his public life, adds greatly to their interest. Very few of the sonnets will bear separation from the context, though there is hardly one that does not contain some sweet ingenuity of fancy or casual felicity of phrase. Some of them were special favourites with Charles Lamb. Sidney's other work during this busy literary passage in his short life, the *Apologie for Poetrie*, has also established itself as a classic.

The best of the sonnets are selected by Mrs Ward in Ward's *English Poets*; Mr Main also makes a good selection in his *Treasury of English Sonnets*. The sonnets were probably written in 1581; they were not published till 1591, when they formed the first in a brilliant series of volumes of sonnet literature (see "Elizabethan Sonneteers," in Minto's *Characteristics of English Poets*). The *Apologie* is included in Arber's reprints.

SIDON (Arab. *Saida*), long the principal city of PHŒNICIA (*q.v.*), and even in the Middle Ages a place of importance, but now little more than a mere village, is situated on the Syrian coast in 33° 36′ N. lat. and 35° 20′

[1] *Astrophel and Stella*, sonnet 41.

9″ E long, about midway between Sur (Tyre) and Beirut (Beyrout) The ancient city extended some 800 yards farther inland, over ground now occupied by luxuriant fruit-gardens, on the produce of which the inhabitants of the town live In front of the flat promontory to which the modern Sidon is confined there stretches northwards and southwards a rocky peninsula, at the northern extremity of this begins a series of small rocks enclosing the harbour, which at present is a very bad one, having been, to some extent at least, purposely filled up The port was formerly protected on the north by the Kal'at el-Bahr ("Sea Castle"), a building of the 13th century, situated upon an island still connected with the mainland by a bridge On the south side of the town lay the so-called Egyptian harbour, now quite useless The wall by which Sidon is at present surrounded is pierced by two gates, those of Beirut and Akko (Acre), at the south-eastern angle, upon a heap of rubbish, stand the remains of the citadel The streets are very narrow, and the buildings of any interest are few, most prominent are some large caravanserais belonging to the period of Sidon's modern prosperity, and the large mosque, formerly a church of the Knights of St John Sidon looks best from the north Of its 9000 inhabitants 7000 are Mohammedans, there are a number of institutions conducted by Catholic and Protestant Christians In the neighbourhood are large Phœnician burial-places, which have been partially explored by Renan, the natives also engage in the search for antiquities The principal finds are sarcophagi, and next to these sculptures and paintings The most important discovery hitherto made has been that of the sarcophagus of Eshmunazar with a long inscription, it is now (1886) in the Louvre

In 637-638 Sidon was taken by the Arabs During the crusades it was alternately in possession of the Franks and the Mohammedans, but finally fell into the hands of the latter in 1291 As the residence of the Druse emir Fakhr ed-Dín, it rose to some prosperity about the beginning of the 17th century, but towards the close of the 18th its commerce again passed away, principally to Beirut (Beyrout), and the prosperity of Sidon has ever since been steadily declining

SIEBENBURGEN See TRANSYLVANIA

SIEBOLD, CARL THEODOR ERNST VON (1804-1885), physiologist and zoologist, the son of a physician and a descendant of what Oken called the "Asclepiad family of Siebolds," was born at Wurzburg on 16th February 1804 Educated in medicine and science chiefly at the university of Berlin, he became successively professor of zoology, physiology, and comparative anatomy in Konigsberg, Erlangen, Freiburg, Breslau, and Munich In conjunction with Stannius he published (1845-48) a *Manual of Comparative Anatomy*, which is still of solid value, and along with Kolliker he founded in 1848 a journal which soon took and still retains a leading place in biological literature, *Zeitschrift fur wissenschaftliche Zoologie* He was also a laborious and successful helminthologist (see PARASITISM) and entomologist, in both capacities contributing many valuable papers to his journal, which he continued to edit until his death in 1885 In these ways, without being a man of marked genius, but rather an industrious and critical observer, he came to fill a peculiarly distinguished position in science, and was long reckoned, what his biographer justly calls him, the Nestor of German zoology See Ehlers, *Zeitschr f wiss Zool*, 1885

SIEBOLD, PHILIPP FRANZ VON (1796-1866), scientific explorer of Japan and elder brother of the physiologist noticed above, was born at Wurzburg, Germany, on 17th February 1796 He studied medicine and natural science at Wurzburg, and obtained his doctor's diploma in 1820 In 1822 he entered the service of the king of the Netherlands as medical officer to the East Indian army On his arrival at Batavia he was attached to a new mission to Japan, sent by the Dutch with a view to improve their trading relations with that country Siebold was well equipped with scientific apparatus, and he remained in Japan for six years, with headquarters at the Dutch settlement on the little island of Deshima His medical qualifications enabled him to find favour with the Japanese, and he gathered a vast amount of information concerning a country then almost as little known as Corea, especially concerning its natural history and ethnography He had comparatively free access to the interior, and his reputation spreading far and wide brought him visitors from all parts of the country His valuable stores of information were added to by trained natives whom he sent to collect for him in the interior In 1824 he published *De Historiæ Naturalis in Japonia Statu* and in 1832 his splendid *Fauna Japonica* His knowledge of the language enabled him also in 1826 to issue from Batavia his *Epitome Linguæ Japonicæ* In Deshima he also laid the foundation of his *Catalogus Librorum Japonicorum* and *Isagoge in Bibliothecam Japonicam*, published after his return to Europe, as also his *Bibliotheca Japonica*, which, with the co-operation of J Hoffmann, appeared at Leyden in 1833 During the visit which he was permitted to make to Yedo (Tokio), Siebold made the best of the rare opportunity, his zeal, indeed, outran his discretion, since, for obtaining a native map of the country, he was thrown into prison and compelled to quit Japan on 1st January 1830 On his return to Holland he was raised to the rank of major, and in 1842 to that of colonel After his arrival in Europe he began to give to the world the fruits of his researches and observations in Japan His *Nippon, Archiv zur Beschreibung von Japan und dessen Neben- und Schutz-Landern* was issued in five quarto volumes of text, with six folio volumes of atlas and engravings He also issued many fragmentary papers on various aspects of Japan In 1854 he published at Leyden *Urkundliche Darstellung der Bestrebungen Niederlands und Russlands zur Eroffnung Japans* In 1859 Siebold undertook a second journey to Japan, and was invited by the emperor to his court In 1861 he obtained permission from the Dutch Government to enter the Japanese service as negotiator between Japan and the powers of Europe, and in the same year his eldest son was made interpreter to the English embassy at Yedo Siebold was, however, soon obliged by various intrigues to retire from his post, and ultimately from Japan Returning by Java to Europe in 1862, he set up his ethnographical collections, which were ultimately secured by the Government of Bavaria and removed to Munich He continued to publish papers on various Japanese subjects, and received honours from many of the learned societies of Europe He died at Munich on 18th October 1866 Siebold until recent years was our great authority on Japan, and even now his writings on the natural history of that country have not been superseded

See biography by Moritz Wagner, in *Allgemeine Zeitung*, 13th to 16th November 1866

SIEDLCE (Russ *Syedlets*), a government of Russian Poland, between the Vistula and the Bug, having Warsaw on the N W, Łomza on the N, Grodno and Volhynia on the E, Lublin and Radom on the S Its area is 5535 square miles The surface is mostly flat, only a few hilly tracts appearing in the middle, around Biała, and in the east on the banks of the Bug Extensive marshes prevail in the north and south-east Chalk, Jurassic, and Tertiary deposits cover the surface, and are overlain in their turn with widely spread Glacial deposits The valley of

the Vistula is mostly wide, with several terraces covered with sand-dunes or peat-bog Siedlce is watered by the Vistula, which borders it for 50 miles on the west, the Bug, which is navigable from Opalin and flows for 170 miles on the east and north-east borders of the province, the Wieprz, a tributary of the Vistula, which is also navigable, and flows for 25 miles along the southern boundary, and the Liwiec, a tributary of the Bug, which is navigable for some 30 miles below Wengroff

Of the total surface of the government only 184 760 acres are unproductive, 695,420 acres are covered with forests, 1,703,100 are under crops, and 611,260 under meadows and pasture land The population only increases at the rate of 0 75 per cent a year, and in 1884 numbered 630,240, of these Poles constituted 39 7 per cent, Little Russians 43 1, Jews 15 1, and Germans about 2 According to religious belief they were distributed as follows — out of 616,649 inhabitants in 1882 there were 367,187 Catholics, 142,945 Orthodox Greeks, 96,764 Jews, 8892 Protestants, 505 Baptists, and 356 Mohammedan Tatars Agriculture is the chief occupation, in 1881 the crops yielded 1,531,400 quarters of corn and 10,988,400 bushels of potatoes Cattle breeding is in a relatively flourishing state, there being (1881) 57,500 horses, 292,670 horned cattle, 461,700 sheep, and 194,100 pigs Manufactures are insignificant (2270 workmen), their aggregate production, chiefly from distilleries and breweries, was valued at £394,820 in 1881 Trade also is insignificant, although Siedlce has four railways, one of which, from Warsaw to Brest-Litovsk, crosses it from west to east There are two gymnasia for boys (at Siedlce and Biała), one gymnasium for girls, one seminary for teachers (at Biała), and about 240 primary schools with 11,260 scholars The government is divided into nine districts, the chief towns of which, with their populations in 1882, are—Siedlce (see below), Biała (19,435), Constantinoff (3200), Garvolin (14,620), Łukoff (11,030), Radzyn (4440), Sokołoff (6300), Wengroff (8140), and Włodawa (17,985) Janoff (3030), where a state stud is kept, has also municipal institutions

SIEDLCE, capital of the above government, is situated 57 miles east-south-east of Warsaw, on the Brest-Litovsk Railway It received municipal institutions in 1547 The Oginskis, to whom it belonged, have embellished it with a palace and gardens, but it is still nothing more than a large village, where the provincial authorities have their seat Its population was 12,950 in 1882

SIEGE See FORTIFICATION

SIEGEN, an ancient mining and manufacturing town of Prussia, in the province of Westphalia, is situated 47 miles to the east of Cologne on the Sieg, a tributary entering the Rhine opposite Bonn The surrounding district, to which it gives its name, abounds in iron-mines, so that iron founding and smelting are important branches of industry in and near the town Large tanneries and leather-works, and factories for cloth paper, and machinery, are among the other industrial establishments The population in 1880 was 15,024, of whom 3632 were Roman Catholics and 111 Jews

Siegen was the capital of an early principality belonging to the house of Nassau, and from 1606 onwards it gave name to the junior branch of Nassau-Siegen Napoleon incorporated Siegen in the grand-duchy of Berg in 1806, and in 1815 the congress of Vienna assigned it to Prussia, under whose rule it has nearly quintupled its population Rubens is said to have been born here in 1577

SIEGFRIED See NIBELUNGENLIED, vol xvii p 475

SIEMENS, SIR WILLIAM (1823-1883), christened Carl Wilhelm, an eminent inventor, engineer, and natural philosopher, was born at Lenthe in Hanover on 4th April 1823 After being educated in the polytechnic school of Magdeburg and the university of Gottingen, he visited England at the age of nineteen, in the hope of introducing a process in electro-plating invented by himself and his brother Werner The invention was adopted by Messrs Elkington, and Siemens returned to Germany to enter as a pupil the engineering works of Count Stolberg at Magdeburg In 1844 he was again in England with another invention, the "chronometric" or differential governor for steam-engines (see STEAM-ENGINE). Finding that British patent laws afforded the inventor a protection which was then wanting in Germany, he thenceforth made England his home, but it was not till 1859 that he formally became a naturalized British subject After some years spent in active invention and experiment at mechanical works near Birmingham, he went into practice as an engineer in 1851 He laboured mainly in two distinct fields, the applications of heat and the applications of electricity, and was characterized in a very rare degree by a combination of scientific comprehension with practical instinct In both fields he played a part which would have been great in either alone, and, in addition to this, he produced from time to time miscellaneous inventions and scientific papers sufficient in themselves to have established a reputation His position was recognized by his election in 1862 to the Royal Society, and later to the presidency of the Institute of Mechanical Engineers, the Society of Telegraph Engineers, the Iron and Steel Institute, and the British Association, by honorary degrees from the universities of Oxford, Glasgow, Dublin, and Wurzburg, and by knighthood He died in London on the 19th of November 1883

In the application of heat Siemens's work began just after Joule's experiments had placed the doctrine of the conservation of energy on a sure basis While Rankine, Clausius, and Thomson were developing the dynamical theory of heat as a matter of physical and engineering theory, Siemens, in the light of the new ideas, made a bold attempt to improve the efficiency of the steam-engine as a converter of heat into mechanical work Taking up the regenerator —a device invented by Stirling twenty years before, the importance of which had meanwhile been ignored—he applied it to the steam-engine in the form of a regenerative condenser with some success This was in 1847, and in 1855 engines constructed on Siemens's plan were worked at the Paris exhibition Later he made many attempts to apply the regenerator to internal-combustion or gas engines, but neither in steam-engines nor in gas engines were his inventions directly and permanently fruitful, though the direction they followed is that in which improvement is still looked for The regenerative principle, however, as a means of economizing heat soon received at his hands another and far wider application In 1856 he introduced the regenerative furnace, the idea of his brother Friedrich, with whom William associated himself in directing its applications In an ordinary furnace a very large part of the heat of combustion is lost by being carried off in the hot gases which pass up the chimney In the regenerative furnace the hot gases pass through a regenerator, or chamber stacked with loose bricks, which absorb the heat When the bricks are well heated the hot gases are diverted so to pass through another similar chamber, while the air necessary for combustion, before it enters the furnace, is made to traverse the heated chamber, taking up as it goes the heat which has been stored in the bricks After a suitable interval the air currents are again reversed The process is repeated periodically, with the result that the products of combustion escape only after being cooled, the heat which they take from the furnace being in great part carried back in the heated air But another invention was required before the regenerative furnace could be thoroughly successful This was the use of gaseous fuel, produced by the crude distillation and incomplete combustion of coal in a distinct furnace, now known as Siemens's gas-producer From this the gaseous fuel passes by a flue to the regenerative furnace, and it, as well as the entering air, is heated by the regenerative method, four brick-stacked chambers being used instead of two The complete invention was applied at Chance's glass-works in Birmingham in 1861, and furnished the subject of Faraday's farewell lecture to the Royal Institution It was soon applied to many industrial processes, but it found its greatest development a few years later at the hands of Siemens himself in the manufacture of steel To produce steel directly from the ore, or by melting together wrought-iron scrap with cast iron upon the open hearth, had been in his mind from the first, but it was not till 1867, after two years of experiment in "sample steel works" erected by himself for the purpose, that he achieved success The modern forms of the Siemens steel process are described in the article IRON (vol xiii p 347 *sq*) The product is a mild steel of exceptionally trustworthy quality, the use of which for boiler-plates has done much to make possible the high steam-pressures that are now common, and has consequently contributed, indirectly, to that improvement in the thermodynamic efficiency of heat engines which Siemens had so much at heart Just before his death he was again at work upon the same subject, his plan being to use gaseous fuel from a Siemens producer in place of solid fuel beneath the boiler, and to apply the regenerative principle to boiler furnaces His faith in gaseous fuel led him to anticipate that its use would in time supersede that of solid coal for domestic and industrial purposes, cheap gas being supplied either from special works or direct from the pit, and

among his last inventions was a house grate to burn gas along with coke, which he regarded as a possible cure for city smoke

In electricity Siemens's name is closely associated with the growth of land and submarine telegraphs, the invention and development of the dynamo, and the application of electricity to lighting and to locomotion In 1860, with his brother Werner, he invented the earliest form of what is now known as the Siemens armature, and in 1867 he communicated a paper to the Royal Society "On the Conversion of Dynamical into Electrical Force without the aid of Permanent Magnetism," in which he announced the invention by Werner Siemens of the dynamo electric machine, an invention which was also reached independently and almost simultaneously by Wheatstone and by S A Varley The Siemens-Alteneck or multiple coil armature followed in 1873, and became the basis of the modern Siemens dynamo as developed, with great labour, by the firm of Siemens Brothers themselves, and (with later modifications) by Edison, Hopkinson, and others While engaged in constructing a trans-Atlantic cable for the Direct United States Telegraph Company, Siemens designed the very original and successful ship "Faraday," by which that and other cables were laid One of the last of his works was the Portrush and Bushmills electric tramway, in the north of Ireland, opened in 1883, where the water-power of the river Bush drives a Siemens dynamo, from which the electric energy is conducted to another dynamo serving as a motor on the car In the Siemens electric furnace the intensely hot atmosphere of the electric arc between carbon points is employed to melt refractory metals Another of the uses to which he turned electricity was to employ light from arc lamps as a substitute for sunlight in hastening the growth and fructification of plants Among his miscellaneous inventions were the differential governor already alluded to, and a highly scientific modification of it, described to the Royal Society in 1866, a water-meter which acts on the principle of counting the number of turns made by a small reaction turbine through which the supply of water flows, an electric thermometer and pyrometer, in which temperature is determined by its effect on the electrical conductivity of metals, an attraction meter for determining very slight variations in the intensity of a gravity, and the bathometer, by which he applied this idea to the problem of finding the depth of the sea without a sounding line In a paper read before the Royal Society in 1882 "On the Conservation of Solar Energy," he suggested a bold but unsatisfactory theory of the sun's heat, in which he sought to trace on a cosmic scale an action similar to that of the regenerative furnace His fame, however, does not rest on his contributions to pure science, valuable as some of these were His strength lay in his grasp of scientific principles, in his skill to perceive where and how they could be applied to practical affairs, in his zealous and instant pursuit of thought with action, and in the indomitable persistence with which he clung to any basis of effort that seemed to him theoretically sound

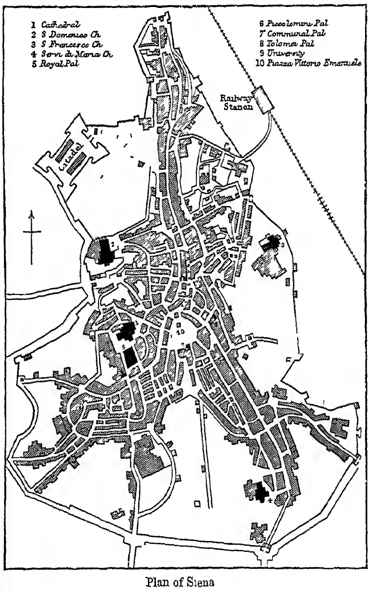
Siemens's writings consist for the most part of lectures and papers scattered through the scientific journals and the publications of the Royal Society, the Institution of Civil Engineers, the Institute of Mechanical Engineers, the Iron and Steel Institute, the British Association, &c A biography by Dr William Pole is now (1886) in preparation (J A E)

SIENA, a city of Italy, and one of the most characteristic of Tuscany, stands (43° 19′ N lat, 11° 19′ E long) on a hill near the mountainous region of Chianti, the Maremma, and Val di Chiana It is 60 miles by rail south of Florence and 160 north-west of Rome The area of the city within the walls is about $2\frac{1}{2}$ square miles and its population in 1881 was 25,204 The province of Siena, comprising about 1467 square miles, with 37 communes, and a total population of 207,000, by the political redistribution of 1882 forms a single electoral college and returns four members to parliament The diocese of Siena, an archbishopric dating from 1459, includes 18 city and 95 rural parishes divided into 12 vicariates

Public institutions The city possesses a university, founded in 1203 and limited to the faculties of law and medicine Among the other public institutions the following are the more important —the town library, first opened to students in the 17th century, the Archivio, a record office, instituted in 1858, containing a valuable and splendidly arranged collection of documents, the Fine Arts Institution, founded in 1816; and the natural history museum of the Royal Academy of the Physiocritics, inaugurated in the same year There are also many flourishing charities, including an excellent hospital and a school for the deaf and dumb

Festivals The public festivals of Siena known as the "Palio delle Contrade" have a European celebrity They are held in the public square, the curious and historic Piazza del Campo (now Piazza di Vittorio Emanuele), on 2d July and 16th August of each year, they date from the Middle Ages and were instituted in commemoration of victories and in honour of the Virgin Mary (the old title of Siena, as shown by seals and medals, having been "Sena vetus civitas Virginis") In the 15th and 16th centuries the celebrations consisted of bull-fights At the close of the 16th century these were replaced by races with mounted buffaloes, and since 1650 by (ridden) horses Siena is divided into seventeen *contrade* (wards), each with a distinct appellation and a chapel and flag of its own, and every year ten of these *contrade*, chosen by lot, send each one horse to compete for the prize *palio* or banner The aspect of Siena during these meetings is very characteristic, and the whole festivity bears a mediæval stamp in harmony with the architecture and history of the town

Cathedral Among the noblest fruits of Sienese art are the public buildings adorning the city The cathedral, one of the finest examples of Italian Gothic architecture, was begun in the early years of the 13th century, and in 1317 its walls were extended to the baptistery of San Giovanni, a further enlargement was begun in 1339 but never carried out, and a few ruined walls and arches alone remain to show the magnificence of the uncompleted design The splendid west front, of tricuspidal form, enriched with a multitude of columns, statues, and inlaid marbles, was finished in 1380 Space



Plan of Siena

fails for the enumeration of the art treasures of the interior, but conspicuous among them is the well-known octagonal pulpit by Niccolò Pisano, dating from about 1274 The cathedral pavement is almost unique It is inlaid with designs in colour and black and white, representing Biblical and legendary subjects, and is supposed to have been begun by Duccio della Buoninsegna But the finest portions beneath the domes, with scenes from the history of Abraham, Moses, and Elijah, are by Domenico Beccafumi and are executed with marvellous boldness and effect The choir stalls also deserve mention the older ones (remains of the original choir) are in *tarsia* work, the others, dating from the 16th century, are carved from Riccio's designs The Piccolomini Library, adjoining the *duomo*, was founded by Cardinal Francesco Piccolomini Todeschini

(afterwards Pius III.) in honour of his uncle, Pius II. Here are Pinturicchio's famous frescos of scenes from the life of the latter pontiff and the collection of choir books (supported on sculptured desks) with splendid illuminations by Sienese and other artists. The church of San Giovanni, the ancient baptistery, beneath the cathedral is approached by an outer flight of marble steps built in 1451. It has a beautiful façade designed by Giovanni di Mino del Pellicciaio in 1382, and a marvellous font with bas-reliefs by Donatello, Ghiberti, Giacomo della Quercia, and other 15th century sculptors. **Churches.** The other churches are—the Collegiata di Provenzano, a vast building of some elegance, designed by Schifardini (1594); Sant' Agostino, rebuilt by Vanvitelli in 1755, containing a Crucifixion and Saints by Perugino, a Massacre of the Innocents by Matteo di Giovanni, the Coming of the Magi by Sodoma, and a St Antony by Spagnoletto or his school; the beautiful church of the Servites (15th century), which contains another Massacre of the Innocents by Matteo di Giovanni and other good examples of the Sienese school; San Francesco, designed by Agostino and Agnolo about 1326, and now (1887) being restored, which once possessed many fine paintings by Duccio Buoninsegna, Lorenzetti, Sodoma, and Beccafumi, but some of these perished in the great fire of 1655, and the rest were removed to the Institute of Fine Arts after 1862 during the temporary desecration of the church; San Domenico, a fine 13th century building with a single nave and transept, containing Sodoma's splendid fresco the Swoon of St Catherine, the Madonna of Guido da Siena, and a crucifix by Sano di Pietro. This church crowns the Fontebranda hill above the famous fountain of that name immortalized by Dante, and in a steep lane below stands the house of St Catherine, now converted into a church and oratory, and maintained at the expense of the inhabitants of the Contrada dell' Oca. It contains some good pictures by Pacchia and other works of art, but is chiefly visited for its historic interest and as a striking memorial of the characteristic piety of the Sienese.

Municipal buildings. The communal palace in the Piazza del Campo was begun in 1288 and finished in 1309. It is built of brick, is a fine specimen of Pointed Gothic, and was designed by Agostino and Agnolo. The light and elegant tower (Torre del Mangia) soaring from one side of the palace was begun in 1325, and the chapel standing at its foot, raised at the expense of the Opera del Duomo as a public thank-offering after the plague of 1348, dates from 1352. This grand old palace has other attractions besides the beauty of its architecture, for its interior is lined with works of art. The atrium has a fresco by Bartolo di Fredi and the two ground-floor halls contain a Coronation of the Virgin by Sano di Pietro and a splendid Resurrection by Sodoma. In the Sala dei Nove or della Pace above are the noble allegorical frescos of Ambrogio Lorenzetti representing the effects of just and unjust government; the Sala delle Balestre or del Mappamondo is painted by Simone di Martino (Memmi) and others, the Cappella della Signoria by Taddeo di Bartolo, and the Sala del Concistorio by Beccafumi. Another hall is now being prepared in memory of Victor Emmanuel II., and its frescos and decorations are to be entrusted exclusively to Sienese artists. The former hall of the grand council, built in 1327, was converted into the chief theatre of Siena by Riccio in 1560, and, after being twice burnt, was rebuilt in 1753 from Bibbiena's designs. Another Sienese theatre, the Rozzi, in Piazza San Pellegrino, designed by A. Doveri and erected in 1816, although modern, has an historic interest as the work of an academy dating from the 16th century, called the Congrega de' Rozzi, that played an important part in the history of the Italian comic stage.

Palaces, &c. The city is adorned by many other noble edifices both public and private, of which we will mention the following palaces—the Tolomei (1205); Buonsignori, formerly Tegliacci, an elegant 14th-century construction, restored in 1848; Grottanelli, formerly Pecci and anciently the residence of the captain of war, recently restored in its original style; Sansedoni; Marsili; Piccolomini, now belonging to the Government and containing the state archives; Piccolomini delle Papesse, like the other Piccolomini mansion, designed by Bernardo Rossellino, and now the national bank; the enormous block of the Monte de' Paschi, enlarged and partly rebuilt in the original style between 1877 and 1881, and including the old Dogana and Spannocchi palaces; the Loggia di Mercanzia (15th century), now a club; the Loggia del Papa, erected by Pius II.; and other fine buildings. We must also mention the two celebrated fountains, Fonte Gaia and Fontebranda; the Fonte Nuova, near Porta Ovile, by Camaino di Crescentino also deserves notice. Thanks to all these architectural treasures, the narrow Sienese streets with their many windings and steep ascents are full of picturesque charm, and, together with the collections of excellent paintings, foster the local pride of the inhabitants and preserve their taste and feeling for art.

History.—The origin of Siena, like that of other Italian cities, is lost in a mist of legendary tradition. It was probably founded by the Etruscans, and then falling under the Roman rule became a colony in the reign of Augustus, or a little earlier, and was distinguished by the name of *Sæna Julia*. Few memorials of the Roman era or of the first centuries of Christianity have been preserved, and none at all of the interval preceding the Lombard period. We have documentary evidence that during this epoch, in the reign of Rotaris (or Rotari), there was a bishop of Siena named Mouro. Attempts to trace earlier bishops as far back as the 5th century have yielded only vague and contradictory results. Under the Lombards the civil government was in the hands of a *gastaldo*, under the Carolingians of a count, whose authority, by slow degrees and a course of events similar to what took place in other Italian communes, gave way to that of the bishop, whose power in turn gradually diminished and was superseded by that of the consuls and the commonwealth.

Struggle between nobles and popolani. We have written evidence of the consular government of Siena from 1125 to 1212; the number of consuls varied from three to twelve. This government, formed of *gentiluomini* or nobles, did not remain unchanged throughout the whole period, but was gradually forced to accept the participation of the *popolani* or lower classes, whose efforts to rise to power were continuous and determined. Thus in 1137 they obtained a third part of the government by the reconstitution of the general council with 100 nobles and 50 *popolani*. In 1199 the institution of a foreign *podestà* gave a severe blow to the consular magistracy, which was soon extinguished; and in 1233 the people again rose against the nobles in the hope of ousting them entirely from office. The attempt was not completely successful; but the Government was now equally divided between the two estates by the creation of a supreme magistracy of twenty-four citizens,—twelve nobles and twelve *popolani*. During the rule of the nobles and the mixed rule of nobles and *popolani* the commune of Siena was enlarged by fortunate acquisitions of neighbouring lands and by the submission of feudal lords, such as the Scialenghi, Aldobrandeschi, Pannocchieschi, Visconti di Campiglia, &c. Before long the reciprocal need of fresh territory and frontier disputes, especially concerning Poggibonsi and Montepulciano, led to an outbreak of hostilities between Florence and Siena. Thereupon, to spite the rival republic, the Sienese took the Ghibelline side, and the German emperors, beginning with Frederick Barbarossa, rewarded their fidelity by the grant of various privileges.

War with Florence. During the 12th and 13th centuries there were continued disturbances, petty wars, and hasty reconciliations between Florence and Siena, until in 1254-55 a more binding peace and alliance was concluded. But this treaty, in spite of its apparent stability, led in a few years to a fiercer struggle; for in 1258 the Florentines complained that Siena had infringed its terms by giving refuge to the Ghibellines they had expelled, and on the refusal of the Sienese to yield to these just remonstrances both states made extensive preparations for war. Siena applied to Manfred, obtained from him a strong body of German horse, under the command of Count Giordano, and likewise sought the aid of its Ghibelline allies. Florence equipped a powerful citizen army, of which the original registers are still preserved in the volume entitled *Il Libro di Montaperti* in the Florence archives. This army, led by the podestà of Florence and twelve burgher captains, set forth gaily on its march towards the enemy's territories in the middle of April 1260, and during its first campaign, ending 18th May, won an insignificant victory at Santa Petronilla, outside the walls of Siena. But in a second and more important campaign, in which the militia of the other Guelf towns of Tuscany took part, the Florentines were signally defeated at Montaperti on 4th September 1260. This defeat crushed the power of Florence for many years, reduced the city to desolation, and apparently annihilated

the Florentine Guelfs But the battle of Benevento (1266) and the establishment of the dynasty of Charles of Anjou on the Neapolitan throne put an end to the Ghibelline predominance in Tuscany Ghibelline Siena soon felt the effects of the change in the defeat of its army at Colle di Valdelsa (1269) by the united forces of the Guelf exiles, Florentines, and French, and the death in that battle of her powerful citizen Provenzano Salvani (mentioned by Dante), who had been the leading spirit of the Government at the time of the victory of Montaperti For some time Siena remained faithful to the Ghibelline cause, nevertheless Guelf and democratic sentiments began to make head The Ghibellines were on several occasions expelled from the city, and, even when a temporary reconciliation of the two parties allowed them to return, they failed to regain their former influence

Success of popular party

Meanwhile the popular party acquired increasing power in the state Exasperated by the tyranny of the Salimbeni and other patrician families allied to the Ghibellines, it decreed in 1277 the exclusion of all nobles from the supreme magistracy (consisting since 1270 of thirty-six instead of twenty-four members), and insisted that this council should be formed solely of Guelf traders and men of the middle class This constitution was confirmed in 1280 by the reduction of the supreme magistracy to fifteen members, all of the humbler classes, and was definitively sanctioned in 1285 (and 1287) by the institution of the magistracy of nine This council of nine, composed only of burghers, carried on the government for about seventy years, and its rule was sagacious and peaceful The territories of the state were enlarged, a friendly alliance was maintained with Florence, trade flourished, in 1321 the university was founded, or rather revived, by the introduction of Bolognese scholars, the principal buildings now adorning the town were begun, and the charitable institutions, which are the pride of modern Siena, increased and prospered But meanwhile the exclusiveness of the single class of citizens from whose ranks the chief magistrates were drawn had converted the government into a close oligarchy and excited the hatred of every other class Nobles, judges, notaries, and populace rose in frequent revolt, while the nine defended their state (1295-1309) by a strong body of citizen militia divided into *terzieri* (sections) and *contrade* (wards), and violently repressed these attempts But in 1355 the arrival of Charles IV in Siena gave fresh courage to the malcontents, who, backed by the imperial authority, overthrew the government of the nine and substituted a magistracy of twelve drawn from the lowest class These new rulers were to some extent under the influence of the nobles who had fomented the rebellion, but the latter were again soon excluded from all share in the government This was the beginning of a determined struggle for supremacy, carried on for many years, between the different classes of citizens, locally termed *ordini* or *monti*,—the lower classes striving to grasp the reins of government, the higher classes already in office striving to keep all power in their own hands, or to divide it in proportion to the relative strength of each *monte* As this struggle is of too complex a nature to be described in detail, we must limit ourselves to a summary of its leading episodes

Council of nine

Rule of the twelve

The twelve who replaced the council of nine (as these had previously replaced the council of the nobles) consisted —both as individuals and as a party—of ignorant, incapable, turbulent men, who could neither rule the state with firmness nor confer prosperity on the republic They speedily broke with the nobles, for whose manœuvres they had at first been useful tools, and then split into two factions, one siding with the Tolomei, the other, the more restless and violent, with the Salimbeni and the *noveschi* (partisans of the nine), who, having still some influence in the city, probably fomented these dissensions, and, as we shall see later on, skilfully availed themselves of every chance likely to restore them to power In 1368 the adversaries of the twelve succeeded in driving them by force from the public palace, and substituting a government of thirteen,—ten nobles and three *noveschi* This government lasted only twenty-two days, from 2d to 24th September, and was easily overturned by the dominant faction of the *dodicini* (partisans of the twelve), aided by the Salimbeni and the populace, and favoured by the emperor Charles IV The nobles were worsted, being driven from the city as well as from power, but the absolute rule of the twelve was brought to an end, and right of participation in the government was extended to another class of citizens For, on the expulsion of the thirteen from the palace, a council of 124 plebeians created a new magistracy of twelve *difensori* (defenders), no longer drawn exclusively from the order of the twelve, but composed of five of the *popolo minuto*, or lowest populace (now first admitted to the government), four of the twelve, and three of the nine But it was of short duration, for the *dodicini* were ill satisfied with their share, and in December of the same year (1368) joined with the *popolo minuto* in an attempt to expel the three *noveschi* from the palace But the new popular order, which had already asserted its predominance in the council of the *riformatori*, now drove out the *dodicini*, and for five days (11th to 16th December) kept the government in its own hands Then, however, moved by fear of the emperor, who had passed through Siena two months before on his way to Rome, and who was about to halt there on his return, it tried to conciliate its foes by creating a fresh council of 150 *riformatori*, who replaced the twelve defenders by a new supreme magistracy of fifteen, consisting of eight *popolani*, four *dodicini*, and three *noveschi*, entitled respectively "people of the greater number," "people of the middle number," and "people of the less number" From this renewal dates the formation of the new order or *monte dei riformatori*, the title henceforth bestowed on all citizens, of both the less and the greater people, who had reformed the government and begun to participate in it in 1368 The turbulent faction of the twelve and the Salimbeni, being dissatisfied with these changes, speedily rose against the new Government This time they were actively aided by Charles IV, who, having returned from Rome, sent his militia, commanded by the imperial vicar Malatesta da Rimini, to attack the public palace But the Sienese people, being called to arms by the council of fifteen, made a most determined resistance, routed the imperial troops, captured the standard, and confined the emperor in the Salimbeni palace Thereupon Charles came to terms with the Government, granted it an imperial patent, and left the city, consoled for his humiliation by the gift of a large sum of money

Riformatori and council of fifteen

In spite of its wide basis and great energy, the *monte dei riformatori*, the heart of the new Government, could not satisfactorily cope with the attacks of adverse factions and treacherous allies So, the better to repress them, it created in 1369 a chief of the police, with the title of *esecutore*, and a numerous association of *popolani*—the company or *casata grande* of the people—as bulwarks against the nobles, who had been recalled from banishment, and who, though fettered by strict regulations, were now eligible for offices of the state But the appetite for power of the "less people" and the dregs of the populace was whetted rather than satisfied by the installation of the *riformatori* in the principal posts of authority Among the wool-carders—men of the lowest class, dwelling in the precipitous lanes about the Porta Ovile—there was an

association styling itself the 'company of the worm' During the famine of 1371 this company rose in revolt, sacked the houses of the rich, invaded the public palace, drove from the council of fifteen the four members of the twelve and the three of the nine, and replaced them by seven tatterdemalions Then, having withdrawn to its own quarter, it was suddenly attacked by the infuriated citizens (*noveschi* and *dodicini*) who broke into houses and workshops and put numbers of the inhabitants to the sword without regard for age or sex Thereupon the popular rulers avenged these misdeeds by many summary executions in the piazza These disorders were only checked by fresh changes in the council of fifteen It was now formed of twelve of the greater people and three *noveschi*, to the total exclusion of the *dodicini*, who, on account of their growing turbulence, were likewise banished from the city

Contention for Arezzo

Meanwhile the Government had also to contend with difficulties outside the walls The neighbouring lords attacked and ravaged the municipal territories, grave injuries were inflicted by the mercenary bands, especially by the Bretons and Gascons The rival claims to the Neapolitan kingdom of Carlo di Durazzo and Louis of Anjou caused fresh disturbances in Tuscany The Sienese Government conceived hopes of gaining possession of the city of Arezzo, which was first occupied by Durazzo's men, and then by Enguerrand de Coucy for Louis of Anjou, but while the Sienese were nourishing dreams of conquest the French general unexpectedly sold the city to the Florentines, whose negotiations had been conducted with marvellous ability and despatch (1384) The gathering exasperation of the Sienese, and notably of the middle class, against their rulers was brought to a climax by this cruel disappointment Their discontent had been gradually swelled by various acts of home and foreign policy during the sixteen years' rule of the *riformatori*, nor had the concessions granted to the partisans of the twelve and the latter's recall and renewed eligibility to office availed to conciliate them At last the revolt broke out and gained the upper hand, in March 1385 The *riformatori* were ousted from power and expelled the city, and the trade of Siena suffered no little injury by the exile of so many artisan families The fifteen were replaced by a new supreme magistracy of ten priors, chosen in the following proportions,—four of the twelve, four of the nine, and two of the people proper, or people of the greater number, but to the exclusion of all who had shared in the government or sat in council under the *riformatori* Thus began a new order or *monte del popolo*, composed of families of the same class as the *riformatori*, but having had no part in the government during the latter's rule But, though now admitted to power through the burgher reaction, as a concession to democratic ideas, and to cause a split among the greater people, they enjoyed very limited privileges [1]

Magistracy of the ten priors

Subjection to Milan

In 1387 fresh quarrels with Florence on the subject of Montepulciano led to an open war, that was further aggravated by the interference in Tuscan affairs of the ambitious duke of Milan, Gian Galeazzo Visconti With him the Sienese concluded an alliance in 1389 and ten years later accepted his suzerainty and resigned the liberties of their state But in 1402 the death of Gian Galeazzo lightened their yoke In that year the first plot against the Viscontian rule, hatched by the twelve and the Salimbeni and fomented by the Florentines, was violently repressed, and caused the twelve to be again driven from office, but in the following year a special *balia*, created in consequence of that riot annulled the ducal suzerainty and restored the liberties of Siena During the interval the supreme magistracy had assumed a more popular form By the partial readmission of the *riformatori* and exclusion of the twelve, the permanent *balia* was now composed of nine priors (three of the nine, three of the people, and three of the *riformatori*) and of a captain of the people to be chosen from each of the three *monti* in turn On 11th April peace was made with the Florentines and Siena enjoyed several years of tranquil prosperity

Quarrels with Florence

But the great Western schism then agitating the Christian world again brought disturbance to Siena In consequence of the decisions of the council of Pisa, Florence and Siena had declared against Gregory XII (1409), Ladislaus of Naples, therefore, as a supporter of the pope, seized the opportunity to make incursions on Sienese territory, laying it waste and threatening the city The Sienese maintained a vigorous resistance till the death of this monarch in 1414 freed them from his attacks In 1431 a fresh war with Florence broke out, caused by the latter's attempt upon Lucca, and continued in consequence of the Florentines' alliance with Venice and Pope Eugenius IV, and that of the Sienese with the duke of Milan and Sigismund, king of the Romans This monarch halted at Siena on his way to Rome to be crowned, and received a most princely welcome In 1433 the opposing leagues signed a treaty of peace, and, although it was disadvantageous to the Sienese and temptations to break it were frequently urged upon them, they faithfully adhered to its terms During this period of comparative tranquillity Siena was honoured by the visit of Pope Eugenius IV (1443) and by that of the emperor Frederick III, who came there to receive his bride, Eleanor of Portugal, from the hands of Bishop Æneas Sylvius Piccolomini, his secretary and historian (1452) This meeting is recorded by the memorial column still to be seen outside the Camollia gate In 1453 hostilities against Florence were again resumed, on account of the invasions and ravages of Sienese territory committed by Florentine troops in their conflicts with Alphonso of Naples, who since 1447 had made Tuscany his battle-ground Peace was once more patched up with Florence in 1454 Siena was next at war for several years with Aldobrandino Orsini, count of Pitigliano, and with Jacopo Piccinini, and suffered many disasters from the treachery of its generals About the same time the republic was exposed to still graver danger by the conspiracy of some of its leading citizens to seize the reins of power and place the city under the suzerainty of Alphonso, as it had once been under that of the duke of Milan But the plot came to light, its chief ringleaders were beheaded, and many others sent into exile (1456), and the death of Alphonso at last ended all danger from that source During those critical times the government of the state was strengthened by a new executive magistracy called the *balìa*, which from 1455 began to act independently of the priors or consistory Until then it had been merely a provisional committee annexed to the latter But henceforward the *balìa* had supreme jurisdiction in all affairs of the state, although always, down to the fall of the republic, nominally preserving the character of a magistracy extraordinary The election of Æneas Sylvius Piccolomini to the papal chair in 1458 caused the utmost joy to the Sienese, and in compliment to their illustrious fellow-citizen they granted the request of the nobles and readmitted them to a share in the government But this concession, grudgingly made, only remained in force for a few years, and on the death of the pope (1464) was revoked altogether, save in the case of members of the Piccolomini house, who were decreed to be *popolani* and

Institution of the balia

[1] The following are the *ordini* or *monti* that held power in Siena for any considerable time—*gentiluomini*, from the origin of the republic, *nove*, from about 1285, *dodici*, from 1355, *riformatori*, from 1368, *popolo*, from 1385

were allowed to retain all their privileges. Meanwhile fresh discords were brewing among the plebeians at the head of affairs.

Revolution of 1480. The conspiracy of the Pazzi in 1478 led to a war in which Florence and Milan were opposed to the pope and the king of Naples, and which was put an end to by the peace of 13th March 1480. Thereupon Alphonso, duke of Calabria, who was fighting in Tuscany on the side of his father Ferdinand, came to an agreement with Siena and, in the same way as his grandfather Alphonso, tried to obtain the lordship of the city and the recall of the exiled rebels of 1456. The *noveschi* (to whose order most of the rebels belonged) favoured his pretensions, but the *riformatori* were against him. Many of the people sided with the *noveschi*, rose in revolt on 22d June 1480, and, aided by the duke's soldiery, reorganized the government to their own advantage. Dividing the power between their two orders of the nine and the people, they excluded the *riformatori* and replaced them by a new and heterogeneous order styled the *aggregati*, composed of nobles, exiles of 1456, and citizens of other orders who had never before been in office. But this violent and perilous upset of the internal liberties of the republic did not last long. A decree issued by the Neapolitan king (1482) depriving the Sienese of certain territories in favour of Florence entirely alienated their affections from that monarch. Meanwhile the *monte* of the nine, the chief promoters of the revolution of 1480, were exposed to the growing hatred and envy of their former allies, the *monte del popolo*, who, conscious of their superior strength and numbers, now sought to crush the *noveschi* and rise to power in their stead. This change of affairs was accomplished by a series of riots between 7th June 1482 and 20th February 1483. The *monte del popolo* seized the lion's share of the government; the *riformatori* were recalled, the *aggregati* abolished, and the *noveschi* condemned to perpetual banishment from the government and the city. But "in perpetuo" was an empty form of words in those turbulent Italian republics. The *noveschi*, being "fat burghers" with powerful connexions, abilities, and traditions, gained increased strength and influence in exile; and five years later, on 22d July 1487, they returned triumphantly to Siena, dispersed the few adherents of the *popolo* who offered resistance, murdered the captain of the people, reorganized the state, and placed it under the protection of the Virgin Mary. And, their own predominance being assured by their numerical strength and influence, they accorded equal shares of power to the other *monti*.

Pandolfo Petrucci. Among the returned exiles was Pandolfo Petrucci, chief of the *noveschi* and soon to be at the head of the Government. During the domination of this man (who, like Lorenzo de' Medici, was surnamed "the Magnificent") Siena enjoyed many years of splendour and prosperity. We use the term "domination" rather than "signory" inasmuch as, strictly speaking, Petrucci was never lord of the state, and left its established form of government intact; but he exercised despotic authority in virtue of his strength of character and the continued increase of his personal power. He based his foreign policy on alliance with Florence and France, and directed the internal affairs of the state by means of the council (*collegio*) of the *balìa*, which, although occasionally reorganized for the purpose of conciliating rival factions, was always subject to his will. He likewise added to his power by assuming the captainship of the city guard (1495), and later by the purchase from the impoverished commune of several outlying castles (1507). Nor did he shrink from deeds of bloodshed and revenge: the assassination of his father-in-law, Niccolò Borghesi (1500), is an indelible blot upon his name. He successfully withstood all opposition within the state, until he was at last worsted in his struggle with Cesare Borgia, who caused his expulsion from Siena in 1502. But through the friendly mediation of the Florentines and the French king he was recalled from banishment on 29th March 1503. He maintained his power until his death at the age of sixty on 21st May 1512, and was interred with princely ceremonials at the public expense. The predominance of his family in Siena did not last long after his decease. Pandolfo had not the qualities required to found a dynasty such as that of the Medici. He lacked the lofty intellect of a Cosimo or a Lorenzo, and the atmosphere of liberty-loving Siena with its ever-changing factions was in no way suited to his purpose. His eldest son, Borghese Petrucci, was incapable, haughty, and exceedingly corrupt; he only remained three years at the head of affairs and fled ignominiously in 1515. Through the favour of Leo X. he was succeeded by his cousin Raffaello Petrucci, previously governor of St Angelo and afterwards a cardinal.

Under the protection of the emperor. This Petrucci was a bitter enemy to Pandolfo's children. He caused Borghese and a younger son named Fabio to be proclaimed as rebels, while a third son, Cardinal Alphonso, was strangled by order of Leo X. in 1518. He was a tyrannical ruler, and died suddenly in 1522. In the following year Clement VII. insisted on the recall of Fabio Petrucci, but two years later a fresh popular outbreak drove him from Siena for ever. The city then placed itself under the protection of the emperor Charles V., created a magistracy of "ten conservators of the liberties of the state" (December 1524), united the different *monti* in one named the "*monte* of the reigning nobles," and, rejoicing to be rid of the last of the Petrucci, dated their public books, *ab instaurata libertate* year I., II., and so on.

The so-called free government subject to the empire lasted for twenty-seven years; and the desired protection of Spain weighed more and more heavily until it became a tyranny. The imperial legates and the captains of the Spanish guard in Siena crushed both Government and people by continual extortions and by undue interference with the functions of the *balìa*. Charles V. passed through Siena in 1535, and, as in all the other cities of enslaved Italy, was received with the greatest pomp; but he left neither peace nor liberty behind him. From 1527 to 1545 the city was torn by faction fights and violent revolts against the *noveschi*, and was the scene of frequent bloodshed. The *balìa* was reconstituted several times by the imperial agents,—in 1530 by Don Lopez di Soria and Alphonso Piccolomini, duke of Amalfi, in 1540 by Granvella (or Granvelle), and in 1548 by Don Diego di Mendoza; but government was carried on as badly as before, and there was increased hatred of the Spanish rule. When in 1549 Don Diego announced the emperor's purpose of erecting a fortress in Siena to keep the citizens in order, the general hatred found vent in indignant remonstrance. The historian Orlando Malavolti and other special envoys were sent to the emperor in 1550 with a petition signed by more than a thousand citizens praying him to spare them so terrible a danger; but their mission failed: they returned unheard. Meanwhile Don Diego had laid the foundation of the citadel and was carrying on the work with activity. Thereupon certain Sienese citizens in Rome, headed by Æneas Piccolomini (a kinsman of Pius II.), entered into negotiations with the agents of the French king and, having with their help collected men and money, marched on Siena and forced their way in by the new gate (now Porta Romana) on 26th July 1552. The townspeople, encouraged and reinforced by this aid from without, at once rose in revolt, and, attacking the Spanish troops, disarmed them and drove them to take refuge in the citadel (28th July). And finally by an agreement with

Cosimo de' Medici, duke of Florence, the Spaniards were sent away on the 5th August 1552 and the Sienese took possession of their fortress.

Contest between empire and France for Siena. The Government was now reconstituted under the protection of the French agents; the *balia* was abolished, its very name having been rendered odious by the tyranny of Spain, and was replaced by a similar magistracy styled *capitani del popolo e reggimento*. Siena exulted in her recovered freedom; but her sunshine was soon clouded. First, the emperor's wrath was stirred by the influence of France in the counsels of the republic; then Cosimo, who was no less jealous of the French, conceived the design of annexing Siena to his own dominions. The first hostilities of the imperial forces in Val di Chiana (1552-53) did little damage; but when Cosimo took the field with an army commanded by the marquis of Marignano the ruin of Siena was at hand. On 26th January Marignano captured the forts of Porta Camollia (which the whole population of Siena, including the women, had helped to construct) and invested the city. On 2d August of the same year, at Marciano in Val di Chiana, he won a complete victory over the Sienese and French troops under Piero Strozzi, the Florentine exile and marshal of France. Meanwhile Siena was vigorously besieged, and its inhabitants, sacrificing everything for their beloved city, maintained a most heroic defence. A glorious record of their sufferings is to be found in the *Diary* of Sozzini, the Sienese historian, and in the *Commentaries* of Blaise de Monluc, the French representative in Siena. But in April 1555 the town was reduced to extremity and was forced to capitulate to the emperor and the duke. On 21st April the Spanish troops entered the gates; thereupon many patriots abandoned the city and, taking refuge at Montalcino, maintained there a shadowy form of republic until 1559.

Incorporation of Siena with Tuscany. Cosimo I de' Medici being granted the investiture of the Sienese state by the patent of Philip II of Spain, dated 3d July 1557, took formal possession of the city on the 19th of the same month. A lieutenant-general was appointed as representative of his authority; the council of the *balia* was reconstituted with twenty members chosen by the duke; the consistory and the general council were left in existence but deprived of their political autonomy. Thus Siena was annexed to the Florentine state under the same ruler and became an integral part of the grand-duchy of Tuscany. Nevertheless it retained a separate administration for more than two centuries, until the general reforms of the grand-duke Pietro Leopoldo, the French domination, and finally the restoration swept away all differences between the Sienese and Florentine systems of government. In 1859 Siena was the first Tuscan city that voted for annexation to Piedmont and the monarchy of Victor Emmanuel II, this decision (voted 26th June) being the initial step towards the unity of Italy.

Literary History.—The literary history of Siena, while recording no gifts to the world equal to those bequeathed by Florence, and without the power and originality by which the latter became the centre of Italian culture, can nevertheless boast of some illustrious names. Of these a brief summary, beginning with the department of general literature and passing on to history and science, is subjoined. Many of them are also dealt with in separate articles, to which the reader is referred.

Literary history. As early as the 13th century the vulgar tongue was already well established at Siena, being used in public documents, commercial records, and private correspondence. The poets flourishing at that period were Folcacchiero, Cecco Angiolieri—a humorist of a very high order—and Bindo Bonichi, who belonged also to the following century. The chief glory of the 14th century was St Catherine Benincasa. The year of her death (1380) was that of the birth of St Bernardino Albizzeschi, a popular preacher whose sermons in the vulgar tongue are models of style and diction. To the 15th century belongs Æneas Sylvius Piccolomini (Pius II), humanist, historian, and political writer. In the 16th century we find another Piccolomini (Alexander), bishop of Patras, author of a curious dialogue, *Della bella Creanza delle Donne*; another bishop, Claudio Tolomei, diplomatist, poet, and philologist, who revived the use of ancient Latin metres; and Luca Contile, a writer of narratives, plays, and poems. Prose fiction had two representatives in this century,—Scipione Bargagli, a writer of some merit, and Pietro Fortini, whose productions were trivial and indecent. In the 17th century we find Ludovico Sergardi (Quinto Settano), a Latinist and satirical writer of much talent and culture; but the most original and brilliant figure in Sienese literature is that of Girolamo Gigli (1660-1722), author of the *Gazzettino*, *La Sorellina di Don Pilone*, *Il Vocabolario Cateriniano*, and the *Diario Ecclesiastico*. As humorist, scholar, and philologist Gigli would take a high place in the literature of any land. His resolute opposition to all hypocrisy—whether religious or literary—exposed him to merciless persecution from the Jesuits and the Della Cruscan Academy.

Historians. In the domain of history we have first the old Sienese chronicles, which down to the 14th century are so confused that it is almost impossible to disentangle truth from fiction or even to decide the personality of the various authors. Three 14th century chronicles, attributed to Andrea Dei, Agnolo di Tura, called Il Grasso, and Neri di Donati, are published in Muratori, vol. xv. To the 15th century belongs the chronicle of Allegretto Allegretti, also in Muratori (vol. xxiii.), and during the same period flourished Sigismondo Tizio (a priest of Siena, though born at Castiglione Aretino), whose voluminous history written in Latin and never printed (now among the MSS. of the Chigi Library in Rome), though devoid of literary merit, contains much valuable material. The best Sienese historians belong to the 16th century. They are Orlando Malavolti (1515-1596), a man of noble birth, the most trustworthy of all; Antonio Bellarmati; Alessandro Sozzini di Girolamo, the sympathetic author of the *Diario dell' ultima Guerra Senese*; and Giugurta Tommasi, of whose tedious history ten books, down to 1354, have been published, the rest being still in manuscript. Together with these historians we must mention the learned scholars Celso Cittadini (d. 1627), Uberto Benvoglienti (d. 1733), one of Muratori's correspondents, and Gio. Antonio Pecci (d. 1768), author of histories of Pandolfo Petrucci and the bishopric of Siena. In the same category may be classed the librarian C. F. Carpellini (d. 1872), author of several monographs on the origin of Siena and the constitution of the republic, and Scipione Borghesi (d. 1877), who has left a precious store of historical, biographical, and bibliographical studies and documents.

Scientific writers. In theology and philosophy the most distinguished names are—Bernardino Ochino and Lelio and Fausto Soccini (16th century); in jurisprudence, three Soccini—Mariano senior, Bartolommeo, and Mariano junior (15th and 16th centuries); and in political economy, Sallustio Bandini (1677-1760), author of the *Discorso sulla Maremma*. In physical science the names most worthy of mention are those of the botanist Pier Antonio Mattioli (1501-1572), of Pirro Maria Gabrielli (1643-1705), founder of the academy of the Physiocritics, and of the anatomist Paolo Mascagni (d. 1825).

Painters. *Art.*—The history of Sienese art is a fair and luminous record. Lanzi happily designates Sienese painting as "Lieta scuola fra lieto popolo" ("the blithe school of a blithe people"). The special characteristics of its masters are freshness of colour, vivacity of expression, and distinct originality. The Sienese school of painting owes its origin to the influence of Byzantine art; but it improved that art, impressed it with a special stamp, and was for long independent of all other influences. Consequently Sienese art seemed almost stationary amid the general progress and development of the other Italian schools, and preserved its mediæval character down to the end of the 15th century. When the Florentine Giottesques and their few followers were on the wane, this mystic Sienese school still showed continued fertility and improvement. At the close of the 15th century the influence of the Umbrian and—to a slighter degree—of the Florentine schools began to penetrate into Siena, followed a little later by that of the Lombard; and these grafts gave fresh vigour to the old stock without destroying its special characteristics. Of this new phase of Sienese art it has been well said that Sodoma was its Leonardo, Baldassare Peruzzi its Raphael, and Beccafumi its Michelangelo. In every age Siena has produced many painters of different degrees of merit. It is impossible to mention all, so we will only cite the names of the more celebrated. In the 13th century we find Guido (da Siena), painter of the well-known Madonna in the church of S. Domenico in Siena. The 14th century gives us Ugolino, who painted the Madonna del Tabernacolo in Or San Michele, Florence; Duccio di Buoninsegna, whose chief work is the great panel of the high altar of the cathedral at Siena; Pietro and Ambrogio Lorenzetti, Simone di Martino (or Memmi), Lippo Memmi, Andrea di Vanni (painter and statesman), and Taddeo di Bartolo. In the 15th century we have Sano di Pietro, Giovanni di Paolo, Stefano di Giovanni (Il Sassetta), and Matteo di Giovanni Bartoli, whose several paintings of the Massacre of the Innocents show a fine sentiment and much observation of reality. The 16th century boasts the names of Guidoccio Cossarelli, Giacomo Pacchiarotto, Girolamo del Pacchia,

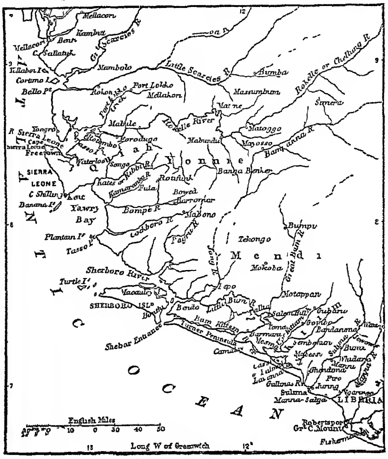
Baldassare Peruzzi (1481-1537), who was excellent in many branches of art and especially celebrated for his frescos and studies in perspective and chiaroscuro, Giovanni Antonio Bazzi, otherwise known as Il Sodoma (1477-1549), who, born at Vercelli in Piedmont and trained at Milan in the school of Leonardo da Vinci, came to Siena in 1504 and there produced his finest works, Domenico Beccafumi, otherwise known as Micharino (1486-1550), noted for the Michel angelesque daring of his designs, and Francesco Vanni

Sculptors and architects. Side by side with these painters marches a notable band of sculptors and architects, such as Lorenzo Maitani, architect of the Orvieto cathedral (end of 13th century), Camaino di Crescentino, Tino di Camaino, sculptor of the monument to Henry VII in the Campo Santo of Pisa, Agostino and Agnolo, who in 1330 carved the fine tomb of Bishop Guido Tarlati in the cathedral of Arezzo, Lando di Pietro (14th century), architect, entrusted by the Sienese commune with the proposed enlargement of the cathedral (1339), Giacomo della Quercia, whose lovely fountain, the Fonte Gaia, in the Piazza del Campo has been recently restored by the sculptor Sarrocchi, Lorenzo di Pietro (Il Vecchietta), a pupil of Della Quercia and an excellent artist in marble and bronze, Francesco di Giorgio Martino (1439-1502), painter, sculptor, military engineer, and writer on art, Giacomo Cozzarelli (15th century), and Lorenzo Mariano, surnamed Il Marrina (16th century) (C PA)

SIERADZ, a town of Russian Poland, in the government of Kalisz (Kalish), situated on the Warta, 127 miles south-west of Warsaw It is one of the oldest towns of Poland, founded prior to the introduction of Christianity, and was formerly known as Syra or Syraz The annals mention it in 1139 Several *seims* were held there during the 13th to 15th centuries, and it was a wealthy town until nearly destroyed by a fire in 1447 It is full of historical interest for the Poles The old castle, which suffered much in the Swedish war, was destroyed by the Germans in 1800 There are two churches dating from the 12th and 14th centuries Sieradz, after having been the chief town of a *voivódstvo*, has now no importance Its population was 15,040 in 1884.

SIERRA LEONE, a British colony on the West Coast of Africa, the capital of which, Freetown, lies in 8° 39′ N lat and 13° 14′ W long It consists of Sierra Leone proper, part of the Quiah country to the east, Tasso Island, &c, in the Sierra Leone estuary, part of the Bullom country to the north, the Los Islands to the north of the Mellicoury (Mellacorée) river, the Banana Islands to the south of the main settlement, Sherbro (Sherboro) Island and part of the Sherbro country, the Turner peninsula, W E Tucker's territory, and generally all the seaboard south to the mouth of the Manoh (Manna) river, which is now recognized as the northern boundary of Liberia The British territory and protectorate are estimated to have an area of about 3000 square miles, and, though it has not all been formally annexed, the whole coast region from the mouth of the Scarcies in 8° 55′ N lat to that of the Manoh in 6° 55′ may be considered as British, at least to the exclusion of any other European sovereignty

Sierra Leone proper is a peninsula about 18 miles long from north-west to south-east by about 12 broad It lies between the Sierra Leone estuary on the north and Yawry Bay on the south Lengthwise it is traversed by a range of high hills attaining a height of 3000 feet in the Sugar Loaf and nearly as much in Mount Horton farther south From the mainland the peninsula is physically separated by the Bance or Bunce river (properly estuary), which receives the Waterloo Creek and other small streams Towards the east and south-east the peninsula sinks to the level of the great alluvial zone which extends along the larger portion of this district of the African coast The hills seem to consist of some kind of igneous rock (popularly misnamed granite) and of beds of red sandstone, the disintegration of which has given a dark-coloured ferruginous soil of moderate fertility The "lofty green trees" which clothed the "mountain" at the time of its discovery (Cadamosto) have for the most part been destroyed, though Sugar Loaf is still timbered to the top and the peninsula is verdant with abundant vegetation The Negroes give so little attention to agriculture that the local produce would not feed the population for three



Map of Sierra Leone

months Among the productions of the peninsula are cola nuts, ginger (in large quantities), malagetta pepper, castor-oil, maize, cassava, ground nuts, and (in small quantities) cotton Native coffee was discovered in Quiah in 1796, and the growing of Liberian coffee and cocoa has since 1880 been attempted with some success

The rainfall of Sierra Leone, according to the Colonial Hospital observations at Freetown, is from 150 to 169 inches per annum The three months of January, February, and March are practically rainless, the rains, commencing in April or May, reach their maximum in July, August, and September, and rapidly diminish in October, November, and December It sometimes rains for thirty hours on end, but generally twelve hours of rain are followed by twenty-four, thirty, or more hours of clear and pleasant weather At the barracks (150 feet higher than the hospital) there are about 40 inches more rain, and at Kissy, 3 miles distant, some 18 or 20 inches less The annual temperature indoors is from 78° to 86° The highest reading for 1880 was 95° and the lowest 69° 33 During the dry season, when the climate is very much like that of the West Indies, there occur terrible tornadoes and long periods of the harmattan,—a north-east wind, dry and desiccating, and carrying with it those clouds of fine dust which the sailors designate "smokes" The dangers of the climate have long been exaggerated The low swampy regions are like those of other tropical countries, and Freetown, being badly placed and carelessly kept, is too often a hotbed of malaria and fever, but the higher districts are not the "white man's grave"

According to the census of 1880, the population of the colony was as follows —peninsula of Sierra Leone with British Quiah, 53,862, Isles de Los, 1371, occupiers of factories on the Sierra Leone river paying rent to Government, 52, island of Tasso, 828, British Sherbro (including Bonthe, Mocolo, Mokate, Runtch, York Island, Yelbana, Victoria, Tasso, Bendu, and Jamaica), 4333, — total 60,446 But the census officials deem the actual population to be much greater, that of British Sherbro, for example, being pretty certainly 8000 or 9000 Ethnographically Sierra Leone is almost "an epitome of Africa" The following are the more important races that can be distinctly classified —Mandingos, 1190, Timmanehs, 7443, Joloffs, 189, Baggas, 340, Mendis, 3088, Sherbros, 2882, Gallinas, 697, Limbas, 493, Susus (Soosoos), 1470, Fulahs, 225, Lokkos, 1454; Serrakulis, 129, Bulloms, 129, Krumen, 610 The direct descendants of the liberated slaves now number 35,430 The Akus or people of Yoruba and the Eboes from the eastern banks of the Niger are most easily distinguished The white residents number only 163, almost entirely a floating population

Most of the inhabitants depend upon trade, and are collected at the north end of the peninsula, in FREETOWN (*q v*) and the neighbouring villages Freetown has a good supply of pure water, and great improvements in sanitation have recently been effected Among the villages in the peninsula may be mentioned Kissy (founded in 1817), the seat of two hospitals for male and female incurables, Gloster (1816), Bathurst (1818), Leopold (1817), Charlotte (1818), Regent (1812), Leicester (1809)

According to the census returns of 1880, there were in Sierra Leone 18,660 Episcopalians, 17,098 Wesleyans and Methodists, 2717 of Lady Huntingdon's connexion, and 369 Roman Catholics Since 1861-62 there has been an independent Episcopal Native Church, but the Church Missionary Society, which in 1804 sent out the first missionaries to Sierra Leone and has spent about £500,000 on the colony, still maintains certain educative agencies Fourah Bay college, built by the society on the site of General Turner's estate (1½ miles east of Freetown) and opened in 1828 with six pupils, one of whom was Bishop Crowther, was affiliated in 1876 to Durham university, and has a high-class curriculum Other institutions are the grammar school (1846), the Wesleyan high school, and the Annie Walsh Memorial Female Institution

The following figures show the average value of the principal exports in recent years —

	Benni Seed	Cola Nuts	Ginger	Ground Nuts	Hides	Palm Kernels	Palm Oil.	Rubber	Gum Copal
	£	£	£	£	£	£	£	£	£
1877-81	6,847	23,731	11,989	30,808	12,607	116,822	35,869	41,941	12,671
1882	10,001	25,547	7,916	16,217	13,545	101,164	47,217	96,674	11,262
1883	9,721	31,661	13,409	11,282	12,326	81,578	21,954	89,782	14,780
1884	3,776	40,002	16,304	4,846	17,674	68,377	17,774	50,894	12,539

With the exception of the ginger, most of these products are brought down the rivers from the interior, and the development of trade has been grievously hampered by inter-tribal wars in non-British territory A considerable falling off is observable in those articles which require cultivation or labour, or are bulky in transit Cola nuts have steadily increased in quantity,—that part of the Limba country where they are principally grown being in comparative peace The supply of india-rubber has decreased, partly through destruction of the trees, partly through war in the Yonnie country Gum copal is brought from the northern rivers The Mendi country sends a good deal of rice, which is also grown largely in Sherbro The total value of all the exports was on an average for 1877-81 £382,620, and for 1882-83 £413,148 The corresponding figures for the imports were £424,447 and £429,273

The most northerly territory belonging to the colony is the little group of the Los Islands (Islas de los Idolos), about 80 miles north-north-west of Freetown to the south of Sangareah Bay Tamara or Futabar to the west and Factory Island to the east "enclose, like an atoll, an inner basin, in the centre of which lies the much smaller Crawford Island" The highest point is a knoll some 450 feet above sea-level in Tamara All these islands are richly clothed with palm trees and flowering underwood Factory Island is occupied by a French trading settlement At one time the islands were a great seat of the slave-trade and about 1812-13 were garrisoned by British troops for the suppression of the traffic The climate was then found to be exceedingly fatal

The small island of Matakong, 25 miles south-east, is also British On the mainland the watershed between the Great Scarcies and the Mellicoury (Mellacorée) has been adopted as the boundary between the French and English protectorates or annexation-areas The Great Scarcies river (Rio dos Carceres) appears to take its rise in the highlands of the Futa-Jallon not far from the sources of the Senegal, but its upper course has not been completely explored It is navigable for boats a long way inland, though the ascent from the sea is interrupted by rapids a short distance above Kambia, an important Mohammedan town The Little Scarcies has its headwaters to the north-east of Falaba, a town of the Sulima country, built in 1768 and visited by Laing (1822), Winwood Reade (1869), and Zweifel and Moustier (1879) The Rokelle or Mabilé river, which falls into the Sierra Leone estuary, is formed by the drainage of the Koranko country On a creek which reaches the estuary near the Rokelle mouth stands (at the head of navigation) the important township of Port Lokko, a mission station of the Church Missionary Society The maritime country between the Scarcies and Sierra Leone is called North Bullom (*i e*, low land), the tribe of the same name has been expelled from much of its territory by the Susus (whose country is the unexplored tract to the south of 11° N lat) and the Timmanehs (Timnis) At the angle of Yawry Bay lies the mouth of the Ribbi or Kates river, and about 10 miles farther south is the common outflow of the Kamaranka and the Bompé At the south side of the bay the small cluster of Plantain Islands corresponds to the Banana Islands on the north off Cape Shilling, which were ceded to the British in 1819 and are noted for their healthiness Southward opens the broad estuary of the Sherbro (popularly river), which lies between the island of Sherbro, annexed in 1862, and the territory of the same name The estuary receives the Bagru from the Manoh-Bagru country and the Jong river, whose headstream, the Bampinna, rises far inland in the same country as the Rokelle and has a breadth of 200 feet at Mayosso From the sea the Jong is navigable for steamers to Matonghbah (or Matubah) It is connected by the Little Bum Creek with the Great Bum river, which passes through the Mendi country and descends into the alluvial seaboard by rapids at Motappan The Bum loses itself in a curious network of lagoons and creeks separated from the ocean by the long low tract of Turner's peninsula The upper Kittam joins it from the east, and by another creek communicates with the Palma or Cassi Lake (20 miles long), which in its turn has a connexion with the Gallinas river (7° S lat) On the narrow strip of land between the ocean and the lake lies Lavanna, an important trading port, where a short line of railway has been laid down Parallel with the Gallinas flows the Moah or Sulimah river (falls at Whidaro), at the mouth of which is the town of Sulimah, and about 10 miles farther east is the Manoh river The countries inland between the Manoh and the Sulimah are Gbenma or Massaquoi, Soro, M'perri, Barrie, Cowrah, &c

History —Sierra Leone (in the original Portuguese form Sierra Leona) was known to its native inhabitants as Romarong or the Mountain, and received the current designation from the Portuguese discoverer Piedro de Cintra (1462) on account of the lion-like roaring of the thunder on its hill-tops An English fort was built on the Sierra Leone estuary towards the close of the 17th century, but was soon afterwards abandoned In 1786 Dr Smeathman proposed his scheme for founding on the peninsula a colony of liberated African slaves, and in 1787 Captain Thompson, having purchased the territory from Naimbana or King Tom of the Timmanehs, commenced the settlement with 400 Negroes and 60 Europeans Owing mainly to the utter shiftlessness of the settlers and partly to a hostile attack by a body of natives, this first attempt proved a complete failure In 1791 Falconbridge collected the surviving fugitives and laid out a new settlement (Granville's Town), and the promoters of the enterprise—Granville Sharp, William Wilberforce, William Ludlam, Sir Richard Carr Glynn, &c, hitherto known as the St George's Bay Company—obtained a charter incorporating them as the Sierra Leone Company (31 Geo III c 55) In 1792 Clarkson introduced into the colony 1200 Negroes from the Bahamas and Nova Scotia Afzelius the botanist and Nordenskjold the mineralogist were sent out to explore the capabilities of the country, but the latter soon after died at Port Lokko (Port Logo) In 1794 the settlement, which had been again transferred to Freetown, was plundered by the French An attempt to found a similar colony on Bulama (mouth of the Rio Grande) was a complete failure (Dalrymple and Beaver) In 1800 the company was allowed to make laws not repugnant to those of England, but in 1807 it was glad to transfer all its rights to the crown Sydney Smith's jest that Sierra Leone had always two governors, one just arrived in the colony and the other just arrived in England, is but a slight exaggeration There were eight changes between 1808 and 1824, and as many between 1865 and 1881 The names of Zachary Macaulay Sir Charles Macarthy, Sir Stephen J Hill, Sir Arthur Kennedy, Sir Samuel Rowe, and A E Havelock deserve to be mentioned In 1825 General Turner concluded a treaty placing Turner's peninsula, &c, under British protection, but effect was not given to it till 1881 In 1875 the mouths of the Kates, Kamaranka, Bompe, and Cockboro were annexed, and in 1883 the seaboard towards the Liberian frontier British influence has been peacefully advancing inland under Sir Samuel Rowe In 1866 Sierra Leone was made the seat of government of the new general government of the British settlements on the West Coast of Africa (comprising Sierra Leone, Gambia, the Gold Coast, and Lagos, each of which was to have a legislative council), but in 1874 the Gold Coast and Lagos were raised to a separate government, and the Gambia alone remains attached to Sierra Leone

SIEYÈS, EMMANUEL JOSEPH (1748-1836), one of the chief political thinkers and writers of the period of the French Revolution and the first empire, was born at Fréjus (Var) on 3d May 1748 He was destined for the church, was educated by the Jesuits, became a licentiate of the canon law, and, having early distinguished himself by the astuteness and originality of his ideas, was appointed vicar-general by the bishop of Chartres He shared the political fervour of the party of advance, and was fearlessly logical in working out the new and as yet indistinct princi-

ples of reform An excellent opportunity was provided for the inculcation of his views by the invitation which Necker addressed to all French writers to publish their opinions upon the mode of convening the states-general Sieyès startled his countrymen by the issue of various pamphlets upon the political situation, and particularly by his daring and original treatise upon the Third Estate, with its three famous divisions in question and answer —"1st, What is the Third Estate?—Everything What has it hitherto been in the political order?—Nothing What does it demand?—To become something" He attacked unsparingly the privileged classes, and indeed in this his most famous work he constructed, single-handed and at once, a programme for the Revolution The influence of the book and of its author soon became enormous, and in 1789 the Abbe Sieyès was elected by the city of Paris as a representative to the states-general, where he was the first to propose that the three estates should meet together in one assembly On the rejection of his motion he boldly suggested the formation of an "assembly of representatives of France already verified" He was not, however, successful as a speaker, his style being obscure and his matter too compressed for oral expression,—faults which disappeared when he committed his thoughts to writing Yet he was one of the leaders of the assembly, and was appointed a member of the committee on the constitution His published speech in opposition to the power of absolute veto by the king brought him still further into notice But he recognized his inaptitude for public speaking, and, although even Mirabeau declared that the silence of Sieyès was a public calamity, he stood aside while his own ideas were being developed amidst violence and riot both within and without the constituent and afterwards the legislative assembly As excess followed upon excess in the wild course of the Revolution Sieyès had neither the courage nor the power to quell the riot In danger of becoming a suspect, and fearful of his life, he emerged from obscurity in November 1793, on the occasion of the installation of Reason in Notre Dame Before the national convention he denied his faith, abjuring the title of priest, professing that his only worship was that of liberty and equality and his only religion the love of humanity and country, and concluding by formally renouncing to the state the commuted pension which he enjoyed in lieu of his former benefice The overthrow of the Jacobins at last overcame his fears and in March 1795 he is found publicly lauding the memory of those guillotined Girondists in whose defence he, two years before, had never once lifted his voice

In the same year (1795) the ex-abbé was commissioned by the Convention to The Hague, where he successfully concluded an offensive and defensive alliance between the United Provinces and France Without Sieyès no framing of a constitution could be attempted, and he was accordingly appointed member of a commission to draw up organic laws, the constitution of 1793 having been found unworkable When the commission brought forward its report Sieyès did not dissent, but he proposed to the Convention a separate scheme of his own, the specialty of which was the provision for the appointment of a constitutional jury which should be charged with the duty of revising all legislative decrees against which the challenge was brought that they were themselves at variance with the constitution His scheme was, however, rejected in favour of the new constitution, and from that moment he became its secret enemy He was elected one of the first directory of five, but he declined the honour In 1798 he was appointed the plenipotentiary of France to Prussia, where he was received with great honour and where he speedily began to plot against the Government he represented He communicated his views to Napoleon, then in Egypt Meanwhile (1799) he was again elected to the directory, and, his plans being ripe, he accepted office Then came the *coup d'état* of 18th Brumaire (9th November 1799), in which Sieyès took so important a part, but in which he was unquestionably overborne by the genius and audacity of Bonaparte The provisional consulate composed of Napoleon, Sieyès, and Ducos lasted but a few weeks After a little Sieyes is a count of the empire and the proprietor of Crosne (Seine-et-Oise), while Napoleon is able to boast of how he has bribed the ex-abbé out of his constitutional views Amid the political changes of France, Sieyès on the second return of the Bourbons fled to Brussels, but after the revolution of 1830 he felt it safe to return to Paris, where he died on 20th June 1836

SIGALON, XAVIER (1788-1837), French painter, born at Uzès (Gard) towards the close of 1788, was one of the few leaders of the romantic movement who cared for treatment of form rather than of colour The son of a poor rural schoolmaster, he had a terrible struggle before he was able even to reach Paris and obtain admission to Guérin's studio But the learning offered there did not respond to his special needs, and he tried to train himself by solitary study of the Italian masters in the gallery of the Louvre The Young Courtesan (Louvre), which he exhibited in 1822, at once attracted attention and was bought for the Luxembourg The painter, however, regarded it as but an essay in practice and sought to measure himself with a mightier motive, this he did in his Locusta (Nîmes), 1824, and again in Athaliah's Massacre (Nantes), 1827 Both these works showed incontestable power, but the Vision of St Jerome (Louvre), which appeared at the salon of 1831, together with the Crucifixion (Issengeaux), was by far the most individual of all his achievements, and that year he received the cross of the Legion of Honour The terrors and force of his pencil were not, however, rendered attractive by any charm of colour, his paintings remained unpurchased, and Sigalon found himself forced to get a humble living at times by painting portraits, when Thiers, then minister of the interior, recalled him to Paris and entrusted him with the task of copying the Sistine fresco of the Last Judgment for a hall in the Palace of the Fine Arts On the exhibition, in the Baths of Diocletian at Rome, of Sigalon's gigantic task, in which he had been aided by his pupil Numa Boucoiran, the artist was visited in state by Gregory XVI But Sigalon was not destined long to enjoy his tardy honours and the comparative ease procured by a small Government pension, returning to Rome to copy some pendants in the Sistine, he died there of cholera on 9th August 1837

SIGHTS A sight for shooting may be defined as an apparatus for determining the point of impact of a projectile, in popular language, for "aiming" or "laying" In its simplest form it is scarcely recognizable as a sight When an expert cricketer throws the ball straight to the wicket the eye and the hand assume that relative position which experience has taught to be correct, and the eye may be said to lay the hand on the wicket by means of the intervening muscles, which therefore constitute the sight The next step towards accuracy is seen in the ordinary shot-gun, where the eye is placed over and behind the centre of the breech, and sees that a bead placed above the centre of the muzzle is in a direct line with the desired point of impact If we add a notch at the centre of the breech to fix the eye more accurately, we shall have the hind-sight, the fore-sight, and the object brought into line, when the gun is correctly laid

This would constitute a perfect direct mechanical sight

if we could assume (1) that the projectile was not subject to gravity, (2) that it had no tendency to deviate if passing through a calm atmosphere, (3) that the object aimed at was stationary, (4) that the weapon discharged was stationary, (5) that the atmosphere was still

(1) The first condition is never realized the projectile begins to drop towards the earth the moment it leaves the gun, and therefore to make it strike at a given level its first direction must be above this level. Hence the hind-sight must be raised to make the necessary correction, and the angle between the axis of the piece and the straight line connecting the elevated hind-sight with the fore-sight and object is called the "angle of elevation" Supposing the projectile to move *in vacuo* and to drop simply under the action of gravity, the calculation of the amount of elevation to be given for any range at any velocity would be easily made, but the resistance of the air renders the problem an exceedingly complicated and difficult one (see GUNNERY), and only approximate solutions have as yet been discovered Next, supposing the hind-sight to be correctly elevated, it is evidently necessary to keep it upright, deviation to the right will cause the projectile to strike to the right of the object and deviation to the left to strike to the left of it The amount of error is given by the equation

$$d = r \tan \theta \tan \epsilon,$$

where d = error in direction, r = range, θ = angle made by plane of elevation with the perpendicular, and ϵ = angle of elevation The rifleman should study to keep the hind-sight as upright as possible, and indeed little error is likely to occur with a good shot from this cause But the case is very different with a gun mounted on an uneven or moving platform, and many devices have been resorted to for automatically overcoming the difficulty They all, however, belong to either the spirit-level or the pendulum type

(2) Secondly, the projectile deviates of its own accord from the vertical plane If it is unrifled, its imperfections of manufacture cause errors which may be in any direction, and which, therefore, cannot be compensated by any method of sighting If it is rifled, the spin given to it renders these imperfections of little consequence, but, on the other hand, confers a constant tendency to deviation If we lay a gun on the face of a clock, and the rifling causes a point on the surface of the shot to turn in the same direction as the hands, the shot will deviate to the right, contrariwise to the left The cause and extent of this motion have never been thoroughly worked out It appears to arise from the circumstance that the axis round which the shot rotates points always above the trajectory, since the principle of least resistance causes the direction of the axis to follow tardily the ever-changing curve, hence the pressure of the air, which of course acts in the direction of the trajectory, is greater on the lower than on the upper surface, and the unequal friction thereby set up causes the shot, as it were, to roll sideways, here also the principle of least resistance turns the axis slightly out of the vertical plane of fire towards the actual direction of the projectile The path is doubly curved,—first, downwards by gravity, secondly, sideways by the rotation, the latter curve, seen in plan, is nearly a parabola In order to correct this tendency of rifled projectiles to shoot round the corner, as it may be said, the hind-sight is inclined at an angle with the vertical, so that the more it is raised to give elevation the greater becomes the correction, which assumes the form of a curve not very dissimilar to that due to rotation The amount of error is practically determined on the firing ground, and the proper angle for the sight is given by the formula

$$\tan \theta = \frac{d}{r \sin \epsilon}$$

(3) Every one who shoots birds on the wing is acquainted with the difficulties appertaining to the non-fulfilment of the third condition The expert game-shot aims ahead of the object more or less, according to his judgment of the relative velocities of the projectile and the target and of the distance of the latter Practice makes this comparatively easy at the short ranges of ordinary sport, but in the case of a heavy fort gun firing at a vessel under full steam 3000 yards off, it becomes evident that considerable allowance must be made Put the mean horizontal velocity of the shot over a 3000 yards range at 1000 foot-seconds, the time of flight will be 9 seconds, if the ship is running past at the rate of 20 foot-seconds it will have traversed 180 feet during the shot's flight, and it will be necessary to direct the gun so much ahead of the desired point of impact The angle of divergence in the case just given is $\tan^{-1} 02$, and, supposing the horizontal velocity of the projectile to be constant throughout its flight, this angle would be correct for a ship running at a speed of 20 foot-seconds whatever the range

(4) The fourth condition is rarely met with except on board ship, and it is evident that it obeys the same laws and is subject to the same kind of correction as the third The correcting angle, however, is here given by the ship's speed across the line of fire and the starting velocity of the projectile

(5) The fifth source of error differs from the others in being variable and uncontrollable A gust of wind may spoil the best shot, and, though it is possible in practice to allow for deviation due to a steady breeze, yet the force and even the direction of the moving air differ so frequently at different parts of the trajectory that it has hitherto been found impossible to devise any satisfactory correction beyond that obtainable from knowledge of the point of impact of a previous shot The effect of wind on direction may be calculated from the formula

$$D = Wt \sin \phi - 990 \frac{w}{Ag} \log \left\{ \frac{Ag\,Wt \sin \phi}{500\,w} + 1 \right\},$$

where D = deflexion in feet, W = velocity of wind in feet per second, t = time of flight in seconds, ϕ = angle between direction of wind and line of fire, A = area of longitudinal section of shot in square feet, w = weight of shot in pounds, g = force of gravity This formula assumes that the wind steadily carries the shot sideways without changing the parallelism of its axis, an assumption not greatly in error with heavy projectiles having the centre of gravity nearly coincident with the centre of figure The effect of wind on range may be arrived at by adding or subtracting the velocity of the air, resolved in the direction of the object, to or from the horizontal velocity of the projectile and calculating by the tables (see GUNNERY) the loss or gain due to the increased or diminished resistance

The accompanying diagrams (figs 1, 2) represent what are called "speed-sights" in the royal navy, as applied to a 4-inch breech-loading gun The gun is shown elevated at 8° for a range of 4600 yards The hind or "tangent" sight is sloped sideways at an angle of 1° 30′ to correct the constant tendency of the projectile to deviate to the right The sight is raised in the socket till the lowest visible graduation on the bar reads the required range on the face towards the breech and the elevation in degrees on the face towards the muzzle A crosshead carries a leaf, which is traversed to the right or left by a double threaded screw, this leaf is provided with a fine wire strung horizontally between two uprights, hence this form of sight is sometimes known as the H sight The crosshead is graduated with two scales, one on the muzzle-face reading minutes of deflexion for giving any desired correction for wind or uneven platform, the other on the breech-face for allowing for the speed of the enemy in knots across the line of fire The fore-sight is fixed in the gun, and cannot be raised or lowered It has a crosshead provided with a traversing leaf, which carries a round bead on a thin support The crosshead is graduated to allow for the speed of the firing vessel across the line of fire In practice the gunner makes all these adjustments as nearly as he can judge, then takes up his

position about 4 feet behind the breech of the gun, holding the firing lanyard taut, when the object and the bead of the fore-sight appear to be on the centre of the wire across the H of the hind-sight he fires

The forms of sights preferred by experts for accurate laying are extremely varied, and nothing but practice can determine the most suitable to individual eyesight Where the eye can be brought close to the hind-sight, one of the best systems is that adopted for British field-guns, where a fine peep-hole constitutes the hind-sight, and the fore-sight consists of diagonal cross-wires, the first rapid or rough adjustment of the gun is made with the aid of a V-shaped notch on the hind-sight and an acorn point on the fore-sight Some prefer pointers for the fore-sight, either O-shaped, so that the object appears between the cusps of the O—this is the French method—or placed diagonally like cross-wires with the intersection removed Silvered vertical lines are preferred by many good shots If the gun is mounted in a fixed position, say on a siege platform, and, if the relative positions of the target and some other object are known, it may be found convenient to lay the gun on the target by directing the sights at the other object This is principally done in the case of howitzers dropping shells at high elevation into a work They fire over a protecting bank and are laid by reversed sights from the muzzle backwards at a steeple, a pole, or other convenient object

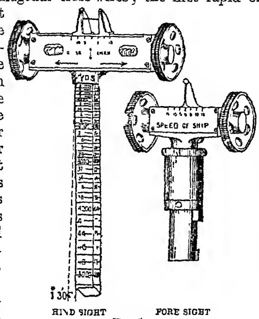

Fig 1

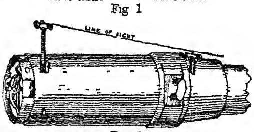

Fig 2
Speed-sights used in the British navy

To secure greater accuracy than can be attained by the eye, telescopes are resorted to It is obviously easy to apply to a match rifle a telescope with sufficient strength to resist the jar of firing, and to provide it with the necessary fittings for elevation, deflexion, &c, but with ordnance the shock is much greater, and the telescope has to be removed before firing This renders it difficult to secure a truly accurate attachment, but probably the immediate future will witness a sufficiently satisfactory solution of the problem as regards guns on firm platforms Efforts have been made from time to time to overcome the necessity for extreme accuracy due to the short bearing of the telescope by bringing the fore-sight into play, this can be done either by great powers of adjustment of focus, so as to view first the fore-sight and then the target, or by adding a half-object lens, and so getting simultaneous images of fore-sight and target

The application of electricity to the laying and firing of heavy guns has caused a remarkable development of the systems of sighting introduced recently into the forts which protect the shores of the United Kingdom Suppose a battery of guns to command a channel, and that it is desired to concentrate their fire on a hostile vessel endeavouring to run past Each detachment lays its gun both for elevation and direction in accordance with the figures which appear on a dial in the emplacement Each dial is worked by electricity from an observing station away from the smoke and noise of the fort, as the hostile vessel approaches the observing officer follows its course on a chart The observing station is placed at a considerable height above the water-line, so that a vertical base of calculation is obtained Hence the angle of depression given by the telescope when pointing at the object indicates the range, and the direction of the telescope indicates the line of fire, these indications are automatically corrected for the positions of the guns In practice the officer follows the ship's course, signals to the battery the line and distance of a point a little ahead of the vessel, and receives a signal from the battery that the guns are laid and ready He then fires electrically as the ship is coming into the expected position (E M)

SIGISMUND (1362-1437), German emperor, was born on 14th February 1362 After the death of his father, the emperor Charles IV, he received the margraviate of Brandenburg, and his betrothal with Mary, the daughter and heiress of Louis of Poland and Hungary, gave him a right to look forward to the succession in these two countries But in 1383, when Louis died, the Poles chose Hedwig, Mary's sister, as their queen, and Sigismund was unable to marry Mary and to secure the crown of Hungary until 1387, as her rights had been seized by Charles of Durazzo, and after his death she had been made prisoner by the ban of Croatia Sigismund was soon involved in a war with the Turks, and in order to obtain the means of carrying on the struggle he gave Brandenburg in pledge to his cousin Jobst of Moravia Defeated at Nicopolis in 1396, Sigismund fled to Greece, and in his absence his wife died When he returned to Hungary the people rose against him, made him prisoner, and gave the crown to Ladislaus of Naples Sigismund escaped, and having sold the Altmark, which he had inherited from his brother John, he was able to collect an army and to crush the Hungarian rebellion Meanwhile his brother Wenceslaus, king of the Romans, had been deposed, and Rupert of the Palatinate was chosen as his successor In 1410 Rupert died, and Sigismund and Jobst of Moravia were both elected to the crown Jobst died in the following year, and then Sigismund was universally recognized as king One of the chief events of his reign was the assembling of the council of Constance, which met for the purpose of bringing the great schism in the church to an end Sigismund marred his services in connexion with the council by assenting to the burning of John Hus, to whom he had granted a safe conduct For this treachery he had to pay a heavy penalty, for it led indirectly to the Husite War, which raged for about sixteen years In 1435 peace was restored, and Sigismund obtained possession of Bohemia In 1415 he gave Brandenburg, which had been restored to him after Jobst's death, in fief to Frederick, burgrave of Nuremberg, and in 1423, in reward for services rendered in the Husite War, Frederick, margrave of Meissen, received the duchy of Saxony with the electoral dignity Sigismund was crowned emperor in 1433, having obtained the Italian crown two years before He died at Znaim in Moravia on 9th December 1437 He possessed considerable intellectual ability, but he never did full justice to his powers,—being recklessly extravagant and of a wayward and impulsive temper

SIGISMUND, the name of three kings of Poland See Poland, vol xix pp 290-291 and 294

SIGMARINGEN, the seat of government of the Prussian administrative division of the same name, is a small town

on the Danube with (1880) 4154 inhabitants The division of Sigmaringen is composed of the two formerly sovereign principalities of Hohenzollern-Sigmaringen and Hohenzollern-Hechingen (see HOHENZOLLERN, vol XII p 52) and has an area of 440 square miles, with a population in 1880 of 67,624 The Sigmaringen part of the Hohenzollern lands was the larger of the two (297 square miles) and lay mainly to the south of Hechingen, though the district of Haigerloch on the Neckar also belonged to it The name of Hohenzollern is used much more frequently than the official Sigmaringen to designate the combined principalities

SIGNALS, NAVAL A system of naval signals comprises different methods of conveying orders or information to or from a ship in sight and within hearing, but at a distance too great to permit of hailing,—in other words, beyond the reach of the voice, even when aided by the speaking-trumpet Signals are divided into classes according to the instruments with which and the circumstances under which they are made There are sight and sound signals, flag, semaphore, fixed lantern, flashing, firework, horn or steam-whistle, and gun signals, day, night, fog, and distant signals Besides these, there are other divisions, such as general, vocabulary, evolutionary, &c, which depend upon technical considerations and are matters of arrangement

The necessity of some plan of rapidly conveying orders or intelligence to a distance was early recognized Polybius describes two methods, one proposed by Æneas Tacitus more than three centuries before Christ, and one perfected by himself, which, as any word could be spelled by it, anticipated the underlying principle of recent systems The signal codes of the ancients are believed to have been elaborate Generally some kind of flag was used Shields were also displayed in a preconcerted manner, and some have imagined that the reflected rays of the sun were flashed from them as with the modern heliograph (see HELIOGRAPHY) In the Middle Ages flags, banners, and lanterns were used to distinguish particular squadrons, and as marks of rank, as they are at present, also to call officers to the admiral, and to report sighting the enemy and getting into danger. The invention of cannon made an important addition to the means of signalling In the instructions issued by Don Martin de Padilla in 1597 the use of guns, lights, and fires is mentioned The introduction of the square rig permitted a further addition, that of letting fall a sail a certain number of times Before the middle of the 17th century only a few stated orders and reports could be made known by signalling Flags were used by day, and lights, occasionally with guns, at night The signification then, and for a long time after, depended upon the position in which the light or flag was displayed Orders, indeed, were as often as possible communicated by hailing or even by means of boats As the size of ships increased the inconvenience of both plans became intolerable Some attribute the first attempt at a regular code to Admiral Penn, but the credit of it is usually given to James II when duke of York Notwithstanding the attention paid to the subject by Paul Hoste and others, signals continued strangely imperfect till late in the 18th century Towards 1780 Admiral Kempenfelt devised a plan of flag-signalling which was the parent of that now in use Instead of indicating differences of meaning by varying the position of a solitary flag, he combined distinct flags in pairs About the beginning of the 19th century Sir Home Popham improved a method of conveying messages by flags proposed by Mr Hall Gower, and greatly increased a ship's power of communicating with others The number of night and fog signals that could be shown was still very restricted In 1867 an innovation of prodigious importance was made by the adoption in the British navy of Captain Philip Colomb's flashing system, on which he had been at work since 1858 This is in general use in all fleets, though, oddly enough, on its first trial at sea it was condemned It is not too much to say that the Colomb system has made it possible to handle, with confidence and safety, in darkness and fog, squadrons composed of the gigantic armour-clads of the day Its adoption has not only contributed very materially to the increased efficiency of the British fleets but also immensely reduced the risk of accidents, and the saving to the tax-payer since its introduction may probably be estimated in hundreds of thousands of pounds

In the British navy, which is copied by most others, sight-signals are made with flags, the semaphore, "flashes," fixed lanterns, and occasionally with fireworks, and for "distant" signals with flags, balls, and pendants displayed on account of shape but not of colour Sound-signals are made with horns, steam-whistles, and guns There are two sets of flags,—one of ten numbered from 1 to 10, and another of twenty-one called after letters of the alphabet There are also pendants and a few special flags The numbered flags are used with the general signal book, a kind of dictionary in which figures stand opposite sentences conveying orders or announcements Opposite 123 might stand "hoist in all boats," which would mean that, when the flag called 1 was hoisted with 2 beneath it and 3 beneath 2, the ship or ships addressed—indicated by a special flag or by pendants—were ordered to hoist all boats in The lettered flags are used with the vocabulary signal book, in which opposite collections of letters are put single words or small groups of words Thus, if ABC were opposite the word "admiral" and STO opposite "will sail at noon," when the first three flags were hoisted the signalman on board each ship addressed would note them down with their signification When all addressed had acknowledged the first "hoist" the flags would be hauled down and STO would be hoisted, to be acknowledged and noted in like manner The admiral would thus have made known his intention of sailing at a given hour From this it will appear that the general code is used for words of command and the vocabulary for long communications The night signal book contains a limited number of definite orders and announcements made known by exhibiting lanterns, never more than four, arranged vertically, horizontally, or in a square For a few signals some kind of firework is displayed Fog-signals are made by firing different numbers of guns at fixed intervals Owing to the slowness of flag-signalling, it is now, especially for the vocabulary and at moderate distances, largely superseded by the semaphore, an upright post with two arms moving in a vertical plane The changed positions of the arms indicate letters and each word is spelled Before the adoption of Captain Colomb's system, at night and in fogs only a few announcements could be made by signal, and sending messages was unknown By a series of symbols formed of dots and short lines, like those of the Morse alphabet, he represents figures, letters, and special words. Thus means 3, and — 7 The system can be employed in daylight, at night, and in fogs In daylight long and short waves of a flag on a staff reproduce the flashes, in fogs long and short blasts on a fog-horn or steam-whistle, and at night the alternate exposure and concealment of the light of a lamp. Every order in the general signal book and every word in the vocabulary—by spelling, indeed, every word in the language—may be communicated by this system Distant signals, now rarely used, are made by hoisting flags of different shapes at distances at which colours become invisible. The *Army and Navy Signal Book* contains the

code for communications between a ship and its boats or military stations on shore; the *International*, with special flags, is for communicating with merchant vessels. In the British navy there is a corps of signalmen rising in grade from boys to chief petty officers. They are selected from the most intelligent and best educated boys in the training-ships, and go through a course of special instruction in their duties. (C. A. G. B.)

SIGNORELLI, LUCA (c. 1442-c. 1524), one of the greatest of the Italian painters who ushered in the full culmination of the art under Leonardo da Vinci, Michelangelo, and Raphael, was born in Cortona—his full name being Luca d'Egidio di Ventura; he has also been called Luca da Cortona. The precise date of his birth is uncertain; but, as he is said to have died at the age of eighty-two, and as he was certainly alive during some part of 1524, the birth-date of 1442 must be nearly correct. He belongs to the Tuscan school, associated with that of Umbria. His first impressions of art seem to be due to Perugia,—the style of Bonfigli, Fiorenzo, and Pinturicchio. Lazzaro Vasari, the great-grandfather of Giorgio Vasari, the historian of art, was brother to Luca's mother; he got Luca apprenticed to Piero della Francesca. In 1472 the young man was painting at Arezzo, and in 1474 at Città di Castello. He presented to Lorenzo de' Medici a picture which is probably the one named the School of Pan, discovered some years ago in Florence, and now belonging to Marquis Corsi; it is almost the same subject which he painted also on the wall of the Petrucci palace in Siena,—the principal figures being Pan himself, Olympus, Echo, a man reclining on the ground, and two listening shepherds (see SCHOOLS OF PAINTING, vol. xxi. p. 434, fig. 8). He executed, moreover, various sacred pictures, showing a study of Botticelli and Lippo Lippi. Pope Sixtus IV. commissioned Signorelli to paint some frescos, now mostly very dim, in the shrine of Loreto,—Angels, Doctors of the Church, Evangelists, Apostles, the Incredulity of Thomas, and the Conversion of St Paul. He also executed a single fresco in the Sistine Chapel in Rome, the Acts of Moses; another, Moses and Zipporah, which has been usually ascribed to Signorelli, is now recognized as the work of Perugino. Luca may have stayed in Rome from 1478 to 1484. In the latter year he returned to his native Cortona, which remained from this time his ordinary home. From 1497 he began some professional excursions. In Siena, in the convent of Chiusuri, he painted eight frescos, forming part of a vast series of the Life of St Benedict; they are at present much injured. In the palace of Pandolfo Petrucci he worked upon various classic or mythological subjects, including the School of Pan already mentioned. From Siena he went to Orvieto, and here he produced the works which, beyond all others, stamp his greatness in art. These are the frescos in the chapel of S. Brizio, in the cathedral, which already contained some pictures on the vaulting by Fra Angelico. The works of Signorelli represent the Last Days of the Mundane Dispensation, with the Pomp and the Fall of Antichrist, and the Eternal Destiny of Man, and occupy three vast lunettes, each of them a single picture. In one of them, Antichrist, after his portents and impious glories, falls headlong from the sky, crashing down into an innumerable crowd of men and women. Paradise, the Elect and the Condemned, Hell, the Resurrection of the Dead, and the Destruction of the Reprobate follow in other compartments. To Angelico's ceiling Signorelli added a section showing figures blowing trumpets, &c.; and in another ceiling he depicted the Madonna, Doctors of the Church, Patriarchs, and Martyrs. There is also a great deal of subsidiary work connected with Dante, and with the poets and legends of antiquity. The daring and terrible invention of the great compositions, with their powerful treatment of the nude and of the most arduous foreshortenings, and the general mastery over complex grouping and distribution, marked a development of art which had never previously been attained. It has been said that Michelangelo felt so strongly the might of Signorelli's delineations that he borrowed, in his own Last Judgment, some of the figures or combinations which he found at Orvieto; this statement, however, has not been verified by precise instances. The contract for Luca's work is still on record. He undertook on 5th April 1499 to complete the ceiling for 200 ducats, and to paint the walls for 600, along with lodging, and in every month two measures of wine and two quarters of corn. Signorelli's first stay in Orvieto lasted not more than two years. In 1502 he returned to Cortona, and painted a dead Christ, with the Marys and other figures. Two years later he was once more back in Orvieto, and completed the whole of his work in or about that time, *i.e.*, some two years before 1506,—a date famous in the history of the advance of art, when Michelangelo displayed his cartoon of Pisa.

After finishing off at Orvieto, Signorelli was much in Siena. In 1507 he executed a great altarpiece for S. Medardo at Arcevia in Umbria—the Madonna and Child, with the Massacre of the Innocents and other episodes. In 1508 Pope Julius II. determined to re-adorn the camere of the Vatican, and he summoned to Rome Signorelli, in company with Perugino, Pinturicchio, and Bazzi (Sodoma). They began operations, but were shortly all superseded to make way for Raphael, and their work was taken down. Luca now returned to Siena, living afterwards for the most part in Cortona. He continued constantly at work, but the performances of his closing years were not of special mark. In 1520 he went with one of his pictures to Arezzo. Here he saw Giorgio Vasari, aged eight, and encouraged his father to second the boy's bent for art. Vasari tells a pretty story how the wellnigh octogenarian master said to him "Impara, parentino" ("You must study, my little kinsman"), and clasped a jasper round his neck as a preservative against nose-bleeding, to which the child was subject. He was partially paralytic when he began a fresco of the Baptism of Christ in the chapel of Cardinal Passerini's palace near Cortona, which is the last picture of his that we find specified. Signorelli stood in great repute not only as a painter but also as a citizen. He entered the magistracy of Cortona as early as 1488, and in 1524 held a leading position among the magistrates of his native place. In or about the year 1524 he died there.

Signorelli from an early age paid great attention to anatomy, carrying on his studies in burial grounds. He surpassed all his contemporaries in showing the structure and mechanism of the nude in immediate action; and he even went beyond nature in experiments of this kind, trying hypothetical attitudes and combinations. His drawings in the Louvre demonstrate this and bear a close analogy to the method of Michelangelo. He aimed at powerful truth rather than nobility of form; colour was comparatively neglected, and his chiaroscuro exhibits sharp oppositions of lights and shadows. He had a vast influence over the painters of his own and of succeeding times, but had no pupils or assistants of high mark; one of them was a nephew named Francesco. He was a married man with a family; one of his sons died, seemingly through some sudden casualty, and Luca depicted the corpse with sorrowful but steady self-possession. He is described as full of kindliness and amiability, sincere, courteous, easy with his art assistants, of fine manners, living and dressing well; indeed, according to Vasari, he always lived more like a nobleman than a painter. The Torrigiani Gallery in Florence contains a grand life-sized portrait by Signorelli of a man in a red cap and vest; this is said to be the likeness of the painter himself, and corresponds with Vasari's observation. The pictorial reputation of Signorelli has revived and ripened very much throughout Europe in recent years. The foregoing account of him is principally founded upon that given by Messrs Crowe and Cavalcaselle. In Great Britain there is no better specimen of his work than the Circumcision of Jesus, a panel lately in Hamilton Palace, near Glasgow. (W. M. R.)

SIKHS See INDIA vol xii p 808, and PUNJAB, vol xx p 110, also HINDUSTANI, vol xi. p 844

SIKKIM, a native state of India, in the eastern Himalaya Mountains, between 27° 9′ and 27° 58′ N lat and between 88° 4′ and 89° E long, and bounded on the north and north-east by Tibet, on the south-east by Bhutan, on the south by the British district of Darjiling, and on the west by Nepal It covers an area of 2600 square miles, with an estimated population of 7000 The Tibetan name for Sikkim is Dingjing or Demo-jong, and for the people Deunjong Maro, the Gurkhas call them Lepchas, but Mr Clements Markham, in his work on Tibet (1879), says that their proper name is Rong The whole of the state is situated at a considerable elevation within the Himalayan mountain zone From the level of the sea to an elevation of 12,000 feet, Sikkim is covered with dense forests of tall umbrageous trees The mountains in the south are generally lower than those of Darjiling district, but north of Tumlung the passes are of great height Jelap-la, the most southerly of these, rises to 13,000 feet, the two next are the Guratu-la and Yak-la, leading into the Chumbi valley of Tibet, the latter being 14,000 feet high, further north are the Cho-la (15,000 feet), on the direct road from Tumlung to Chumbi, and the Tankra-la (16,083 feet), the most snowy pass in Sikkim The state is drained by the Tista and its affluents, and by the Am-machu which rises near Parijong, at the foot of the Chamalhari peak (23,929 feet), and flows through the Chumbi valley into the district of Jalpaiguri under the name of the Torsha Through Sikkim lie the most promising routes for trade with Tibet At present, however, the Tibetan passes are closed to ordinary British subjects, though an active trade is maintained in certain articles by Bhuteas and Tibetans

The capital of Sikkim is Tumlung, where the raja resides during the winter and spring, usually going to his estates at Chumbi in Tibet in summer, in order to avoid the heavy rains The raja receives a subsidiary allowance of £1200 a year from the British Government, in consideration of his position as former ruler of the hill territory of Darjiling and a submontane tract on the plain called the Morung Communication with the state is kept up through the deputy commissioner of Darjiling Sikkim produces rice, Indian corn, millet, oranges, and two or three sorts of Lepcha cloth Its mineral products are lime and copper

SILENUS, a personage of Greek mythology, a drunken attendant of Bacchus and closely allied to the satyrs, of whom he appears as the leader. Elderly satyrs were called Sileni The Sileni belong especially to the legends of Asia Minor, and particularly of Lydia and Phrygia The stories as to the birth of Silenus were various Some called him a son of Hermes, others of Pan and a nymph, others said that he sprang from the drops of the blood of Sky Sometimes he figures as the guardian of Dionysus In spite of his dissipated habits he possessed a large stock of general information, which however, like Proteus, he only imparted on compulsion Midas, king of Phrygia, caught him by mixing wine in the spring out of which Silenus, in a moment of weakness, had condescended to drink The conversation which followed is fully reported by Theopompus and Aristotle (Ælian, *Var Hist*, iii 18, Plutarch, *Consol ad Apoll*, 27) Prefacing his remarks with a slight sketch of terrestrial geography and a brief reference to the fauna characteristic of the different continents, Silenus proceeded to draw an edifying picture of the pleasures of true piety as contrasted with the dreadful fate in store for the wicked, winding up with a gloomy reflexion on the vanity of human life and the expression of a wish that he had never been born Another of his homilies has been preserved by Virgil (*Ecl*, 6) two shepherds surprise the sage drunk in a cave, they bind him with flowery chains, and he tells them how the world was made, with stories "of remotest eld." Apart from this gift of sermonizing, the Sileni seem to have resembled the satyrs in their love of music, wine, and women Indeed, the Greeks appear not to have sharply distinguished between them, for Marsyas, the mythical flute-player, is called sometimes a satyr, sometimes a Silenus In art Silenus appears as a fat, dumpy old man, with a snub nose and a bald head, riding on an ass and supported by satyrs who keep the jolly toper from tumbling off Or he is depicted standing or lying with his inseparable companion, a wine-skin, which again he sometimes bestrides Sometimes he is sitting with his Pan's-pipe or flute in his hand

SILESIA (Germ *Schlesien*), a district in the eastern part of Germany, between 49° 28′ and 52° 7′ N. lat and 13° 50′ and 19° 20′ E long, was formerly united with the kingdom of Bohemia in the form of a duchy (or rather group of duchies), and is now unequally shared between Prussia and Austria Geographically it is divided into Lower and Upper Silesia, the whole of the former and part of the latter belonging to Prussia The total area is 17,540 square miles

It is generally asserted that the original inhabitants of Silesia were the Germanic tribes of the Lygii and Quadi, who retired before the Slavonic immigrations of the 6th century, but this statement is beyond the range of positive proof The earliest form of the name, Sleenzane or Zlesane, shows a Slavonic origin, and further than this we have no means of penetrating Various explanations have been given of the name, and one old writer gravely connects it with the prophet Elisha, but there is little doubt that it was first applied to the district round Mount Zlenz (the modern Zobten) and the river Zlenza (Lohe), and thence spread gradually over the whole region now known as Silesia These early Slavonic inhabitants belonged to the family of Lechs (Poles), and the modern Polish name for the inhabitants is Zlesaki The history of Silesia consists substantially of the process which has converted it from a Slavonic territory into a predominantly German land

The earliest notices of Silesia are extremely vague, nor can we exactly define the scope of the name in the first thousand years of our era It seems to have formed part of the great but short-lived kingdom of MORAVIA (*q v*) in the 9th century, and afterwards oscillated between the neighbouring kingdoms of Bohemia and Poland, becoming definitely incorporated with the latter at the end of the 10th century Christianity was introduced about the year 960, and from 1000 on we have an unbroken list of bishops of Breslau The first contact of Germany with Silesia was disastrous to the former, as it was on the fastnesses of Silesia that Henry V squandered his strength in his unsuccessful expedition against Poland in 1109 More fortunate was the intervention of Frederick Barbarossa in 1163 in behalf of the three sons of the dispossessed Ladislaus, a member of the Polish royal family of the Piasts He succeeded in securing as their share of the Polish dominions the whole of Silesia, though it was not till forty or fifty years later that it could be said to have gained actual independence of Poland These three princes were the ancestors and founders of the various ducal lines that henceforth ruled in Silesia, and their intimate connexion with the German king accounts in great measure for the process of Germanization which Silesia now began to undergo, chiefly through the introduction of German colonists in scantily peopled or desolated districts The eldest of the three sons of Ladislaus received the town of Breslau and by far the largest portion of territory, so that the history of Silesia for the next two or three generations is practically that of his line Under his grandson Henry the Bearded (1202–1238) the Germanization of Silesia made rapid pro-

gress, and the duchy at that time may be looked upon as a bulwark or mark against the Slavs in the south-east of Germany, just as the duchy of Prussia was in the north-east. Henry extended his sway much beyond the limits of Silesia, and in fact united under his sceptre nearly three quarters of the old Polish dominions. His son Henry II (1238–1241) had a short reign with a glorious end, falling in 1241 at the battle of Liegnitz, where his determined resistance turned back from Germany the alarming Mongolian invasion. On his death his territories were shared among his sons, and the series of divisions and subdivisions began which resulted in almost every Silesian town of any importance becoming the capital of an independent prince. At the beginning of the 14th century there were no fewer than 17 principalities of this kind, nearly all held by dukes of the Piast family. It was inevitable that these petty rulers should feel the want of a support against the encroachments of Poland, and it was inevitable, too, that the relation opened in consequence with Bohemia should gradually change from mere protection to feudal supremacy. By 1355 the supremacy of Bohemia was formally recognized as extending over the whole of Silesia, though the Silesians retained a considerable measure of independence, including the right to hold general diets for the settlement of their internal relations. The kings of Bohemia at this time (John, Charles IV) were members of the German house of Luxemburg, and Silesia under their sway may be looked upon as an entirely German land.

During the Hussite wars of the 15th century Silesia, which adhered zealously to the old faith, suffered greatly from Hussite forays. The Luxemburg dominion broke up in 1458, when Hungary and Bohemia elected rulers of their own nationality. Silesia, however, neglected the opportunity to elect a German king for itself, and supported the Bohemian king George Podiebrad. Breslau, still the most powerful of the principalities, threw in its lot with Matthew Corvinus of Hungary, who fought many of his battles on Silesian soil. By the treaty of Olmutz in 1479 Matthew acquired all the tributary lands of the Bohemian crown, including Silesia, which remained attached to Hungary down to 1490. In that year Bohemia and Hungary became once more united under the same king. In 1526 Silesia passed with the rest of the Bohemian inheritance to the house of Hapsburg (see BOHEMIA). The Reformation at first made rapid progress in Silesia, and the native dukes placed little opposition in its way. The Hapsburg princes, however, acted very differently, and the Silesian Protestants suffered much persecution before, during, and after the Thirty Years' War. It was not indeed till the 18th century that they acquired formal recognition and the restoration of some of their confiscated churches.

The First Silesian War between Austria and Prussia, which broke out in 1740, had its ultimate cause (nominally at least) in a compact of mutual succession entered into in 1537 by the elector of Brandenburg on the one side and the duke of Liegnitz on the other. The emperor, as feudal superior of the duke, had indeed refused to recognize this agreement, but the Great Elector did not fail to put in his claim on the death of the last duke in 1675, and Frederick now thought the opportunity too good to be lost. The progress of the three Silesian wars is recounted in the article AUSTRIA (vol. iii. p. 127–129). At the peace of Hubertusburg (1763) Prussia was left in possession of nearly the whole of Silesia, with the frontier as it still exists. Frederick exerted himself to atone for the evils brought upon the district through the ravages of war by introducing colonists and capital, reforming the administration, granting complete religious liberty, and the like. That this seed did not fall on ungrateful soil seems proved by the modern prosperity of Silesia and the loyalty with which its inhabitants have clung to the Prussian cause. Silesia formed part of the reduced kingdom of Prussia left by the peace of Tilsit in 1806, and it was the centre of the national rising of 1813, when the king issued his celebrated address "To my People" from Breslau. Stein's emancipating edict of 1807 was welcomed with profound satisfaction in Silesia, where the conditions of serfdom had been particularly oppressive, and no doubt contributed materially to the enthusiasm with which the Silesians flocked to the standard a few years later.[1]

PRUSSIAN SILESIA, the largest province of Prussia (see vol. xx. plate I.), with an area of 15,560 square miles, forms the south-eastern limb of the kingdom, and is bounded by Brandenburg, Posen, Russian Poland, Galicia, Austrian Silesia, Moravia, Bohemia, and the kingdom and province of Saxony. Besides the bulk of the old duchy of Silesia, it comprises the countship of Glatz, a fragment of the Neumark, and part of Upper Lusatia, taken from Saxony in 1815. The province is divided into three governmental districts,—Liegnitz and Breslau corresponding to lower Silesia, while Oppeln takes in the greater part of upper, southern, or mountainous Silesia.

Physiographically Silesia is roughly divided into a flat and a hilly portion by the so-called Silesian Langenthal, which begins on the south-east near the Malapane, and extends across the province in a west-by-north direction to the Black Elster, following in part the valley of the Oder. The south-east part of the province, to the east of the Oder and south of the Malapane, consists of a hilly outpost of the Carpathians (the Tarnowitz plateau), with a mean elevation of about 1000 feet. To the west of the Oder the land rises gradually from the Langenthal towards the southern boundary of the province, which is formed by the central part of the Sudetic system, including the Glatz Mountains and the Riesengebirge (Schneekoppe, 5266 feet). Among the loftier elevations in advance of this southern barrier the most conspicuous is the Zobten (2215 feet), the historical connexion of which with the name of the province has been mentioned above. To the north and north-east of the Oder the province belongs almost entirely to the great North-German plain, though a hilly ridge, rarely attaining a height of 1000 feet, may be traced from east to west, asserting itself most definitely in the Katzengebirge. Nearly the whole of Silesia lies within the basin of the Oder, which flows through it from south-east to north-west, dividing the province into two approximately equal parts. The Vistula touches the province on the south-east, and receives a few small tributaries from it, while on the west the Spree and Black Elster belong to the system of the Elbe. The Iser rises among the mountains on the south. Among the chief feeders of the Oder are the Malapane (right), the Glatzer Neisse (left), the Katzbach (left), and the Bartsch (right), the Bober and Queiss flow through Silesia but join the Oder beyond the frontier. The only lake of any extent is the Schlawa See, 7 miles long, on the north frontier. There is a considerable difference in the climate of Lower and Upper Silesia, and some of the villages in the Riesengebirge have the lowest mean temperature of any inhabited place in Prussia (below 40° Fahr.).

Of the total area of the province 56 per cent. is occupied by arable land, 10.8 per cent. by pasture and meadow, and nearly 29 per cent. by forests. The soil along the foot of the mountains is generally good, and the district between Ratibor and Liegnitz, where 70 to 80 per cent. of the surface is under the plough, is reckoned one of the most fertile in Germany. The parts of lower Silesia adjoining Brandenburg, and also the district to the east of the Oder, are sandy and comparatively unproductive. The different cereals are all grown with success, wheat and rye sometimes in quantity enough for exportation. Flax is still a frequent crop in the hilly districts, and more sugar-beets are raised in Silesia than in any other Prussian province except Saxony. Tobacco, oil-seeds, chicory, and hops may also be specified, while a little wine, of an inferior quality, is produced near Grunberg. Mulberry trees for the silk-culture have been introduced and thrive fairly. Large estates are the rule in Silesia, where 35 per cent. of the land is in the hands of owners possessing at least 250 acres, while properties of 50,000 to 100,000 acres are common. The districts of Oppeln and Liegnitz are among the most richly wooded parts of Prussia. According to the live-stock census for 1883, Silesia contains 275,122 horses, 1,397,130 cows, 1,309,495 sheep, 518,612 pigs, 175,283 goats, and 128,828 bee-hives. The merino sheep was introduced by Frederick the Great, and since then the Silesian

[1] Compare Grunhagen, *Geschichte Schlesiens* (Gotha, 1884 *sq.*). An account of the poetical schools of Silesia is given under the heading GERMANY (vol. x. pp. 530–1).

breed of sheep has been greatly improved The woods and mountains harbour large quantities of game, such as red deer, roe-deer, wild boars, and hares, while an occasional wolf finds its way into the province from the Carpathians The fishery includes salmon in the Oder, trout in the mountain-streams and carp in the small lakes or ponds with which the province is sprinkled Compare the tables in PRUSSIA (vol xx p 14)

The great wealth of Silesia, however, lies underground in the shape of large stores of coal and other minerals, and its mining records go back to the 12th century The coal measures of Upper Silesia, in the south-east part of the province lie among the most extensive in continental Europe, and there is another large field near Waldenburg The annual output, ranging between twelve and fifteen millions of tons, valued at nearly £3,000,000 sterling, is equal to more than a quarter of the entire yield of Germany The district of Oppeln also contains a great quantity of iron (annual produce 750,000 to 800,000 tons, value about £1,000,000) The deposits of zinc in the vicinity of Beuthen are perhaps the richest in the world, and produce four fifths of the zinc of Germany (550,000 tons) The remaining mineral products include lead (from which a considerable quantity of silver is extracted), copper, cobalt, arsenic, the rare metal cadmium, alum brown coal, marble, and a few of the commoner precious stones (jaspers, agates, amethysts, &c) The province contains practically no salt or brine springs, but there are well-known mineral springs at Warmbrunn, Salzbrunn, and several other places

A busy manufacturing activity has long been united with the underground industries of Silesia, and the province in this respect yields the palm to no other part of Prussia except districts in the Rhineland and Westphalia On the plateau of Tarnowitz the working and smelting of metals is naturally the predominant industry, and in the neighbourhood of Beuthen, Konigshutte, and Gleiwitz there seems an almost endless succession of iron-works, zinc-foundries, machine-shops, and the like In 1881 the total value of the metals produced in the various foundries of the province was £2,376,250 At the foot of the Riesengebirge, and along the southern mountain line generally, the textile industries prevail Weaving has been practised in Silesia, on a large scale, since the 14th century, and Silesian linen still maintains its reputation, though the conditions of production have greatly changed Cotton and woollen goods of all kinds are also made in large quantities, and among the other industrial products are beetroot sugar (157,000 tons in 1883-84), spirits, chemicals, tobacco, starch, paper, pottery, and "Bohemian glass" Lace, somewhat resembling that of Brussels, is made by the women of the mountainous districts The trade of Silesia is scarcely so extensive as might be expected from its important industrial activity On the east it is hampered by the stringent regulations of the Russian frontier, and the great waterway of the Oder is sometimes too low in summer for navigation The extension of the railway system has, however, had its usual effect in fostering commerce, and the mineral and manufactured products of the province are freely exported

At the census of 1880 the population of Silesia was 4,007,925, of whom 2,082,084 were Roman Catholics, 1,867,489 Protestants, and 52,682 Jews About 35 per cent of the population is urban and 65 per cent rural The density is 257 per square mile, less than that of Westphalia (262) and the Rhineland (390), but the average is of course very greatly exceeded in the industrial districts, such as Beuthen The occupation census of 1883 shows that 44 per cent of the population are supported by agriculture, 36 per cent by industries, 8 4 per cent by trade, and 2 2 per cent by daily labour and domestic service, while 4 per cent belong to the official and 5 per cent to the unemployed classes. Nearly three-fourths of the inhabitants and territory are German, but to the east of the Oder the Poles (nearly 1,000,000) form the bulk of the population, while there are about 50,000 Czechs in the south part of the province and 30,000 Wends near Liegnitz The Roman Catholics, most of whom are under the ecclesiastical sway of the prince-bishop of Breslau, are predominant in Upper Silesia and Glatz, the Protestants prevail in Lower Silesia, to the west of the Oder, and in Lusatia The noblesse is very numerous in Silesia, chiefly in consequence of the Polish districts it includes The educational institutions of the province are headed by the university of Breslau In 1883-84 the percentage of illiterate recruits, in spite of the large Polish-speaking contingent, was only 1 70 The capital and seat of the provincial diet is Breslau, which is also by far the largest and most important town (298,893 inhabitants in 1885) The towns next in point of size are Gorlitz (55,120 inhabitants), Liegnitz (43,351), Konigshutte (31,831), Beuthen (26,478), Schweidnitz (23,775), Neisse (21,444), and Glogau (20,003) The province sends thirty-five members to the reichstag and sixty-five to the Prussian chamber of deputies The government divisions of Breslau and Oppeln together form the district of the 6th army corps (seat, Breslau), while Liegnitz belongs to that of the 5th army corps, the headquarters of which are at Posen Glogau, Glatz, Neisse, and Cosel are fortresses

AUSTRIAN SILESIA, the part of the duchy that remained to Austria after the Seven Years' War, is a mere fraction of the whole, its area being only 1980 square miles, or about one eighth of that of Prussian Silesia It falls into two small portions of territory, separated by a projecting limb of Moravia and surrounded by Prussian Silesia, Moravia, Hungary, and Galicia Until 1849 it was for administrative purposes reckoned a part of Moravia, but since that year it has been a crownland of the Austrian empire (the smallest of all), with the style of duchy The Troppau or western division of the crownland is flanked by the Sudetic Mountains (Altvater, 4678 feet), and the Teschen or eastern half by the Carpathians (Lissahorn, 4330 feet), and a great proportion of the surface is occupied by offshoots of these ranges The Vistula rises on the Carpathians, within Austrian Silesia, while the western part of the crownland is close to the headwaters of the Oder, which rises near at hand in Moravia Owing to its mountainous character and its slope towards the north and north-east the crownland has a somewhat severe climate for its latitude, the mean temperature being only 50° Fahr, while the annual rainfall varies from 20 to 30 inches Upwards of 45 per cent of the surface is occupied by arable land, $7\frac{1}{2}$ per cent by meadows and gardens, $10\frac{1}{2}$ per cent by pastures, and 32 per cent by forests, while $4\frac{1}{2}$ per cent is unproductive ground The soil cannot as a rule be termed rich, though some of the valleys are fertile The chief crops are oats, rye, barley, potatoes, clover, and flax Dairy-farming is carried on in the mountains after the Alpine fashion, and sheep are fairly numerous Geese and pigeons are reared in great quantities, and the hunting and fishing are both very prolific The principal mineral resources are coal (Silesia producing 13 per cent of the produce of Austria-Hungary), iron, marble, and slate Like its Prussian neighbour, the crownland boasts a very busy industrial activity, the chief products of which are its iron and steel goods, textile fabrics (linen, woollen, cotton, velvet, silk), chemicals, liqueurs, and beetroot sugar The trade is chiefly a transit one, though the manufactures and agricultural produce of the province are exported in considerable quantity Troppau, the capital of the duchy, contains large cloth manufactories, while Teschen, Bielitz, and Jagerndorf are also busy places The population in 1885 was 577,593, of whom 81,000 were Protestants and 9000 Jews About 48 per cent of the population is supported by agriculture and 27 5 per cent by industry Divided according to nationalities, there are 275,000 Germans, 130,000 Czechs, and 158,000 Poles The German element is predominant in the towns the Polish in the eastern or Teschen division The duchy sends ten members to the Austrian house of representatives and has a provincial diet of thirty one members (J F M)

SILICA, the only known oxide of silicon (see CHEMISTRY, vol v pp 521-524), occurs native in a great variety of forms, which, however, correspond to only the four distinct species of QUARTZ (*q v*, see also MINERALOGY, vol xvi p 389), tridymite, OPAL (*q v*, and compare vol xvi p 390), and siliceous earth Ordinary quartz-rock and sand are more impure forms of quartz Tridymite differs from quartz only by a lower specific gravity, and in crystallometric details, the crystals are as a rule arranged in triplets—hence the name (see vol xvi p 389) Siliceous earth when dry forms a very voluminous, soft, fine powder, it consists of the shells of *Infusoria* As a chemical species it differs little from opal Siliceous earth, having a very low rate of thermal conductivity, serves well as a stuffing for the hollow walls of ice-chests, fire-proof safes, &c It is used besides for the making of DYNAMITE (*q v*) Silica of any kind is absolutely non-volatile, and is fusible only at the temperature of the oxy-hydrogen flame, a slight admixture of base (potash, lime, &c), however, suffices to cause it to "*frit*" at a red heat It is absolutely proof against the action of water and ordinary mineral acids, hydrofluoric acid acts on it energetically, as explained in CHEMISTRY, vol v p 522

Alkaline Silicates —Silica readily dissolves at a red heat in fused alkaline carbonates, with evolution of carbonic acid and formation of alkaline silicates In this process one molecule SiO_2 of silica is capable of decomposing at most $2R_2OCO_2$ (where $R=K$ or Na) The compound $SiO_2\,2R_2O$, "orthosilicate" of alkali, freezes into a compact non-transparent mass, readily soluble in water, with formation of an intensely alkaline solution It does not unite with any additional alkali, but readily fuses up with more silica Without going beyond a red heat it is easy to produce thus homogeneous masses of *any* composition, $Na_2O\,xSiO_2$ from $x=\frac{1}{2}$ up to $x=$(at least) 4

Compounds approximating to $x=4$ are known as *water glass* Potash water glass, $K_2O\,4SiO_2$, was discovered in 1825 by Fuchs in

Munich, who noticed all its practically important properties and saw their significance. Water glass when in compact pieces looks like ordinary glass, and is not at all obviously attacked by cold water. But when the powdered substance is boiled with water it dissolves, and the solution can be boiled down to the consistence of a syrup without anything separating out even in the cold. Such water-glass syrup, when applied as a coating to wood, pasteboard, &c., dries up into a coherent varnish which renders the object non-inflammable, because in the heat of a fire the coating melts into a continuous viscid covering which prohibits access of oxygen to the interior. The early application of water glass to the scenery of the Munich court theatre explains its long immunity from destructive fires. When mixed with powdered chalk, magnesite, phosphate of lime, and many other similar materials, it gradually unites with these into hard stone-like masses. Caustic lime and magnesia (MgO) thus unite with it with exceptional promptitude, with elimination of alkali. Water glass, in short, is to the class of mineral substances referred to what ordinary glue is to wood and paper, &c., and it is used largely for analogous purposes. Fuchs himself based upon this property of his preparation a new process of wall painting which was subsequently developed and brought to great perfection by Kaulbach and others. In this process of "stereochromy," as it is called, the more immediate basis for the painting consists of a thin layer of a kind of cement made up of powdered marble, dolomite, quartz, and air-worn quicklime with water glass. On it the colours are laid with plain water, which causes them to stick on, but quite loosely, so that the artist can work at leisure and correct mistakes. The finished painting is fixed by applying to it a spray of water glass solution, which, in the course of a few days makes it perfectly fast. All that then remains to be done is to wash the painting with alcohol to remove the eliminated alkali and any dust that may have collected. A stereochromic painting (unlike one made by the old fresco process) is practically proof against atmospheric influences, even under a northern climate. In a water-glass solution the alkali is, so to say, only half combined with the silica; part of it in fact must be presumed to be present in the free state. At any rate the solution emulsionizes fats, and therefore is a cleansing agent in the same sense as soap-solution is. Water glass and other alkaline silicates are accordingly used as additions to some of the cheaper kinds of soap.

SILISTRIA, or SILISTRA, a fortified town on the south side of the Danube, 75 miles below Rustchuk, and 150 miles from the mouth of the river, is now at the head of a district in the principality of Bulgaria. In 1881 the population was 10,657.

Silistria is the Durostorum of the Romans, the Durostolos of the Byzantines, the Distr of the Bulgarians. It was one of the most important towns of the Roman province of Mœsia Inferior, successively the headquarters of the legio I Italica and the legio XI Claudia. It was defended by the Bulgarian czar Simeon against the Hungarians (893). Captured by Svyatoslaff, the Varangian called to the assistance of the emperor Nicephorus (967), it was subsequently recovered by the Bulgarians after a three months' heroic defence. Under the Turks, whose rule began in the latter part of the 14th century, Silistria continued to flourish. Hajji Khalfa describes it as the most important of all the Danubian towns. It was the seat of a Greek metropolitan with five bishops under him, and a settlement of Ragusan merchants kept alive its commercial interests. The Russians, who captured Silistria in 1810, destroyed its fortifications before they withdrew, but they were rebuilt by foreign engineers, and in 1828–9 were strong enough to offer a serious resistance to the Russians, who lost 3000 men. At that date the population, including the garrison, was 24,000, but in 1837 it was only about 4000. In 1854 the town was successfully defended by General Krach against the Russians till the arrival of the Austrians in the peninsula. It was again invested by the Russians in 1877, and on the conclusion of peace was evacuated by the Turks.

SILIUS ITALICUS, a Latin epic poet, was born in 25 and died in 101 A.D. His birthplace is unknown. From his cognomen Italicus the conclusion has been drawn that he came from the town of Italica in Spain; but Latin usage would in that case have demanded the form *Italicensis*, and it is highly improbable that Martial would have failed to name him among the literary celebrities of Spain in the latter half of the 1st century. The conjecture that Silius was from Italica, the capital of the Italian confederation during the Social War, is open to still stronger objection. Most likely some ancestor of the poet acquired the title "Italicus" from having been a member of one of the corporations of "Italici" who are often mentioned in inscriptions from Sicily and elsewhere. In early life Silius was a renowned forensic orator, later a safe and cautious politician, without ability or ambition enough to be legitimately obnoxious to the cruel rulers under whom he lived. But mediocrity was hardly an efficient protection against the murderous whims of Nero, and Silius was generally believed to have secured at once his own safety and his promotion to the consulship by putting his oratorical powers to discreditable use in the judicial farces which often ushered in the doom of the emperor's victims. He was consul in the year of Nero's death (69), and is mentioned by Tacitus as having been one of two witnesses who were present at the conferences between Vitellius and Flavius Sabinus, the elder brother of Vespasian, when the legions from the East were marching rapidly on the capital. The life of Silius after his consulship is well depicted by the younger Pliny:—"He conducted himself wisely and courteously as the friend of the luxurious and cruel Vitellius; he won repute by his proconsulship of Asia, and obliterated by the praiseworthy use he made of his leisure the stain he had incurred through his active exertions in former days. In dignity and contentment, avoiding power and therefore hostility, he outlived the Flavian dynasty, keeping to a private station after his governorship of Asia." His poem contains only two passages relating to the Flavians; in both Domitian is eulogized as a warrior; in one he figures as a singer whose lyre is sweeter than that of Orpheus himself. Silius had evidently little taste for bowing down in the house of Rimmon, and refrained from using the many opportunities which his epic afforded for humouring the vanity of the imperial house. He was a great student and patron of literature and art, and a passionate collector. Two great Romans of the past, Cicero and Virgil, were by him idealized and veritably worshipped, and he was the happy possessor of their estates at Tusculum and Naples. The later life of Silius was passed on the Campanian shore, hard by the tomb of Virgil, at which he offered the homage of a devotee. He closely emulated the lives of his two great heroes; the one he followed in composing epic verse, the other in debating philosophic questions with his friends of like tastes. Among these was Epictetus, who judged him to be the most philosophic spirit among the Romans of his time, and Cornutus, the Stoic, rhetorician, and grammarian, who appropriately dedicated to Silius a commentary upon Virgil. Though the verse of Silius is not wrapped in Stoic gloom like that of Lucan, yet Stoicism lends in many places a not ungraceful gravity to his poem. Silius was one of the numerous Romans of the early empire who had the courage of their opinions, and carried into perfect practice the theory of suicide adopted by their school. Stricken by an incurable disease, he starved himself to death, keeping a cheerful countenance to the end.

Whether Silius committed to writing his philosophic dialogues or not, we cannot say. Chance has preserved to us his epic poem entitled *Punica*, in seventeen books, and comprising some fourteen thousand lines. The epics of Silius, Lucan, Statius, and Valerius Flaccus are but a few waifs carried down to us by the wandering stream of time from the vast mass of post-Virgilian epics. Long before Silius bethought himself of his epic all possible historical and mythological themes had been worn to tatters by these poets. In choosing the Second Punic War for his subject, Silius had, we know, many predecessors, as he doubtless had many followers. From the time of Nævius onwards every great military struggle in which the Romans had been engaged had found its poet over and over again. In justice to Silius and Lucan, it should be observed that the mythologic poet had a far easier task than the historic. In a well-known passage Petronius pointedly describes the difficulties of the historic theme. A poet, he said, who should take upon him the vast subject of the civil wars would break down beneath the burden unless he were "full of learning," since he would have not merely to record facts, which the historians did much better, but must possess an unshackled

genius, to which full course must be given by the use of digressions, by bringing divine beings on to the stage, and by giving generally a mythologic tinge to the subject. The Latin laws of the historic epic were fixed by Ennius, and were still binding when Claudian wrote. They were never seriously infringed, except by Lucan, who substituted for the *dei ex machina* of his predecessors the vast, dim, and imposing Stoic conception of destiny. By protracted application, and being (to use the significant phrase of Petronius) "full of learning," Silius had acquired excellent recipes for every ingredient that went to the making of the conventional historic epic. Though he is not named by Quintilian, he is probably hinted at in the mention of a class of poets who, as the writer says, "write to show their learning." To seize the moments in the history, however unimportant, which were capable of picturesque treatment, to pass over all events, however important, which could not readily be rendered into heroics, to stuff out the somewhat modern heroes to something like Homeric proportions, to subject all their movements to the passions and caprices of the Olympians, to ransack the poetry of the past for incidents and similes on which a slightly new face might be put, to foist in by well worn artifices episodes, however strange to the subject, taken from the mythologic or historic glories of Rome and Greece,—all this Silius knew how to do, as he knew his own fingers and nails. He did it all with the languid grace of the inveterate connoisseur, and with a simplicity foreign to his time, which sprang in part from cultivated taste and horror of the venturesome world, and in part from the subdued tone of a life which had come unscathed through the reigns of Caligula, Nero, and Domitian. The more threadbare the theme, and the more worn the machinery, the greater the need of genius. Two of the most rigid requirements of the ancient epic were abundant similes and abundant single combats. But all the obvious resemblances between the actions of heroic man and external nature had long been worked out, while for the renovation of the single combat little could be done till the hero of the Homeric type was replaced by the mediæval knight. Silius, however, had perfect poetic appreciation, with scarce a trace of poetic creativeness. No writer has ever been more correctly and more uniformly judged by contemporaries and by posterity alike. Only the shameless flatterer, Martial, ventured to call his friend a poet as great as Virgil. But the younger Pliny gently says that he wrote poems with greater diligence than talent, and that, when, according to the fashion of the time, he recited them to his friends, "he sometimes found out what men really thought of them." It is indeed strange that the poem lived on. Silius is never mentioned by ancient writers after Pliny except Sidonius, who, under different conditions and at a much lower level, was such another as he. Since the discovery of Silius by Poggio, no modern enthusiast has arisen to sing his praises, and in the last sixty years he has found no editor, even for his text. Eighteenth century editors, at a time when modern Silii were numerous in the field of literature and more fashionable than they have been since, found in the *Punica* passages not unworthy of comparison with the *Henriade*, and thought that Silius did not disgrace Virgil; but even such gentle commendation is not likely to be repeated again. Yet, by the purity of his taste and his Latin in an age when taste was fast becoming vicious and Latin corrupt, by his presentation to us of a type of a thousand vanished Latin epics, and by the historic aspects of his subject, Silius merits better treatment from scholars than he has received. The general reader he can hardly interest again. He is indeed of imitation all compact, and usually dilutes what he borrows; he may add a new beauty, but new strength he never gives. Hardly a dozen lines anywhere are without an echo of Virgil, and there are frequent admixtures of Lucretius, Horace, Ovid, Lucan, Homer, Hesiod, and many other poets still extant. If we could reconstitute the library of Silius we should probably find that scarcely an idea or a phrase in his entire work was wholly his own.

The raw material of the *Punica* was supplied in the main by the third decade of Livy, though Silius may have consulted other historians of the Hannibalic war. Such facts as are used are generally presented with their actual circumstances unchanged, and in their historic sequence. The spirit of the Punic times is but rarely misconceived,—as when to secret voting is attributed the election of men like Flaminius and Varro, and distinguished Romans are depicted as contending in a gladiatorial exhibition. Silius clearly intended the poem to consist of twenty-four books, like the Iliad and the Odyssey, but after the twelfth he hurries in visible weariness to the end and concludes with seventeen. The general plan of the epic follows that of the Iliad and the Æneid. Its theme is conceived as a duel between two mighty nations, with parallel dissensions among the gods. Scipio and Hannibal are the two great heroes who take the place of Achilles and Hector on the one hand and of Æneas and Turnus on the other, while the minor figures are all painted with Virgilian or Homeric pigments. In the delineation of character our poet is neither very powerful nor very consistent. His imagination was too weak to realize the actors with distinctness and individuality. His Hannibal is evidently at the outset meant for an incarnation of cruelty and treachery, the embodiment of all that the vulgar Roman attached to the name "Punic." But in the course of the poem the greatness of Hannibal is borne in upon the poet, and his feeling of it betrays itself in many touches. Thus he names Scipio "the great Hannibal of Ausonia"; he makes Juno assure the Carthaginian leader that if fortune had only permitted him to be born a Roman he would have been admitted to a place among the gods; and, when the ungenerous monster of the first book accords in the fifteenth a splendid burial to Marcellus, the poet cries, "You would fancy it was a Sidonian chief who had fallen." Silius deserves little pity for the failure of his attempt to make Scipio an equipoise to Hannibal and the counterpart in personal prowess and prestige of Achilles. He becomes in the process almost as mythical a figure as the mediæval Alexander. The best drawn of the minor characters are Fabius Cunctator, an evident copy of Lucan's Cato, and Paullus, the consul killed at Cannæ, who fights, hates, and dies like a genuine man.

Clearly it was a matter of religion with Silius to repeat and adapt all the striking episodes of Homer and Virgil. Hannibal must have a shield of marvellous workmanship like Achilles and Æneas; because Æneas descended into Hades and had a vision of the future history of Rome, so must Scipio have his revelation from heaven; Trebia, choked with bodies, must rise in ire like Xanthus, and be put to flight by Vulcan; for Virgil's Camilla there must be an Asbyte, heroine of Saguntum; the beautiful speech of Euryalus when Nisus seeks to leave him is too good to be thrown away,—furbished up a little, it will serve as a parting address from Imilce to her husband Hannibal. The descriptions of the numerous battles are made up in the main, according to epic rule, of single combats—wearisome sometimes in Homer, wearisome oftener in Virgil, painfully wearisome in Silius. The different component parts of the poem are on the whole fairly well knit together, and the transitions are not often needlessly abrupt; yet occasionally incidents and episodes are introduced with all the irrelevancy of the modern novel. A son of Regulus escapes from Thrasymeno to a hut, merely to find there an old servant of his father, and to afford him the opportunity of telling over again the tale of the first war against the Carthaginians. To give scope for a eulogy of Cicero, an ancestor of his fights at Cannæ, and strong devices sometimes usher in such stories as the judgment of Paris and the choice of Hercules. The interposition of the gods is, however, usually managed with dignity and appropriateness.

As to diction and detail, we miss, in general, power rather than taste. The metre runs on with correct smooth monotony, with something always of the Virgilian sweetness, though attenuated, but nothing of the Virgilian variety and strength. The dead level of literary execution is seldom broken by a rise into the region of genuine pathos and beauty, or by a descent into the ludicrous or the repellent. There are few absurdities, but the restraining force is trained perception and not a native sense of humour, which, ever present in Homer, not entirely absent in Virgil, and sometimes finding grim expression in Lucan, fails Silius entirely. The address of Anna, Dido's sister, to Juno compels a smile. Though deified on her sister's death, and for a good many centuries already an inhabitant of heaven, Anna meets Juno for the first time on the outbreak of the *Second* Punic War, and deprecates the anger of the queen of heaven for having deserted the Carthaginians and attached herself to the Roman cause. Hannibal's parting address to his child is also comical: he recognizes in the "heavy wailing" of the year old babe "the seeds of rages like his own." But Silius might have been forgiven for a thousand more weaknesses than he has if in but a few things he had shown strength. The grandest scenes in the history before him fail to lift him up; his treatment, for example, of Hannibal's Alpine passage falls immensely below Lucan's vigorous delineation of Cato's far less stirring march across the African deserts.

But in the very weaknesses of Silius we may discern merit. He at least does not try to conceal defects of substance by contorted rhetorical conceits and feebly forcible exaggerations. In his ideal of what Latin expression should be he comes near to his contemporary Quintilian, and resolutely holds aloof from the tenor of his age. Perhaps his want of success with the men of his time was not wholly due to his faults. His self control rarely fails him; it stands the test of the horrors of war, and of Venus working her will on Hannibal at Capua. The reader of Statius and even Propertius will be thankful for the rarity of recondite epithets, such as "Rhœtean destiny," "Garamantian standards," "Lagean river," "Smyrnæan strings." Only a few passages here and there betray the true silver Latin extravagance, as when Hannibal is compared for speed to a tigress reft of her cubs, which darts forth *and in a few hours* traverses the Caucasus, and with a "winged" leap flies across *the Ganges*; or when the Carthaginians after Capua launch their spears but are too enervated to *make them whiz*; or when the plague-stricken and famine-

wasted men of Syracuse hide their diminished faces far within their helmets, and carefully shade their pallor lest hope should arise for the enemy. In the avoidance of rhetorical artifice and epigrammatic antithesis Silius stands in marked contrast to Lucan. Yet he can be pointed, so of Fabius, "laudum cladumque quieta Mente capax", and of Scævola, "Aspera semper amans et par cuicumque periclo", and of Africa, "Altrix bellorum bellatorumque virorum Tellus, nec fidens nudo sine fraudibus ensi." Looking at Silius merely as a poet he may not deserve high praise, but, as he is a unique specimen and probably the best of a once numerous class, the preservation of his poem among the remains of Latin literature is a fortunate accident.

The poet's full name, Ti. Catius Silius Italicus, is preserved in an inscription (*C. I. L.*, vi. 1984). The poem was discovered in a MS., possibly at Constance, by Poggio, in 1416 or 1417; from this now lost MS. all existing MSS., which belong entirely to the 15th century, are derived. A valuable MS. of the 8th or 9th century, found at Cologne by L. Carrion in the latter part of the 16th century, disappeared soon after its discovery. Two *editiones principes* appeared at Rome in 1471; the principal editions since have been those of Heinsius (1600), Drakenborch (1717), and Ernesti (Leipsic, 1791). A useful *variorum* edition is that of Lemaire (Paris, 1823). The recent *lucubrationes* on Silius are mostly small pamphlets, enumerated by Engelmann (*Bibl. Script. Class.*, 1878). (J. S. R.)

SILK

SILK is a fibrous substance produced by many insects, principally in the form of a cocoon or covering within which the creatures are enclosed and protected during the period of their principal transformations. The webs and nests, &c., formed by spiders are also of silk. But the fibres used for manufacturing purposes are exclusively produced by the mulberry silk-moth of China, *Bombyx mori*, and a few other moths closely allied to that insect (see vol. iv. p. 596). Among the Chinese the name of the silkworm is "si," Corean "soi", to the ancient Greeks it became known as σήρ, the nation whence it came was to them Σῆρες, and the fibre itself σηρικόν, whence the Latin *sericum*, the French *soie*, the German *Seide*, and the English *silk*.

The silk industry originated in China, and according to native records it has existed there from a very remote period. The empress Se-ling-she, wife of a famous emperor, Hwang-te (2640 B.C.), encouraged the cultivation of the mulberry tree, the rearing of the worms, and the reeling of silk. This empress is said to have devoted herself personally to the care of silkworms, and she is by the Chinese credited with the invention of the loom. A voluminous ancient literature testifies not only to the antiquity but also to the importance of Chinese sericulture, and to the care and attention bestowed on it by royal and noble families. The Chinese guarded the secrets of their valuable art with vigilant jealousy, and there is no doubt that many centuries passed before the culture spread beyond the country of its origin. Through Corea a knowledge of the silkworm and its produce reached Japan, but not before the early part of the 3d century. One of the most ancient books of Japanese history, the *Nihongi*, states that towards 300 A.D. some Coreans were sent from Japan to China to engage competent people to teach the arts of weaving and preparing silk goods. They brought with them four Chinese girls, who instructed the court and the people in the art of plain and figured weaving, and to the honour of these pioneer silk weavers a temple was erected in the province of Setsu. Great efforts were made to encourage the industry, which from that period grew into one of national importance. At a period probably little later a knowledge of the working of silk travelled westward, and the cultivation of the silkworm was established in India. According to a tradition the eggs of the insect and the seed of the mulberry tree were carried to India by a Chinese princess concealed in the lining of her headdress. The fact that sericulture was in India first established in the valley of the Brahmaputra and in the tract lying between that river and the Ganges renders it probable that it was introduced overland from the Chinese empire. From the Ganges valley the silkworm was slowly carried westward and spread in Khotan, Persia, and the states of Central Asia.

Most critics recognize in the obscure word *dmeshek*, Amos iii. 12, a name of silk corresponding to the Arabic *dimakš*, late Greek μέταξα, English *damask*, and also follow the ancients in understanding *meshi*, Ezek. xvi. 10, 13, of "silken gauze." But the first notice of the silkworm in Western literature occurs in Aristotle, *Hist. Anim.*, v. 19 (17), 11 (6), where he speaks of "a great worm which has horns and so differs from others. At its first metamorphosis it produces a caterpillar, then a bombylius, and lastly a chrysalis,—all these changes taking place within six months. From this animal women separate and reel off the cocoons and afterwards spin them. It is said that this was first spun in the island of Cos by Pamphile, daughter of Plates." Aristotle's vague knowledge of the worm may have been derived from information acquired by the Greeks with Alexander the Great; but long before this time raw silk must have begun to be imported at Cos, where it was woven into a gauzy tissue, the famous *Coa vestis*, which revealed rather than clothed the form.

Towards the beginning of the Christian era raw silk began to form an important and costly item among the prized products of the East which came to Rome. Allusions to silk and its source became common in classical literature; but, although these references show familiarity with the material, they are singularly vague and inaccurate as to its source; even Pliny knew nothing more about the silkworm than could be learned from Aristotle's description. The silken textures which at first found their way to Rome were necessarily of enormous cost, and their use by men was deemed a piece of effeminate luxury. From an anecdote of Aurelian, who neither used silk himself nor would allow his wife to possess a single silken garment, we learn that silk was worth its weight in gold.

Notwithstanding its price and the restraints otherwise put on the use of silk the trade grew. Under Justinian a monopoly of the trade and manufacture was reserved to the emperor, and looms, worked by women, were set up within the imperial palace at Constantinople. Justinian also endeavoured, through the Christian prince of Abyssinia, to divert the trade from the Persian route along which silk was then brought into the east of Europe. In this he failed, but two Persian monks who had long resided in China, and there learned the whole art and mystery of silkworm rearing, arrived at Constantinople and imparted their knowledge to the emperor. By him they were induced to return to China and attempt to bring to Europe the material necessary for the cultivation of silk, which they effected by concealing the eggs of the silkworm in a hollow cane. From the precious contents of that bamboo tube, brought to Constantinople about the year 550, were produced all the races and varieties of silkworm which stocked the Western world, and which gave trade, prosperity, and untold wealth to great communities for more than twelve hundred years. The necessity for again going to the East for a supply of silkworm eggs has only arisen in our own day.

Under the care of the Greeks the silkworm took kindly to its Western home and flourished, and the silken textures of Byzantium became famous. At a later period the conquering Saracens obtained a mastery over the trade, and by them it was spread both east and west,—the textures becoming meantime impressed with the

patterns and colours peculiar to that people. They established the trade in the thriving towns of Asia Minor, and they planted it as far west as Sicily, as Sicilian silks of the 12th century with Saracenic patterns still testify. Ordericus Vitalis, who died in the first half of the 12th century, mentions that the bishop of St Evroul, in Normandy brought with him from Apulia in southern Italy several large pieces of silk, out of the finest of which four copes were made for his cathedral chanters. The cultivation and manufacture spread northwards to Florence, Milan, Genoa, and Venice—all towns which became famous for silken textures in mediæval times. In 1480 silk weaving was begun under Louis XI at Tours, and in 1520 Francis I brought from Milan silkworm eggs, which were reared in the Rhone valley. About the beginning of the 17th century Olivier de Serres and Laffemas, somewhat against the will of Sully, obtained royal edicts favouring the growth of mulberry plantations and the cultivation of silk; but it cannot be said that these industries were firmly established till Colbert encouraged the planting of the mulberry by premiums, and otherwise stimulated local efforts.

Into England silk manufacture was introduced during the reign of Henry VI., but the first serious impulse to manufactures of that class was due to the immigration in 1585 of a large body of skilled Flemish weavers who fled from the Low Countries in consequence of the struggle with Spain then devastating their land. Precisely one hundred years later religious troubles again gave the second and most effective impetus to the silk-trade of England, when the revocation of the edict of Nantes sent simultaneously to Switzerland, Germany, and England a vast body of the most skilled artisans of France, who planted in these countries silk-weaving colonies which are to this day the principal rivals of the French manufacturers. The bulk of the French Protestant weavers settled at Spitalfields, London,—an incorporation of silk throwsters having been there formed in 1629. James I. used many efforts to encourage the planting of the mulberry and the rearing of silkworms both at home and in the colonies. In 1825 a public company was formed and incorporated under the name of the British, Irish, and Colonial Silk Company, with a capital of £1,000,000, principally with the view of introducing sericulture into Ireland, but it was a complete failure, and the rearing of the silkworm cannot be said ever to have become a branch of British industry.

In 1522 Cortes appointed officials to introduce sericulture into New Spain (Mexico), and mulberry trees were then planted and eggs were brought from Spain. The Mexican adventure is mentioned by Acosta, but all trace of the culture had died out before the end of the century. In 1609 James I. attempted to reinstate the silkworm on the American continent, but his first effort failed through shipwreck. An effort made in 1619 obtained greater success, and, the materials being present, the Virginian settlers were strongly urged to devote attention to the profitable industry of silk cultivation. Sericulture was enjoined under penalties by statute; it was encouraged by bounties and rewards; and its prosecution was stimulated by learned essays and rhapsodical rhymes, of which this is a sample:—

> Where Wormes and Food doe naturally abound
> A gallant Silken Trade must there be found.
> Virginia excels the World in both—
> Envie nor malice can gainesay this troth!

In the prospectus of Law's great *Compagnie des Indes Occidentales* the cultivation of silk occupies a place among the glowing attractions which allured so many to disaster. Onward till the period of the War of Independence bounties and other rewards for the rearing of worms and silk filature continued to be offered; and just when the war broke out Benjamin Franklin and others were engaged in nursing a filature into healthy life at Philadelphia. With the resumption of peaceful enterprise, the stimulus of bounties was again applied—first by Connecticut in 1783; and such efforts have been continued sporadically down almost to the present day. Bounties were last offered by the State of California in 1865–66, but the State law was soon repealed, and an attempt to obtain State encouragement again in 1872 was defeated. About 1838 a speculative mania for the cultivation of silk developed itself with remarkable severity in the United States. It was caused principally through the representations of Samuel Whitmarsh as to the capabilities of the South Sea Islands mulberry (*Morus multicaulis*) for feeding silkworms; and so intense was the excitement that plants and crops of all kinds were displaced to make room for plantations of *multicaulis*. In Pennsylvania as much as $300,000 changed hands for plants in one week, and frequently the young trees were sold two and three times over within a few days at ever-advancing prices. Plants of a single year's growth reached the ridiculous price of $1 each at the height of the fever, which, however, did not last long, for in 1839 the speculation collapsed; the famous *Morus multicaulis* was found to be no golden tree, and the costly plantations were uprooted.

The most singular feature in connexion with the history of silk is the persistent efforts which have been made by monarchs and other potentates to stimulate sericulture within their dominions, efforts which continue to this day in British colonies, India, and America. These endeavours to stimulate by artificial means have in scarcely any instance resulted in permanent success. In truth raw silk can only be profitably brought to the market where there is abundant and very cheap labour,—the fact that China, Japan, Bengal, Piedmont, and the Levant are the principal producing localities making that plain.

The Silkworm.

The mulberry-feeding moth, *Bombyx mori*, which is the principal source of silk, belongs to the *Bombycidæ*, a family of *Lepidoptera* in which are embraced some of the largest and most handsome moths (see vol. iv. p. 596). *B. mori* is itself an inconspicuous moth (figs. 1 and 2) of an ashy white colour, with a body in the case of the male not half an inch in length, the female being a little longer and stouter.

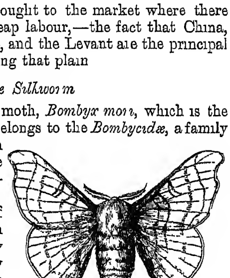

FIG. 1.—*Bombyx mori* (male).

Its wings are short and weak; the fore pair are falcate, and the hind pair do not reach to the end of the body. The larva (fig. 3) is hairless, of an ashy grey or cream colour, attains to a length of from 3 to $3\frac{1}{2}$ inches, and is slender in comparison with many of its allies. The second thoracic ring is humped, and there is a spine-like horn or protuberance at the tail.

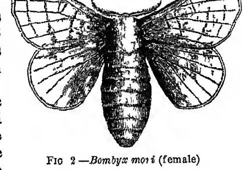

FIG. 2.—*Bombyx mori* (female).

The common silkworm produces as a rule only one generation during the year; but there are races in cultivation which

are bivoltine, or two-generationed, and some are multivoltine. Its natural food is the leaves of mulberry trees. The silk glands or vessels consist of two long thick-walled sacs running along the sides of the body, which open by a common orifice—the spinneret or seripositor—on the under lip of the larva. Fig. 4 represents the head (*a*) and feet (*b*, *b*) of the common silkworm, while *c* is a diagrammatic view of the silk glands. As the larva approaches maturity these vessels become gorged with a clear viscous fluid, which, upon being exposed to the air immediately hardens to a solid mass. Advantage is taken

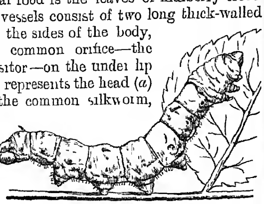

FIG. 3.—Larva of *Bombyx mori*.

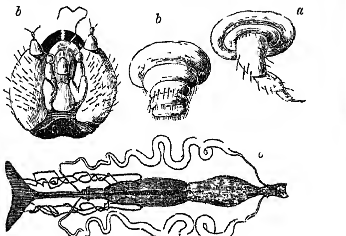

Fig. 4.

of this peculiarity to prepare from fully-developed larvæ silkworm gut used for casting lines in rod-fishing, and for numerous other purposes where lightness, tenacity, flexibility, and strength are essential. The larvæ are killed and hardened by steeping some hours in strong acetic acid; the silk glands are then separated from the bodies, and the viscous fluid drawn out to the condition of a fine uniform line, which is stretched between pins at the extremity of a board. The board is then exposed to the sunlight till the lines dry and harden into the condition of gut. The preparation of gut is, however, merely an unimportant collateral manufacture. When the larva is fully mature, and ready to change into the pupa condition, it proceeds to spin its cocoon, in which operation it ejects from both glands simultaneously a line or thread about 4000 yards in length, moving its head round in regular order continuously for three days or thereby. The thread so ejected forms the silk of commerce, which as wound in the cocoon consists of two filaments—one from each gland—laid side by side and agglutinated into one fibre (Fr. *bave*) by their own adhesive constituents. Under the microscope, therefore, cocoon silk presents the appearance (fig. 5) of a somewhat flattened combination of two filaments placed side by side, being

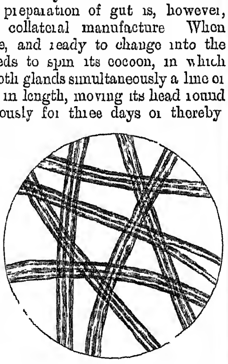

FIG. 5.—Microscopic appearance of Silk of *Bombyx mori*.

on an average from ·033 to ·036 mm. broad by ·020 to ·025 mm. in thickness. The cocoons are white or yellow in colour, oviform in shape, with often a constriction in the middle (fig. 6). According to race, &c., they vary considerably in size and weight, but on an average they measure from an inch to an inch and a half in length, and from half an inch to an inch in diameter. They form hard, firm, and compact shells with some straggling flossy filaments on the exterior, and the interior layers are so closely and densely agglutinated as to constitute a parchment-like mass which resists all attempts at unwinding. The whole cocoon with its enclosed pupa weighs from 15 grains for the smaller races to about 50 grains for the breeds which spin large cocoons. From two to three weeks after the completion of the cocoon the enclosed insect is ready to escape; it moistens one end of its self-made prison, thereby enabling itself to push aside the fibres and make an opening by which the perfect moth comes forth. The sexes almost immediately couple; the female in from four to six days lays her eggs, numbering 500 and upwards; and, with that the life cycle of the moth being complete, both sexes soon die.

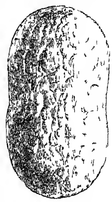

FIG. 6.—Cocoon of *Bombyx mori*.

Sericulture.

The art of sericulture concerns itself with the rearing of silkworms under artificial or domesticated conditions, their feeding, the formation of cocoons, the securing of these before they are injured and pierced by the moths, and the maturing of a sufficient number of moths to supply eggs for the cultivation of the following year. The first essential is a stock of mulberry trees adequate to feed the worms in their larval stage. The leaves preferred in Europe are those of the white-fruited mulberry, *Morus alba*, but there are numerous other species which appear to be equally suitable. The soil in which the mulberry grows, and the age and condition of the trees, are important factors in the success of silkworm cultivation; and it has been too often proved that the mulberry will grow in situations where, from the nature of the leaf the trees put forth and from other circumstances, silkworms cannot be profitably reared. An elevated position with dry friable well-drained soil produces the best quality of leaves. Throughout the East the species of mulberry cultivated are numerous, but, as these trees have been grown for special purposes at least for three thousand years, they show the complex variations peculiar to most cultivated plants.

The eggs of the silkworm, called *graine*, are hatched out by artificial heat at the period when the mulberry leaves are ready for the feeding of the larvæ. These eggs are very minute—about one hundred weighing a grain; and a vast number of hatched worms may at first be kept in a small space; but the rapid growth and voracious appetite of the caterpillars demand quickly increasing and ample space. Pieces of paper punctured with small holes are placed over the trays in which the hatching goes on; and the worms, immediately they burst their shell, creep through these openings to the light, and thereby scrape off any fragments of shell which, adhering to their skin, would kill them by constriction. The rearing-house in which the worms are fed (Fr. *magnanerie*) must be a spacious, well-lighted, and well-ventilated apartment, in which scrupulous cleanliness and sweetness of air are essential, and in which the temperature may to a certain extent be under control. The worms are more hardy than is commonly supposed, and endure variations of temperature from 62° to 78° F. without any injury; but higher temperature is very detrimental. The lower the temperature at which the worms are maintained the slower is their growth and development; but their health and vigour are increased, and the cocoon they spin is proportionately bigger. The

worms increase in size with astonishing rapidity, and no less remarkable is their growing voracity. Certain races moult or cast their skin three times during their larval existence, but for the most part the silkworm moults four times—about the sixth, tenth, fifteenth, and twenty-third days after hatching. As these moulting periods approach, the worms lose their appetite and cease eating, and at each period of change they are left undisturbed and free from noise. The worms from 1 oz. of graine—numbering, say, 40,000—consume in their first stage about 6 lb of picked leaf, in the second 18 lb, in the third 60 lb, fourth 180 lb, and in their final stage 1098 lb,—in all 1362 lb of mulberry leaf; but from that is to be deducted about 590 lb of unconsumed fragments removed in the litter, giving of leaf really consumed 772 lb. An ounce of graine so treated may yield from 80 to 120 lb of cocoons, 85 per cent. of which consists of the weight of chrysalides and 15 per cent. of pure cocoon. The growth of the worms during their larval stage is thus stated by Count Dandolo:—

	Weight per 100	Size in Lines
Worms newly hatched	1 gr.	1
After 1st moult	15 ,,	4
,, 2d ,,	94 ,,	6
,, 3d ,,	400 ,,	12
,, 4th ,,	1628 ,,	20
Greatest weight and size	9500 ,,	40

When the caterpillars are mature and ready to undergo their transformation into the pupa condition, they cease eating for some time and then begin to ascend the brushwood branches or echelletes provided for them, in which they set about the spinning of their cocoons. Crowding of positions must now be guarded against, to prevent the spinning of double cocoons (*doubions*) by two worms spinning together and so interlacing their threads that they cannot be reeled. The insects complete their cocoons in from three to four days, and in two or three days thereafter the cocoons are collected, and the pupa killed to prevent its further progress and the bursting of the shell by the fully developed moth. Such cocoons as are selected for the production of graine, on the other hand, are collected, freed from the external floss, and preserved at a temperature of from 66° to 72° Fahr., and after a lapse of from eleven to fifteen days the moths begin to make their appearance. The coupling which immediately takes place demands careful attention; the males are afterwards thrown away, and the impregnated females placed in a darkened apartment till they deposit their eggs.

Diseases.—That the silkworm is subject to many and serious diseases is only to be expected of a creature which for upwards of 4000 years has been propagated under purely artificial conditions, and these most frequently of a very insanitary nature, and where, not the healthy life of the insect, but the amount of silk it could be made to yield was the object of the cultivator. Among the most fatal and disastrous of these diseases with which the cultivator had long to grapple was "muscardine," a malady due to the development of a fungus, *Botrytis bassiana*, in the body of the caterpillar. The disease is peculiarly contagious and infectious, owing to the development of the fungus through the skin, whence spores are freed, which, coming in contact with healthy caterpillars, fasten on them and germinate inwards, giving off corpuscles within the body of the insect. Muscardine, however, has not been epidemic for many years. But about the year 1853 anxious attention began to be given in France to the ravages of a disease among silkworms, which from its alarming progress threatened to issue in national disaster. This disease, which at a later period became known as "pebrine," —a name given to it by M. de Quatrefages, one of its many investigators,—had first been noticed in France at Cavaillon in the valley of the Durance near Avignon. Pebrine manifests itself by dark spots in the skin of the larvæ; the eggs do not hatch out, or hatch imperfectly, the worms are weak, stunted, and unequal in growth, languid in movement, fastidious in feeding; many perish before coming to maturity; if they spin a cocoon it is soft and loose, and moths when developed are feeble and inactive. When sufficient vitality remains to produce a second generation it shows in increased intensity the feebleness of the preceding. The disease is thus hereditary, but in addition it is virulently infectious and contagious. From 1850 onwards French cultivators were compelled, in order to keep up their silk supply, to import graine from uninfected districts. The area of infection increased rapidly, and with that the demand for healthy graine correspondingly expanded, while the supply had to be drawn from increasingly remote and contracted regions. Partly supported by imported eggs, the production of silk in France was maintained, and in 1853 reached its maximum of 26,000,000 kilos of cocoons, valued at 117,000,000 francs. From that period, notwithstanding the importation at great cost of foreign graine, reaching in some years to 60,000 kilos, the production of silk fell off with startling rapidity: in 1856 it was not more than 7,500,000 kilos of cocoons; in 1861 and 1862 it fell as low as 5,800,000 kilos; and in 1865 it touched its lowest weight of about 4,000,000 kilos. In 1867 De Quatrefages estimated the loss suffered by France in the 13 years following 1853, from decreased production of silk and price paid to foreign cultivators for graine, to be not less than one milliard of francs. In the case of Italy, where the disease showed itself later but even more disastrously, affecting a much more extended industry, the loss in 10 years De Quatrefages stated at two milliards. A loss of £120,000,000 sterling within 13 years, falling on a limited area, and on one class within these two countries, constituted indeed a calamity on a national scale, calling for national effort to contend with its devastating action. The malady, moreover, spread eastward with alarming rapidity, and, although it was found to be less disastrous and fatal in Oriental countries than in Europe, the sources of healthy graine became fewer and fewer, till only Japan was left as an uninfected source of European graine supply.

A scourge which so seriously menaced the very existence of the silkworm in the world necessarily attracted a great amount of attention. The disease was studied by the most eminent men of science; reports and suggestions innumerable were made, and a whole pharmacopœia of remedies proposed. So early as 1849 M. Guérin Meneville observed in the blood of diseased silkworms certain vibratory corpuscles, but neither did he nor the Italian Signor Filippi, who studied them later, connect them distinctly with the disease. The corpuscles were first accurately described by Signor Cornalia, whence they are spoken of as the corpuscles of Cornalia. The French Academy charged MM. de Quatrefages, Decaisne, and Peligot with the study of the disease, and these learned men issued two elaborate reports—*Études sur les Maladies Actuelles des Vers à Soie*, 1859, and *Nouvelles Recherches sur les Maladies Actuelles des Vers à Soie*, 1860; but the suggestions they were able to offer had not the effect of stopping the march of the disease. In 1865 M. Pasteur undertook a Government commission for the investigation of the malady. Attention had been previously directed to the corpuscles of Cornalia, and it had been found, not only that they occurred in the blood, but that they gorged the whole tissues of the insect, and their presence in the eggs themselves could be microscopically demonstrated. Pasteur set himself to elucidate the life-history of these corpuscles, and he soon established (1) that the corpuscles are the special characteristic of the disease, and that these invariably manifest themselves, if not in earlier stages, then in the mature moths, (2) that the corpuscles are parasites, and not only the sign but the cause of the disease, and (3) that the disease manifests itself by heredity, by contagion with diseased worms, and by the eating of leaves on which corpuscles are spread. In this connexion he established the very important practical conclusion that worms which contract the disease during their own life-cycle retain sufficient vitality to feed, develop, and spin their cocoon, although the next generation is invariably infected and shows the disease in its most virulent and fatal form. But this fact enabled the cultivator to know with assurance whether the worms on which he bestowed his labour would yield him a harvest of silk. He had only to examine the bodies of the moths yielding his graine: if they were free from disease then a crop was sure; if they were infected the education would assuredly fail. Pasteur brought out the fact that the malady had existed from remote periods and in many unsuspected localities. He found corpuscles in Japanese cocoons and in many specimens which had been preserved for lengthened periods in public collections. Thus he came to the conclusion that the malady had been inherent in many successive generations of the silkworm, and that the epidemic condition was only an exaggeration of a normal state brought about by the method of cultivation and production of graine pursued. The cure proposed by Pasteur was simply to take care that the stock whence graine was obtained should be healthy, and the offspring would then be healthy also. Small educations reared apart from the ordinary magnanerie, for the production of graine alone, were recommended. At intervals of five days after spinning their cocoons specimens were to be opened and the chrysalides examined microscopically for corpuscles. Should none have appeared till towards the period of transformation and escape of the moths, the eggs subsequently hatched out might be depended on to yield a fair crop of silk, should the moths prove perfectly free from corpuscles.

after depositing their eggs the next generation would certainly live well through the larval stage. For special treatment towards the regeneration of an infected race, the most robust worms were to be selected, and the moths issuing from the cocoons were to be coupled in numbered cells, where the female was to be confined till she deposited her eggs. The bodies of both male and female were to be examined for corpuscles, and the eggs of those found absolutely free from taint were preserved for similar "cellular" treatment in the following year. By this laborious and painstaking method it has been found possible to re establish a healthy stock of valuable races from previously highly infected breeds. The rearing of worms in small educations under special supervision has been found to be a most effective means of combating pebrine. In the same way the rearing of worms for graine in the open air, and under as far as possible natural conditions, has proved equally valuable towards the development of a hardy, vigorous, and untainted stock. The open air education was originally proposed by Dr Chavannes of Lausanne, and largely carried out in the canton of Vaud by M Roland, who reared his worms on mulberry trees enclosed within "manchons" or cages of wire gauze and canvas. The insects appeared quickly to revert to natural conditions, the moths brought out in open air were strongly marked, lively, and active, and eggs left on the trees stood the severity of the winter well, and hatched out successfully in the following season. M Roland's experience demonstrated that not cold but heat is the agent which saps the constitution of the silkworm and makes it a ready prey to disease.

Wild Silks.—The ravages of pebrine and other diseases had the effect of attracting prominent attention to the numerous other insects, allies of the mulberry silkworm, which spin serviceable cocoons. It had been previously pointed out by Captain Hutton, who devoted great attention to the silk question as it affects the East Indies, that at least six species of *Bombyx*, differing from *B mori*, but also mulberry-feeding, are more or less domesticated in India. These include *B textor*, the boro-pooloo of Bengal, a large species having one generation yearly and producing a soft flossy cocoon, the Chinese monthly worm, *B sinensis*, having several generations, and making a small cocoon, and the Madrasi worm of Bengal (*B croesi*), the Dassee or Desi worm of Bengal (*B fortunatus*), and *B arracanensis*, the Burmese worm,—all of which yield several generations in the year and form reelable cocoons. Besides these there are many other mulberry feeding *Bombycidæ* in the East, principally belonging to the genera *Theophila* and *Ocinara*, the cocoons of which have not attracted cultivators. The moths yielding wild silks which have obtained most attention belong to the extensive and handsome family *Saturnidæ*. The most important of the species at the present time is the Chinese tussur or tasar worm, *Antheræa pernyi* (figs 7, 8), an oak-feeding species, native of Mongolia, from which is derived the greater part of the so-called tussur silk now imported into Europe. Closely allied to this is the Indian tussur moth (fig 9) *Antheræa mylitta*, found throughout the whole of India feeding on the bher tree, *Zizyphus jujuba*, and on many other plants. It yields a large compact cocoon (fig 10) of a silvery grey colour, which Mr Thomas Wardle of Leek, who has devoted a great amount of attention to the wild silk question, has succeeded in reeling. Next in promising qualities is the muga or moonga worm of Assam, *Antheræa assama*, a species to some extent domesticated in its native country. The yama-mai worm of Japan, *Antheræa* (*Samia*) *yama mai*, an oak feeder, is a race of considerable importance in Japan, where it was said to be jealously guarded against foreigners. Its eggs were first sent to Europe by M Duchêne du Bellecourt, French consul general in Japan in 1861, but early in March following they hatched out, when no leaves on which the larvæ would feed were to be found. In April a single worm got oak-buds, on which it throve, and ultimately spun a cocoon whence a female moth issued, from which M Guérin Méneville named and described the species. A further supply of eggs was secretly obtained by a Dutch physician M Pompe van Meedervoort in 1863, and, as it was now known that the worm was an oak-feeder, and would thrive on the leaves of European oaks, great results were anticipated from the cultivation of the yama-mai. These expectations, however, for various reasons, have been disappointed. The moths hatch out at a period when oak leaves are not ready for their feeding, and the silk is by no means of a quality to compare with that of the common mulberry worm. The mozankoorie moth of the Assamese, *Antheræa mezankooria*, yields a valuable cocoon, as does also the Atlas moth, *Attacus atlas*, which has an omnivorous larva found throughout India, Ceylon, Burmah, China, and Java. The Cynthia moth, *Attacus cynthia*, is domesticated as a source of silk in certain provinces of China, where it feeds on the *Ailanthus glandulosa*. The eria or arrindi moth of Bengal and Assam, *Attacus ricini*, which feeds on the castor-oil plant, yields seven generations yearly, forming loose flossy orange red and sometimes white cocoons. The ailanthus silkworm of Europe is a hybrid between *A cynthia* and *A ricini*, first obtained by Guérin Méneville, and now spread through many silk-growing regions. These are only a few of the moths from which silks of various usefulness can be produced, but none of these presents qualities, saving perhaps cheapness alone, which can put them in competition with common silk.

Physical and Chemical Relations of Silk.

Common cocoons enclosing chrysalides weigh each from 16 to 50 grains, or say from 300 to 600 of small breeds and from 270 to 300 of large breeds to the lb. One-seventh of this weight is pure cocoon, and of that not more than one-half is obtainable as reeled silk, the remainder consisting of surface floss and of hard gummy husk or "knub." The total length of double thread or "bave" which the silk-worm winds into its cocoon may amount to 4000 yards, the quantity reelable therefrom rarely exceeds 900 yards, and may range from 330 to 650 yards. It is found that the reelable fibre is as a rule thickest and strongest at the middle portion, tapering down very notably towards each extremity. In 1885 Mr T Wardle of Leek showed by an elaborate series of measurements that the transverse section of common silk double thread or bave measures on the average $\frac{1}{900}$ to $\frac{1}{1000}$ in at the thinnest and from $\frac{1}{700}$ to $\frac{1}{400}$ in at the thickest part, and in some instances the middle was one-third thicker, stronger, and more elastic than the ends. As a great deal of silk remains on the husk after reeling, it is obvious that the thread last emitted by the silkworms on the inner wall of the cocoons must be of extreme tenuity. The silk of the various species of *Antheræa* and *Attacus* is also thicker and stronger at the centre of the reeled portion than towards its extremities, but the diameter is much greater

than that of common silk, and the filaments under the microscope (fig 11) present the appearance of flat bands, the exudation from the two spinnerets being joined at their flat edges On this account the fibres of tussur silk tend to split up into fine fibrillæ under the various preparatory processes in manufacturing, and its riband structure is the cause of the glassy lustre peculiar to the woven and finished fibres

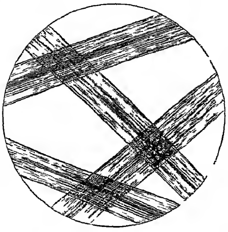

Fig 11 —Microscopic appearance of Silk of Chinese Tussur

Silk fibre consists essentially of a centre or core of fibroin, with a covering of sericin or silk albumen, and a little waxy and colouring matter Fibroin, which is analogous to horn, hair, and like dermal products, constitutes about 66 per cent of the entire mass, and has a composition represented by the formula $C_{15}H_{23}N_5O_6$ It has the characteristic appearance of pure silk,—a brilliant soft white body with a pearly lustre,—insoluble in water, alcohol, and ether, but it dissolves freely in concentrated alkaline solutions, mineral acids, strong acetic acid, and in ammoniacal solution of oxide of copper Sericin, which constitutes the gummy covering (Fr *grès*) of the fibre, is a gelatinous body which dissolves readily in warm soapy solutions, and in hot water, in which on cooling it forms a jelly with even as little as 1 per cent of the substance It is precipitated from hot solutions by alcohol, falling as a white powder Its formula is $C_{15}H_{25}N_5O_8$ According to the researches of P Bolley, the glands of the silkworm contain semi-liquid fibroin alone, and it is on exposure to the air that the surface is acted on by oxygen, transforming the external pellicle into the more soluble form of sericin Silk is highly hygroscopic, taking up as much as 30 per cent of water without feeling perceptibly damp It is a most perfect non-conductor of electricity, and in its dry state the fibres frequently get so electrically excited as to seriously interfere with their working, so that it becomes necessary to moisten them with glycerin or soapy solutions Silk is readily distinguished from wool and other animal fibres by the action of an alkaline solution of oxide of lead, which darkens wool, &c , owing to the sulphur they contain, but does not affect silk, which is free from that body Again, silk dissolves freely in common nitric acid, which is not the case with wool From vegetable fibres silk is readily distinguished by the bright yellow colour it takes from a solution of picric acid, which does not adhere to vegetable substances The rod-like appearance of silk and its absence of markings under the microscope are also easily recognizable features of the fibre

Silk Manufacture

Here we must distinguish between the reeled silk and the spun or waste silk manufactures The former embraces a range of operations peculiar to silk, dealing as they do with continuous fibres of great length, whereas in the spun silk industry the raw materials are treated by methods analogous to those followed in the treatment of other fibres It is only floss, injured and unreelable cocoons, the husks of reeled cocoons, and other waste from reeling, with certain wild silks, which are treated by the spun silk process, and the silk thereby produced loses much of the beauty, strength, and brilliance which are characteristic of the manufactures from reeled silk

Filature or Reeling —When the cocoons have been gathered the chrysalides they contain are killed either by dry heat or by exposure to steam. All cocoons stained by the premature death of the chrysalides (*chiques*), pierced cocoons, double cocoons, and any from other causes rendered unreelable, are put aside for the spun-silk manufacture Then the uninjured cocoons are by themselves sorted into classes having similar shades of colour, size, and quality of fibre This assortment is of great consequence for the success of the reeling operations, as uniformity of quality and evenness and regularity of fibre are the most valuable features in raw silk The object of reeling is to bring together the filaments (*bave*) from two or more (generally four or five, but sometimes up to twenty) cocoons, and to form them into one continuous, uniform, and regular strand, which constitutes the "raw silk" of commerce To do this, the natural gum of the cocoons which holds the filaments together must be softened, the ends of the filaments of the required number of cocoons must be caught, and means must be taken to unwind and lay these filaments together, so as to form a single uniform rounded strand of raw silk As the reeling proceeds the reeler has to give the most careful attention to the thickness of the strand being produced, and to introduce new cocoons in place of any from which the reelable silk has become exhausted In this way a continuous uniform fibre or strand of raw silk of indefinite length is produced The apparatus used for these purposes in some localities is of a very primitive kind, and the reeling being uneven and lumpy the silk is of inferior quality and low value With comparatively simple appliances, on the other hand, a skilled reeler, with trained eye and delicate touch, can produce raw silk of remarkably smooth and even quality According to the method commonly adopted in North Italy and France the cocoons are for a few minutes immersed in water a little under the boiling point, to which a small quantity of alkali has been added A girl with a small hand brush of twigs keeps stirring them in the water till the silk softens, and the outer loose fibres (floss) get entangled with the twigs and come off till the end of the main filament (*maître brin*) is found These ends being secured, the cocoons are transferred to a basin or tray containing water heated to from 75° to 85° Fahr , in which they float while the silk is being reeled off If the water is too cold the gum does not soften enough and the cocoons rise out of the basin in reeling, if it is too hot the cocoons collapse and fall to the bottom The ends of the requisite number of filaments being brought together, they are passed through an eyelet or guide, and similarly another equal set are passed through a corresponding guide The two sets of filaments are then crossed or twisted around each other several turns as if to make one thread, after which they are separated and passed through separate guides to the reel round which they are separately wound When a large number of cocoons are to be combined into one strand they may be reeled from the tray in four sets, which are first crossed in pairs, then combined into two, and those two then crossed and afterwards combined into a single strand The object of crossing (*croissage*) is to round, smooth, and condense the separate filaments of each set into one strand, and as the surface of the filaments are gummy and adhesive it is found on drying that they have agglutinated into a compact single fibre of raw silk In the most approved modern filatures there is a separate cocoon boiler (*cuiseuse*), an oblong tank containing water boiled by steam heat In these the cocoons are immersed in rectangular perforated boxes for about three minutes, when they are transferred to the beating machine (*batteuse*), an earthenware trough having a perforated false bottom through which steam keeps the water at a temperature of from 140° to 160° In this water the cocoons are kept stirring by small brushes rotated by mechanical means, and as the silk softens the brushes gradually rise out of the water, bringing entangled with them the loose floss, and thereby revealing the main filament of each cocoon The cocoons are next, in sufficient number, transferred to the reeler's tray (*bacinella*), where the water is heated to about 120° From the tray the filaments are carried through a series of porcelain and glass eyelets, so arranged that the strand returns on itself, two portions of the same strand being crossed or intertwisted for rounding and consolidation, instead of the croissage of two separate strands as in the old method The reel to which the raw silk is led consists of a light six-armed frame, enclosed within a wooden casing having a glass frame in front, the enclosure being heated with steam-pipes To keep the strands from directly overlaying each other and so adhering, the last guide through which the silk passes has a reciprocating motion whereby the fibre is distributed within certain limits over the reel A sectional view of the reeling apparatus and arrangements—now in common use in Italy—is shown in fig 12

Throwing —Raw silk, being still too fine and delicate for ordinary use, next undergoes a series of operations called throwing, the object of which is to twist and double it into more substantial yarn The first operation of the silk throwster is winding He receives the raw silk in hanks as it is taken from the reel of the filature, and putting it on a light reel of a similar construction,

called the swifts, he winds it on bobbins with a rapid reciprocating motion, so as to lay the fibre in diagonal lines These bobbins are then in general taken to the first spinning frame, and there the single strands receive their first twist, which rounds them, and prevents the compound fibre from splitting up and separating when, by the subsequent scouring operations, the gum is removed

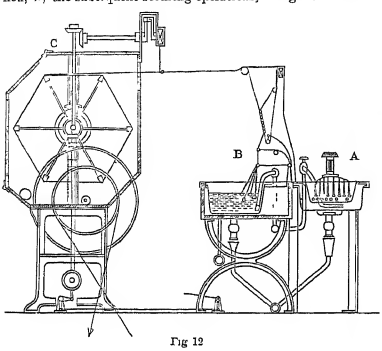

Fig 12

which presently binds them into one Next follows the operation of cleaning, in which the silk is simply reeled from one bobbin to another, but on its way it passes through a slit which is sufficiently wide to pass the filament but stops the motion when a thick lump or nib is presented In the doubling, which is the next process, two or more filaments are wound together side by side on the same reel, preparatory to their being twisted or thrown into one yarn Bobbins to the number of strands which are to be twisted into one are mounted in a creel on the doubling frame, and the strands are passed over smooth rods of glass or metal through a reciprocating guide to the bobbin on which they are wound Each separate strand passes through the eye of a faller, which, should the fibre break, falls down and instantly stops the machine, thus effectually calling attention to the fact that a thread has failed The spinning or throwing which follows is done on a frame with upright spindles and flyers, the yarn as it is twisted being drawn forward through guides and wound on revolving bobbins with a reciprocating motion From these bobbins the silk is reeled into hanks of definite length for the market Numerous attempts have been made to simplify the silk-throwing by combining two or more operations on one machine, but not as yet with much success

According to the qualities of raw silk used and the throwing operations undergone the principal classes of thrown silk are—(1) "singles," which consist of a single strand of twisted raw silk made up of the filaments of eight to ten cocoons, (2) tram or weft thread, consisting of two or three strands of raw silk not twisted before doubling and only lightly spun (this is soft, flossy, and comparatively weak), (3) organzine, the thread used for warps, made from two and rarely three twisted strands spun in the direction contrary to that in which they are separately twisted Silks for sewing and embroidery belong to a different class from those intended for weaving, and thread makers throw their raw silks in a manner peculiar to themselves

Numbering of Silk —The numbering (*titrage*) of raw and thrown silks, by which the size or fineness of the yarn is stated, is determined by constant length with variable weight, whereas other yarns are indicated by constant weight with variable length The original standard length was 9600 Paris ells=11,400 metres, the number being the weight in deniers of 24 grains=1 275 grammes This still remains the most common standard, and in practice the number is ascertained by the weight in grains, $\frac{1}{24}$ of a denier of a hank containing 476 metres (properly 475$\frac{5}{8}$ metres=400 Paris ells) According to this standard a single cocoon filament weighs 2 to 3 5 deniers, a 3 to 4 cocoon strand ranges from 7 to 10 deniers, and a 16 or 17 cocoon strand is numbered from 48 to 52 Spun silk is numbered on a different principle In the United Kingdom it is determined by the cotton standard, the number of skeins of 840 yards per ℔ In Continental manufacturing centres generally the standard is the number of écheveaux of 500 metres contained in a half kilogramme, or, more simply, the number of kilometres per kilogramme According to the resolution of the international congress for promoting uniformity in the numbering of yarns, held at Vienna in 1873 and at Brussels in 1874, the grade of silk ought now to be expressed by ten times the number of grammes given by a hank of 1000 metres

These methods of indicating grades of silk give, however, only the most imperfect idea as to the quality of the thread, and specially they convey no information as to uniformity of diameter and strength To test the raw material in respect of uniformity a most ingenious American invention, the serigraph, has been introduced, and is now largely used The serigraph has two reels mounted on one spindle, or at least so arranged that they make precisely the same number of revolutions The reels are covered with india-rubber, and No 2 is 3 per cent greater in circumference than No 1 The silk to be tested is placed on No 1 reel and from that wound on No 2, which, being of greater diameter, puts a certain amount of strain on the elastic fibre In passing from the one reel to the other the silk is carried over an agate hook attached to the bob of a pendulum, so that the strain on the yarn is communicated to the pendulum The strain caused by the 3 per cent tension of course varies with the strength of the yarn to which it is applied, being greater with increased strength and thickness, and falling away just as the strength of the yarn decreases Thus the yarn in passing over the agate hook keeps by its tension the pendulum at one particular position while it is uniform, but when it increases in strength it raises the pendulum higher, and when it becomes weaker the pendulum falls To the extremity of the pendulum is attached a pencil or marker, which traces on a web of paper, travelling at a rate in fixed proportion to the winding, the changes in the pendulum, and thus is obtained a graphic record in a most distinct manner of every variation in the strength of the silk The precise spot where any imperfection occurs is shown on the tracing, which thus not only absolutely certifies the quality of the yarn, but also automatically measures the quantity reeled

Conditioning —Silk in the raw and thrown state, as has already been pointed out, absorbs a large amount of moisture, and may contain from 20 to 30 per cent of water without being manifestly damp As it is largely sold by weight it becomes necessary to ascertain its condition in respect of absorbed water, and for that purpose official conditioning houses are established in all the considerable centres of silk trade In these the silk is tested or conditioned, and a certificate of weight issued in accordance with the results The silk is for four hours exposed to a dry heat of 230° Fahr , and immediately thereafter weighed To the weight 11 per cent is added as the normal proportion of water held by the fibre

Scouring —Up to this point the silk fibre continues to be comparatively lustreless, stiff, and harsh, from the coating of albuminous matter (gum or *grès*) on its surface As a preliminary to most subsequent processes the removal of the whole or some portion of this gum is necessary by boiling off, scouring, or *decreusage* To boil off say 300 ℔ of thrown silk, about 60 ℔ of fine white soap is shred, and dissolved in about 200 gallons of pure water This solution is maintained at a heat of 195°, and in it the hanks of raw silk are immersed, hung on a wooden rod, the hanks being continually turned round so as to expose all portions equally to the solvent influence of the hot solution After being dried, the hanks are packed in linen bags and boiled for three hours in a weaker soapy solution, then washed out in pure warm water and dried in a centrifugal hydro extractor According to the amount of gum to be boiled off the soap solutions are made strong or weak, but care has to be exercised not to overdo the scouring, whereby loss of strength, substance, and lustre would result For some purposes—making of gauzes, crapes, flour-bolting cloth, and for what is termed "souples"—the silk is not scoured, and for silks to be dyed certain dark colours half-scouring is practised The perfect scouring of French silks removes from 25 to 27 per cent of their weight, and Chinese silks lose from 30 to 31 per cent Scouring renders all common silks, whether white or yellow in the raw, a brilliant pearly white, with a delicate soft flossy texture, from the fact that the fibres which were agglutinated in reeling, being now degummed, are separated from each other and show their individual tenuity in the yarn Silks to be finished white are at this point bleached by exposure in a closed chamber to the fumes of sulphurous acid, and at the close of the process the hanks are washed in pure cold water to remove all traces of the acid

Spun Silk Manufacture —The materials of the spun silk trade are—(1) the floss or loose outer fibres which surround ordinary cocoons, (2) the remains of cocoons after the reelable silk has been removed, (3) waste from throwing processes and from all the stages through which reeled silk passes in manufacturing, (4) unreelable cocoons, *i e* , those which are pierced, torn, or cut, stained by dead chrysalides, &c , and double cocoons, (5) cocoons of various wild silks, which are either unreelable or most profitably worked by carding The waste spinners' first duty is to bring these diverse materials into uniform fibrous condition for spinning In dealing with cocoons and cocoon husks, the fibres, which are gummed together into a dense compact mass, must be so washed, softened, and freed from each other that they can be readily teased and torn into a tow-like mass For this purpose they are washed with a strong hot soap solution in a revolving washing machine, in which they are continuously subjected for three or four hours to

the action of falling stampers From this treatment they are taken to the cold-water washing machine, where they are treated with a continuous spray of pure water whilst revolving in the tub under the action of falling stampers, as in the hot-water machine Next the cocoons are rinsed in a spray of pure water, then the moisture is expelled in a hydro extractor, and so, thoroughly degummed and softened, they are allowed to dry For further treatment they are damped with a sprinkling of weak solution of Marseilles soap, then beaten either with the hand or by means of a machine This machine has a series of leather straps attached to an endless band, which by its rapid revolution causes the straps to hit with a quick whipping stroke against the surface of a revolving tray on which are placed the washed cocoons The beating serves to free the fibres fully from each other, and expels in the form of a fine dust the remains of chrysalides from the interior of the cocoons It now remains only by the operation of the cocoon opener to tease out and separate the fibres into a kind of lap The cocoon-opener is a modified carding machine, the drum or cylinder of which is covered with strong card teeth On this drum the fibres collect as they are opened and teased out, and when the teeth are full the lap so formed is stripped off by the attendant The silken fibres are now ready for the operations preparatory to spinning

To bring raw waste other than cocoons to this point a different series of operations are necessary The removal of the gum is first usually effected by a process of fermentation or maceration instead of washing with soap, whereby a great saving of soap is secured Into a large tank a quantity of waste is packed, and soaked with a weak soapy solution which is maintained by steam at about 170° The tank is closed over, and in the course of a few days fermentation begins, and according to circumstances is allowed to go on from two to three weeks From time to time proof samples are withdrawn to observe the progress of the rotting, as over fermentation would result in the same injury which arises from over-scouring, —weakness of fibre, loss of lustre, and waste of substance By maceration the silk loses from 20 to 30 per cent of its weight From the maceration vat the silk is conveyed to the hot water washing machine, where with a weak soapy solution it is washed under the influence of stampers for about five minutes Great care is necessary to prevent the silk from cooling before this washing, as thereby the macerated slime would form an almost insoluble deposit on the silk fibre From the hot soap solution the silk is taken to the cold-water machine, where, with the aid of stampers, it undergoes a thorough and prolonged washing After being hung over hurdles to dry it is sprinkled with a weak solution of Marseilles soap, and then dried by means of the hydro-extractor and subsequent exposure in a heated well-ventilated chamber At this point both cocoon waste, as already described, and floss waste are in the same condition

The spinner has now to deal with a mass of entangled fibres of all lengths, which he must render even, parallel, and comparatively uniform in length before it can be spun The fibres are slightly damped with a weak soapy solution and taken to a filling drum, which consists of a large cylinder having set into it, parallel with its axis, from twelve to twenty rows of strong steel spikes A feeding apron of cloth covered with card-teeth is provided to the machine, and, as the fibre is carried forward towards the drum, a similar card-teeth-covered band travels close over the surface of the apron, so that the fibre is presented to the drum from between two sets of card-teeth The rows of spikes catch the fibre as presented to them, draw it through the card-teeth, and carrying it with them lap it around the drum in regular combed out order When the spikes are sufficiently filled, the lap is cut at each set of spikes, and so stripped from the drum it forms a definite number of "stricks," of the breadth of the drum itself and the length of the space between the sets of spikes These stricks are caught in wooden clamps or "books," which are fastened in the bed of the flat dressing frame Over them an endless band travels, having on it at short intervals belts of heckle-teeth, called combs, which comb out doubled and short fibres, and, acting first on one end of the strick and next on the other, leave the silk in the condition of beautifully parallel and comparatively uniform flakes The product of the first combing, called the first draft, is the longest and purest fibre The material combed out as it fills the comb teeth is caught in books, and when itself combed out forms second drafts, shorter and less valuable than the first, and again the combings of second drafts, when combed, form third drafts still shorter In this way five or six separate drafts or combings from the original lap are obtained, all increasingly short and impure The final combed waste is treated by a different process for making noil or bourette yarn

A new form of dressing-frame is now coming into favour, in which the stricks of silk have their ends rolled round wooden rods, and so secured between wooden clamps on the surface of a huge cylinder which revolves so slowly that the attendant can change and fill the clamps as the drum goes round In its revolution the exposed portion of the silk is first combed on one side by a rapidly revolving card-toothed cylinder, from which it passes onwards to meet a second similar cylinder revolving in a contrary direction, which combs the opposite side In the second revolution of the cylinder the portion of the strick which was previously wound on the rod is similarly combed on both sides, and thus the entire strick is rendered smooth and parallel

The above is an outline of the ordinary process of preparing silk waste as practised in Switzerland and in the United Kingdom, &c, the range of machines being that of Messrs Greenwood and Batley of Leeds In the great Manningham silk mills at Bradford, Mr S C Lister, the well known inventor of wool-combing machinery, while using machinery of the class described, treats by patented methods peculiar to himself a great proportion of his material According to his original process, scoured, teased, and opened waste is first drawn into a lap on a screw gill box These laps, containing all the fibres both long and short, are taken to the circular nip combing machine, where the "top" of long fibre is drawn out as a continuous sliver and separated from the "noil" or short fibre, which according to its length is delivered at separate points In his most recent mode of working, Mr Lister forms his waste into a broad lap on the large drum of a kind of carding engine, the drum being stripped when its teeth are filled with the prepared fibre These laps are laid on the feeding table of a machine which has an oscillating or rocking filling head At each oscillation the end of the lap in front of the table is "filled" on to a row of heckle-teeth parallel with it, and just as the feeding-table recedes a knife comes down between the heckles and the table with a sudden stroke and separates from the lap such fibres as have been placed or filled on to the heckle-teeth These heckle-teeth in the meantime, being fixed on an endless band, are continuously moving forward in a horizontal direction parallel with the front of the feeding machine, and a set of three such machines place a portion of their laps on to the heckle-teeth in their progress, thus filling the teeth with a fair "bite" of silk Immediately the heckles have passed the machines, the silk is caught and cleaned off the endless comb by pairs of endless revolving nips rising from under and descending from above, and between these nips the stricks are carried forward in the same horizontal line in which they travelled on the heckle-teeth, which here begin their return journey to be again filled The stricks in their progress are now submitted to the combing action of revolving card-covered cylinders and card covered cloth Half way on in its horizontal path a second set of endless nips seize the combed portion of the silk, the uncombed portion held between the first set is released, and it in its turn is submitted to the combing action of cylinders and endless card-bands In the end the fully dressed stricks of silk fall on a narrow feeding cloth, which has a combined reciprocating and forward motion, so that the material is spread with the utmost regularity and evenness It passes through a set of screw gills, and is delivered into cans in the form of a most uniform and equal continuous sliver The great advantage of these machines is the small amount of tending they require and the large quantity of dressed silk they deliver with unerring regularity

The spinning proper of dressed waste is done precisely as in the spinning of flax yarn The flakes are formed into a broad sliver on the spreading frame, and further attenuated and equalized on the set frame and the drawing frame, from which last the silk passes to the roving frame, where it receives its first preliminary twist and is sufficiently condensed to wind on a bobbin The rovings are finally elongated and spun on the ordinary spinning frame, and for twisting into thread the yarns in two, three, or more strands are wound together on the doubling frame, and finally twisted as in dealing with raw silk spinning

Spun silk, as it comes from the spinning frame, shows a good many nibs and irregularities and some roughness of surface To remove these it is wound from one bobbin to another over an improving or cleaning and gassing machine, which consists of a frame having attached to it a number of small cone rollers, around which the yarn passes in a way which makes the entering portion of the thread rub against the portion running off In this way, with considerable rubbing, the yarn cleans itself, and in its course over the rollers it rapidly passes through a gas flame, which singes off the fine projecting fibres, leaving the yarn clean, round, and compact It is submitted to a further examination by eye and hand after being wound into hanks, and some yarns are finally dressed with albumen and gum solutions

In the combing of waste silk as much as from 25 to 30 per cent of waste in a second degree arises, much of which is very short, full of nibs and dust From this a lower quality of yarn is spun, called noil yarn, and on the Continent "bourette" silk, to distinguish it from the "floret" silk made from first waste On account of the shortness of staple it is worked up by machinery different from that used in the floret manufacture, being prepared by carding, and combed out with a modification of Heilmann's or Lister's combing machines The finished noil yarn is very lumpy, and requires severe improving and singeing.

Spun silk lacks the smoothness, brilliance, and strength of raw silk yarn, but still it is an extremely valuable and useful material,

and its comparative cheapness gives it an important place among the products of textile industry. It is used very largely in mixed fabrics, as well as for the cheaper ribbons, velvets, hat plush, and for many other silk woven fabrics, as also in the hosiery and glove trades and for sewing, knitting, and embroidering yarns.

Silk Weighting.—Into the dyeing of silk it is not here necessary to enter, except in so far as concerns a nefarious practice, carried on in dye-houses, which has exercised a most detrimental influence on the silk trade. Silk, we have seen, loses about one-fourth of its weight in scouring. To obviate that loss it has long been the practice to dye some dark silks "in the gum," the dye combining in these cases with the gum or gelatinous coating, and such silks are known as "souples." Both in the gum and in the boiled-off state silk has the peculiar property of imbibing certain metallic salts largely and combining very firmly with them, the fibre remaining to external appearance undiminished in strength and lustre, but much added to in size and weight. Silk in the gum, it is found, absorbs these salts more freely than boiled off, so to use it for weighting there are these great inducements—a saving of the costly and tedious boiling-off, a saving of the 25 per cent. weight which would have disappeared in boiling, and a surface on which much greater sophistication can be practised than on scoured silk. In dyeing a silk black a certain amount of weight must be added, and the common practice in former times was to make up on the silk what was lost in the scouring. Up to 1857 the utmost the dyer could add was "weight for weight," but an accidental discovery that year put dyers into the way of using tin salts in weighting with the result that they can now add 40 oz. per lb to scoured silks, 120 oz. to souples, and as much as 150 oz. to spun silks, and yet call these compounds "silk." Not only so, but the use of tin salts, especially stannic chloride, $SnCl_4$, enables dyers to weight all colours the same as black. In his "Report on English Silk Industry" to the Royal Commission on Technical Instruction (1885) Mr Thomas Wardle of Leek says:—

"Colours and white of all possible shades can very easily be imparted to this compound of silk and tin, and this method is becoming extensively used in Lyons. Thus weighting, which was until recently thought to apply only to black silks, and from which coloured silks were comparatively free, is now cheapening and deteriorating the latter in pretty much the same ratio as the former. Thus the proto- and per-salts of iron, as well as the proto- and per-salts of tin, including also a large variety of tannin, sumac, divi divi, chestnut, valonia, the acacias (*Areca Catechu* and *Acacia Catechu* from India), from which are obtained cutch and gambier, &c., are no longer used solely as mordants or tinctorial matters, but mainly to serve the object of converting the silk into a greatly expanded fibre, consisting of a conglomeration of more or less of these substances."

Sugar also is employed to weight silk. On this adulterant Mr Wardle remarks:—

"With a solution of sugar, silk can have its weight augmented from 1 oz. to 3 oz. per lb. I am not quite sure that this method of weighting was not first used by the throwsters, as sugar is known to have been used for adulterating and loading gum silk for a very long time, and then the idea was afterwards applied to silk after the dyeing operations. It is much resorted to for weighting coloured silks by dyers on the Continent, and, though a very clumsy method, no substitute has been found so cheap and easy of application. Bichloride of tin, having chemical affinity for silk fibre, bids fair to extinguish the use of sugar, which, from its hygrometric qualities, has a tendency to ruin the silk to which it is applied, if great care be not taken to regulate the quantity. There is not the slightest use or excuse for the application of sugar, except to cheapen the silk by about 15 to 20 per cent."

Wild Silk Dyeing.—Among the disadvantages under which the silks of the wild moths long laboured one of the most serious was the natural colour of the silks, and the extreme difficulty with which they took on dyes, specially the light and brilliant colours. For success in coping with this difficulty, as well as in dealing with the whole question of the cultivation and employment of wild silks, the unwearying patience and great skill of Mr Thomas Wardle of Leek deserve special mention here. The natural colour of tussur silk is a greyish fawn, and that shade it was found impossible to discharge by any of the ordinary bleaching agents, so as to obtain a basis for light and delicate dyes. Moreover, the chemical character of the tussur silk differs from that of the mulberry silk, and the fibre has much less affinity for tinctorial substances, which it takes up unevenly, requiring a large amount of dye stuffs. After protracted experimenting Mr Wardle was able in 1873 to show a series of tussurs well-dyed in all the darker shades of colour, but the lighter and bright blues, pinks, scarlets, &c., he could not produce. Subsequently the late M. Tessie du Motay found that the fawn colour of natural tussur could be discharged by solution of permanganate of potash, but the oxidizing action was so rapid and violent that it destroyed the fibre itself. Gentler means of oxidation have since been found for bleaching tussur to a fairly pale ground, but the dyeing of light colours cannot yet be said to be a commercial success. The silk of the eria or castor oil worm (*Attacus ricini*) presents the same difficulties in dyeing as the common tussur. A portion of the eria cocoons are white, while the others are of a lively brown colour, and for the dyeing of light colours the latter require to undergo a bleaching process. The silk takes up colour with difficulty from a strong vat, and is consequently costly to dye. Moonga silk from *Antheraea assama* has generally a rather dark brown colour, but that appears to be much influenced by the leaves on which the worm feeds, the cocoons obtained on the champaca tree (*Michelia champaca*) giving a fine white fibre much valued in Assam. The dark colours are very difficult to bleach, but the silk itself takes dye colours much more freely and evenly than either tussur or eria silk.

Trade and Commerce

About the commencement of this century the chief silk-producing regions of the world were the Levant (including Broussa, Syria, and Persia), India, Italy, and France, the two first named sending the low-priced silk, the other two the fine qualities. Between 1840 and 1850, after the opening of trade with China, large quantities of silk were sent from the northern port of Shanghai, and afterwards also from the southern port of Canton. The export became important just at the time when disease in Europe had lessened the production on the Continent. This increased production of medium silk, and the growing demand for fine sorts, induced many of the cocoon-growers in the Levant to sell their cocoons to Europeans, who reeled them in Italian fashion under the name of "Patent Brutia," thus producing a very fine valuable silk. In 1857 commenced the importation of Japan silk, which became so fierce a competitor with Bengal silk as gradually to displace it in favour; and recently the native silk reeled in Bengal has almost ceased to be made, only the best European filatures, produced under the supervision of skilled Europeans, now coming forward.

China and Japan, both of which contribute so largely to the supplies that appear in European and American statistics, only export their excess growth, silk weaving being carried on and native silk worn to an enormous extent in both countries. The other Asiatic exporting countries also maintain native silk manufactures which absorb no inconsiderable proportion of their raw material. The silk production of the world, including only the amount exported from these Oriental countries, amounts on an average to from 20,000,000 lb to 25,000,000 lb yearly; but the crop is subject to great variations.

The supply available for European consumption during recent years was thus stated, in bales of 100 lb, by the *Moniteur des Soies* of Lyons, 25th July 1885:—

	1851-55	1875-76	1876-77	1877-78	1878-79	1879-80	1880-81	1881-82	1882-83	1883-84	1884-85	1885-86 (estimates)

While these tables indicate remarkable fluctuation of supply they show generally that Asiatic countries, besides supplying their own considerable demands, send to Europe fully one half of the whole silk consumed in Western manufactures China stands first as a silk-producing country, yielding about 35 per cent of the entire supply, the whole produce of Italy amounts to nearly the same proportion, the exports of Japan account for about 12 per cent of the annual supply, while in recent years France and the Levant are credited with about equal proportions

In the United Kingdom the trade in raw silks has been in a condition of decline for a considerable number of years, much of the Chinese and Eastern produce which formerly came to London now being unshipped at Marseilles, and sold in the Lyons market, which has become the leading silk mart But there is a very steady and continuous expansion in the demand for waste silks and cocoons for the spun silk trade The following figures show the official annual returns of silk imports since 1860, the date of the French commercial treaty, which exposed many branches of the trade to severe and fatal competition —

Years	Raw Silk	Knubs or Husks of Silk and Waste	Thrown Silk	Silk Manufactures
	lb	Cwts	lb	£

In the manufacture of silken fabrics France occupies the most important position among the nations Not only is the whole of the raw silk produced in France worked up within the country, but a very considerable proportion of that imported from the Levant and from Asia passes into the hands of the French manufacturers In all, between 8,000,000 and 9,000,000 lb of raw silk are on an average manufactured into various textures in France Lyons is the headquarters of the trade, and, if the surrounding regions be included, employment is given to about 120,000 looms,—20,000 of which are driven by power,—principally in the production of dress silks, plain and figured, and in other heavy silken fabrics, and at St Étienne and St Chamond in the ribbon trade There are also important manufactures of silk at Calais, St Pierre les Calais (tulles and passementerie), Paris, Nîmes, Tours, Avignon, and Roubaix Next to France in the extent and value of manufactures comes Germany, where the principal seat of the silk trade is at Crefeld, nearly one half of the whole production of the empire being manufactured there The looms of Crefeld and the district it controls numbered in 1881 about 33,000, and the trade was flourishing and expansive The manufacture of union velvets is the special feature of the industry, about one half of the looms being devoted to that textile, but Crefeld controls also a large trade in union satins, and pure silk broad goods and ribbons of all kinds The whole value of its trade amounted in 1881 to almost £4,000,000, one-fourth of which found a market in England, and about a quarter of a million went to France The other principal centres of the silk trade, all in Rhenish Prussia, are Viersen, Barmen, Elberfeld, and Muhlheim Third on the list of Continental producers is Switzerland, where Zurich takes the lead with broad goods (failles, armures, satins, serges, &c), and Basel rivals St Etienne in the ribbon trade The number of looms throughout the country is estimated at 40,000, of which 4000 are power-looms Italy—the early home of the silk trade, the land of the gorgeous velvets of Genoa and the damasks and brocades of mediæval Sicily, Venice, and Florence—has fallen from its high estate, and now employs not more than 30,000 looms, the centre of greatest activity being at Como, but Genoa still makes velvets, and the brocades of Venice are not a thing of the past In Austria the silk trade has found its principal development in Vienna and its immediate neighbourhood, the number of looms throughout the entire empire being estimated at from 15,000 to 20,000, of which 2000 are power-looms In Russia there is, with a growing cultivation of raw silk, a considerable and increasing manufacture, the special feature of which is the weaving at Moscow of gold and silver tissues and brocades for sacerdotal use, and for traffic with Central Asia

In the United Kingdom all the silk industries—these depending on spun silk alone excepted—have been in a depressed and declining condition ever since 1860 The principal silk manufacturing towns of England have been Coventry, Macclesfield, Congleton, Leek, Derby, London (Spitalfields), Manchester, Middleton, and Nottingham, and it is estimated that at the best period not fewer than 150,000 looms found employment in the trade In 1872 that number was reduced to 65,000, of which 12,500 were power-looms Spitalfields in her best days (about 1825) kept 24,000 hand-looms occupied, now there are not more than 1200 Manchester once had about 20,000 looms weaving silk, now there are not 6000 so employed When the French treaty of 1860 came into operation Coventry had about 9000 looms, principally employed in ribbon weaving, now not more than one-fourth of that number are in operation The cause of several of these severe changes is to be found in the introduction of the factory system of working and the extension of power-loom weaving, which crushed out domestic weaving, the original form of the silk industry, but undoubtedly also the English manufacturers were beaten in the battle of free competition brought on by the French treaty On the other hand, the remarkable development of the

Silk and Silk Goods exported from the United Kingdom during the years 1860 to 1884 inclusive

comparatively new trade in spun silk goes far to compensate for the loss of the older trade, and has enabled the exports of silk manufactures from the country to be at least maintained and to show some signs of expansion. The spun-silk industry has chiefly developed in the Yorkshire and Lancashire textile centres,—Bradford, Halifax, Rochdale, &c. But it is highly significant that, while the exports of British silk manufactures have not decreased, the imports in the meantime have shown a marked expansion; and unquestionably, although the use of silken goods has increased very greatly within twenty five years, the expansion of native silk manufactures has not kept pace with that growth.

Favoured by the operation of protective duties ranging from 50 to 60 per cent *ad valorem*, the native manufacture of silk in the United States has been nursed into considerable activity and expansion, till now well-nigh one half of the silken fabrics used in the country are of home manufacture. In 1860 the proportion of native manufacture was 13 per cent, in 1880 it reached 38 per cent, and in 1882 it was 40 per cent of the entire consumption. Reeled silks are principally manufactured at Paterson and Hoboken, N. J., and Brooklyn and New York City, N. Y., and the spun-silk industry flourishes at South Manchester and Hartford, Conn.

The following estimate of the relative importance of the silk manufacture of various countries was made in 1883 by Mr Peixotto, the United States consul at Lyons:—

France	$85,000,000	Russia	16,000,000
Germany	45,000,000	Austria	12,000,000
United States	35,000,000	Italy	12,000,000
Great Britain	25,000,000	Spain	5,000,000
Switzerland	18,000,000	Other countries	17,000,000

giving a total of $270,000,000. (J. PA.)

SILLIMAN, BENJAMIN (1779–1864), American chemist and geologist, was born in 1779 at Trumbull (then called North Stratford), Connecticut. His father, Gold Selleck Silliman, was brigadier-general in the war of the revolution, and had also held important civil positions. The history of the family points to an Italian origin, but Daniel Silliman, the first to settle in the United States, came from Holland. Silliman received his early education at Fairfield, Connecticut, at that time the residence of his father's family, and in 1792 he entered Yale College, where he graduated in 1796. He then studied law, and was admitted to the bar in 1802, while a tutor in Yale College, to which position he had been appointed in 1799. In 1802 a professorship of chemistry and natural history was established in the college, and he was at once elected to fill it. He spent portions of 1801 and 1802 in Philadelphia in preparation for his work, and the year 1804 he spent in Europe, chiefly in England and Scotland, where he attended the lectures of Hope and Gregory, and also formed the acquaintance of Davy, Wollaston, Brewster, Leslie, and other eminent men of science. As a result of this visit he published *A Journal of Travels in England, Holland, and Scotland, and of Two Passages over the Atlantic in the years 1805 and 1806* (2 vols., 1810), which had a marked success. In 1813 he began service with the medical department of Yale College as professor of chemistry and pharmacy, and continued to give instruction there for many years. In 1818 he founded the *American Journal of Science and Arts*, a periodical devoted to the physical sciences, which has been, and is, the most important American scientific serial. In 1851 he made a second journey to Europe, of which he likewise published an account in two volumes, edited by his son, who had accompanied him. In 1853 he became professor *emeritus*, but he continued to lecture for a year or two longer. His closing years were quietly spent in unabated mental activity at New Haven until his death in 1864. Though devoted to scientific pursuits, he interested himself in the public movements of the time.

One of Silliman's earliest scientific publications was an account of the famous meteorite which fell in Weston, Conn., December 14, 1807. This account, which excited great public interest in the country, was reproduced abroad, and was read before the Royal Society of London, and also before the French Academy. Among his other scientific labours may be mentioned his experiments upon the fusibility of various substances in the flame of the compound blowpipe of Hare, then a novelty in science, and upon the vaporization and transference of the carbon in the voltaic arc from the positive to the negative pole, which he was the first to observe. He also repeated the experiment by which Gay-Lussac had separated potassium from its hydrate, and obtained the element in its metallic form, doubtless for the first time in the United States. Other professional labours were an exploration of the coal formations of Pennsylvania in 1830, and an examination of the gold mines of Virginia in 1836. In 1832 and 1833, by appointment of the United States Government, he made a scientific investigation of the culture and manufacture of sugar, embodying his results in a voluminous report published by the Government. Though Silliman published a large number of scientific papers upon chemical and geological subjects, his reputation was more especially due to the courses of public lectures which he delivered in the college and in various cities and towns of the United States. The happy combination of a graceful and interesting style with unwonted splendour of experimental illustration gave these lectures an unprecedented popularity, and they exerted a powerful influence in awakening and developing a taste for scientific matters throughout the country.

Besides the works already mentioned, Silliman published in 1808 an American edition of Henry's *Chemistry*, with notes, in 1827 an edition of Bakewell's *Geology*, and in 1830 *Elements of Chemistry*, in two volumes. An account of his life, by Prof. George P. Fisher, of Yale College, was published in two volumes in 1866.

SILLIMAN, BENJAMIN (1816–1885), American chemist and physicist, son of the preceding, was born in 1816 at New Haven, Connecticut, and educated at Yale College, where he graduated in 1837. He then became assistant to his father in chemistry, mineralogy, and geology, working in his laboratory at the college, and pursuing original investigations. He began teaching in the laboratory soon afterwards. The school thus informally established was shortly afterwards recognized by a formal act of the corporation of the college, and ultimately developed into the Sheffield Scientific School of Yale College. In 1838 he became associate editor with his father of the *American Journal of Science and Arts*, and he continued in the editorship of the journal until the close of his life, Prof. J. D. Dana (his brother-in-law) having joined him in 1846. In the winter of 1845–46 he gave a course of lectures on agricultural chemistry in New Orleans, which is believed to have been the first course of lectures upon that subject ever given in the United States. In 1849 he was appointed professor of medical chemistry and toxicology in the medical department of Louisville university, Louisville, Kentucky, which position he held for five years. In 1854 he succeeded his father as professor of chemistry, and continued to give instruction in this science, first in the academical and afterwards in the medical department of Yale College, until his death in 1885. In 1853 he was connected with the exhibition at the Crystal Palace in New York, having charge of the departments of chemistry, geology, and mineralogy. As a result of this work he edited a large quarto volume, *The World of Science, Art, and Industry* (1853), followed in 1854 by *The Progress of Science and Mechanism*. He also published in 1846 *First Principles of Chemistry*, a text-book which had a wide sale and passed through three editions. In 1858 he published a manual of physics entitled *First Principles of Physics or Natural Philosophy* (2d ed. 1861). In 1864 and again in 1867 and 1872 Silliman visited California, being engaged in professional work connected with various mines and in mineralogical and geological explorations. Still later he made several visits to the mining regions of the western States and Territories, and the results of his observations formed the subjects of numerous scientific papers. In 1874, the centennial anniversary of Priestley's discovery of oxygen, he delivered at Northumberland, Pa., where Priestley had resided during the later years of his life, an historical address on "Ame-

ican Contributions to Chemistry," which he afterwards expanded into a considerable volume

SILO A modern silo is a pit or erection in which green crops are preserved in an undried condition for fodder The term is derived from the Greek σιρός (Lat *sirus*), a pit for holding grain It is only of recent years that *ensilage*, *i e*, the preservation of green food for cattle by partial fermentation in silos, has become an important feature in agricultural economy In various parts of Germany a method of preserving green fodder precisely similar to that used in the case of sauerkraut (see vol iv p 618) has prevailed for upwards of a century Special attention was first directed to the practice of ensilage by a French agriculturist, M Auguste Goffart of Sologne near Orleans, who in 1877 published a work (*Manuel de la Culture et de l'Ensilage des Mais et autres Fourrages Verts*) detailing the experiences of many years in preserving green crops in silos An English translation of M Goffart's book by Mr J B Brown was published in New York in 1879, and, as various experiments had been previously made in the United States in the way of preserving green crops in pits, M Goffart's experience attracted considerable attention The conditions of American dairy farming proved eminently suitable for the ensiling of green maize fodder, and the success of the method was soon indisputably demonstrated among the New England farmers The favourable results obtained in America led to much discussion and to the extensive introduction of the system in the United Kingdom, where, with different conditions, success has been more qualified, but still highly encouraging

It has been abundantly proved that ensilage forms a wholesome and nutritious food for cattle It can be substituted for root crops with advantage, because it is succulent and digestible, milk resulting from it is good in quality and taste, it can be secured largely irrespective of weather, it carries over grass from the period of great abundance and waste to times when none would otherwise be available, and a larger number of cattle can be supported on a given area by the use of ensilage than is possible by the use of green crops

A silo should have a depth of at least 15 feet, and may either be a pit or a building above ground, provided it is water-tight and, as far as possible, air-tight The crops suitable for ensilage are the ordinary grasses, clovers, lucerne, vetches, oats, rye, and maize, but various weeds may also be stored in silos with good results, notably spurrey (*Spergula arvensis*), a most troublesome plant in poor light soils As a rule the crop should be mown when in full flower, and deposited in the silo on the day of its cutting Fair dry weather is not essential, but it is found that when moisture, natural and extraneous, exceeds 75 per cent of the whole, good results are not obtained The material is spread in uniform layers over the floor of the silo, and closely packed and trodden down If possible, not more than a foot or thereby should be added daily, so as to allow the mass to settle down closely, and to heat uniformly throughout When the silo is quite filled a layer of straw or some other dry porous substance is spread over the surface, then it is covered with boards, and a pressure of not less than 100 ℔ per square foot is applied by weighting or other mechanical means

A silo thus contains, to begin with, a mass of living vegetable cells surrounded with a minimum of oxygen The activity of the cells continuing, oxygen is absorbed and carbonic acid evolved, and part of the starch of the plants is converted into sugar In the atmosphere of carbonic acid thus created the acid ferments manifest their vitality, and acetic, lactic, and butyric acids are developed at the expense of the starch and sugar These chemical changes are accompanied with an evolution of heat, and the temperature of the mass rises, till, when it attains 122° Fahr, the action of the ferments is arrested Should the heat rise to 150° the vitality of the vegetable cells themselves is destroyed, and also when the available oxygen is exhausted chemical change ceases and sweet silage is produced When from excess of moisture or other cause the temperature of the silo does not reach 122° Fahr, the acid ferments are not killed, and they go on evolving chiefly acetic and lactic acids, the results being sour silage These ferments, requiring nitrogen for their existence, act on the nitrogenous constituents of the plants, rendering the albuminoids partly soluble, evolving peptones, and by further splitting up producing amides, urea, and ammonia The production of sour silage is accompanied by much greater transformation and loss than is incident to sweet silage, and in extreme action the material acquires a most disagreeable odour There is, however, no sharp line of distinction between the two, and both varieties are eaten freely by stock Frequently a considerable loss occurs around the edges, and at other points where air gets access to the mass, by mildewing See *Report* of Select Committee

SILURIDÆ, a large family of freshwater Fishes, flourishing in the present epoch, and represented by a great variety of forms in all the tropical and temperate regions, many of them reaching back into the Tertiary age The principal characters of this family (termed a "suborder" by some), its position in the system, its geographical distribution, and some of the most remarkable points in the structure and life-history of its members have been already sufficiently noticed under ICHTHYOLOGY, but we have here to notice more fully the sections into which it has been divided, and certain remarkable forms which were referred to nominally only in that article

The modifications of the vertical fins, or rather the specialization of certain portions at the expense of others, and the greater or less extent of the branchial aperture form excellent characters for subdividing the Siluroids.

I In the *Siluridæ Homalopteræ* the vertical fins are exceedingly long, occupying nearly the whole extent of the embryonal fin, and in one genus (*Heterobranchus*) a great part of the dorsal portion retains its embryonic character, being a rayless adipose fin All the Siluroids of this section belong to the fauna of the Old World and Australia The rivers and lakes of tropical Africa harbour many species of the genera *Clarias* and *Heterobranchus*,—those of the Nile being known under the name of "Carmoot" One of the Nilotic species, *Clarias macracanthus*, occurs abundantly in the Lake of Galilee, and, being a long, scaleless, eel-like fish of black colour, with eight long barbels round its broad mouth, was certainly included among those which the Jews were forbidden to eat by the Mosaic law These fish grow to a length of from 4 to 6 feet, and are eaten by the natives of tropical Africa

II In the *Siluridæ Heteropteræ* the dorsal fin has almost or entirely disappeared, only its foremost portion and a small adipose remnant may be preserved, on the other hand the anal portion is retained in its whole extent The gill-membranes remain separate and overlap the isthmus This section likewise belongs to the fauna of the Old World, and includes, among many others, the species which has given the name to the whole family, *Silurus glanis*, the "Wels"

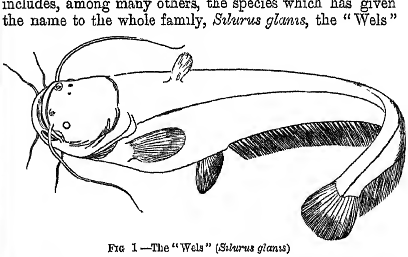

FIG 1—The "Wels" (*Silurus glanis*)

of the Germans It is the only representative of the family in Europe, and with the exception of the sturgeon, is the largest freshwater fish of the Continent It was known to Aristotle, who described it under the name of *Glanis* It inhabits more the central and eastern portions of Europe than the western, being absent in Italy, Greece, southern Switzerland, France, and those parts of Germany which are drained by the Rhine and its affluents. In general appearance it somewhat resembles the burbot. Its head is large

and broad, its mouth wide, furnished with six barbels, of which those of the upper jaw are very long. Both jaws and the palate are armed with broad bands of small closely-set teeth, which give the bones a rasp-like appearance. The eyes are exceedingly small. The short body terminates in a long, compressed, muscular tail, and the whole fish is covered with a smooth, scaleless, slippery skin. Specimens of 4 and 5 feet in length, and of 50 to 80 ℔ in weight, are of common occurrence. Its food consists chiefly of other bottom-feeding fishes, and in inland countries it is considered one of the better class of food fishes. Stories about children having been found in the stomach of very large individuals are probably inventions.

III. The *Siluridæ Anomalopteræ* are a small section from tropical America, in which the dorsal and adipose fins are very short and belong to the caudal vertebral column, while the anal is very long, and the gill-membranes are entirely separate, overlapping the isthmus.

IV. The *Siluridæ Proteropteræ* are a section extremely numerous in species, and represented throughout the tropics. The dorsal fin consists of a short-rayed and an adipose portion, the former belonging to the abdominal vertebral column; the anal is always much shorter than the tail. The gill-membranes are not confluent with the skin of the isthmus; they have a free posterior margin. When a nasal barbel is present, it belongs to the posterior nostril. This section includes among many others the genus *Bagrus*, of which the "Bayad" (*B. bayad*) and "Docmac" (*B. docmac*) frequently come under the notice of travellers on the Nile; they grow to a length of 5 feet, and are eaten. Of the "Cat-Fishes" of North America (*Amiurus*), locally called "bull-heads" or "horned-pouts," with eight barbels, some twenty species are known. Some of them are valued as food, especially one which is abundant in the ponds of New England, and capable of easy introduction into other localities (*A. nebulosus*). Others which inhabit the great lakes (*A. nigricans*) and the Mississippi (*A. ponderosus*) often exceed the weight of 100 ℔. *Platystoma* and *Pimelodus* people the rivers and lakes of tropical America, and many of them are conspicuous in this fauna by the ornamentation of their body, by long spatulate snouts, and by their great size. The genus *Arius* is composed of the greatest number of species (about seventy), and has the widest distribution of all Siluroids, being represented in almost all tropical countries which are drained by large rivers. Some of the species enter salt water. They possess six barbels, and their head is extensively osseous on its upper surface; their dorsal and pectoral spines are generally developed into powerful weapons. *Bagarius*, one of the largest Siluroids of the rivers of India and Java, exceeding a length of 6 feet, differs from *Arius* in having eight barbels, and the head covered with skin.

V. In the *Siluridæ Stenobranchiæ* the dorsal fin consists of an adipose portion and a short-rayed fin which belongs to the abdominal vertebral column, and, like the adipose fin, may be sometimes absent. The gill-membranes are confluent with the skin of the isthmus. The Siluroids belonging to this section are either South-American or African. Among the former we notice specially the genus *Doras*, which is distinguished by having a series of bony scutes along the middle of the side. The narrowness of their gill-openings appears to have developed in them a habit which has excited the attention of all naturalists who have visited the countries bordering upon the Atlantic rivers of tropical America, viz., the habit of travelling during seasons of drought from a piece of water about to dry up to ponds of greater capacity. These journeys are occasionally of such a length that the fish have to travel all night; they are so numerous that the Indians fill many baskets of them. Hancock supposes that the fish carry a small supply of water with them in their gill-cavity, which they can easily retain by closing their branchial apertures. The same naturalist adds that they make regular nests, in which they cover up their eggs with care and defend them,—male and female uniting in this parental duty until the eggs are hatched. *Synodontis* is

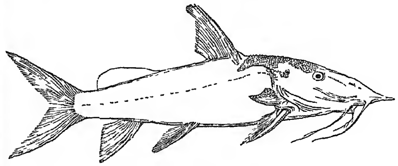

Fig. 2.—*Synodontis xiphias*.

an African genus and common in the Nile, where the various species are known by the name of "Shal." They frequently occur among the representations of animals left by the ancient Egyptians. The upper part of their head is protected by strong osseous scutes, and both the dorsal and pectoral fins are armed with powerful spines. Their mouth is small, surrounded by six barbels, which are more or less fringed with a membrane or with branched tentacles. Finally, the Electric Cat- or Sheath-Fishes (*Malapterurus*) also belong to this section. Externally

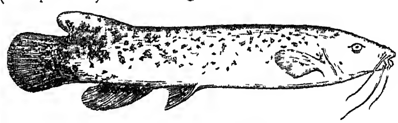

Fig. 3.—*Malapterurus electricus*.

they are at once recognized by the absence of a rayed dorsal fin, of which only a rudiment remains as a small interneural spine concealed below the skin. The entire fish is covered with soft skin, an osseous defensive armour having become unnecessary in consequence of the development of a powerful electric apparatus, the strength of which, however, is exceeded by that of the electric eel and the large species of *Torpedo*. It has been noticed in vol. xii. p. 650. Three species have been described from rivers of tropical Africa, of which one (*M. electricus*) occurs in the Nile; it rarely reaches a length of 4 feet.

VI. The section of *Siluridæ Proteropodes* contains small forms, some of which are of interest by the degree of specialization to which they have attained in one or the other direction. Many of them are completely mailed, but all have in common a short-rayed dorsal fin, with the ventrals below or rarely in front of it. Their gill-openings are reduced to a short slit; their pectorals and ventrals have assumed a horizontal position; and their vent is before, or not much behind, the middle of the length of the body. The first group of this section comprises alpine forms of the Andes, without any armature, and with a very broad and pendent lower lip. They have been referred to several genera (*Stygogenes*, *Arges*, *Brontes*, *Astroplebus*), but are collectively called "preñadillas" by the natives, who state that they live in subterranean craters within the bowels of the volcanoes of the Andes, and are ejected with streams of mud and water during eruptions. These fishes may, however, be found in surface waters at all times, and their appearance in great quantities in the low country during volcanic eruptions can be accounted for by numbers being killed by the sulphuretted gases which escape during an eruption and

by their being swept down with the torrents of water issuing from the volcano. The lowland forms have their body encased in large scutes, either rough, scale-like, and arranged in four or five series (*Chætostomus*), or polished, forming broad rings round the slender and depressed tail (*Loricaria*, fig. 4), or polished and large, so as to form two series only along the body and short tail (*Callichthys*, fig. 5). In India this section is but sparsely represented, chiefly in mountain-streams, by small loach-like Siluroids, in which various kinds of peculiar apparatus are developed to enable them to hold on to stones, this preventing their being swept away by the current; in *Pseudecheneis* the adhesive apparatus consists of transverse plaits of the skin on the thorax between the pectoral fins; in *Exostoma* the mouth is modified into a suctorial organ, probably with the same function. Finally, the South-American genus *Aspredo*, which is remarkable for the peculiar mode of protecting its eggs, as mentioned in vol. xii. p. 660, belongs also to this section.

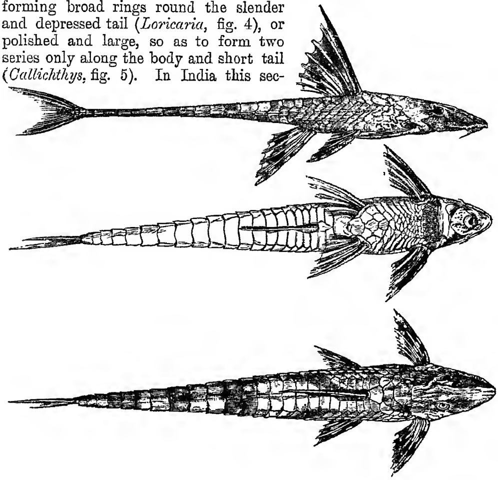

FIG. 4.—*Loricaria lanceolata*, from the upper Amazons. Natural size.

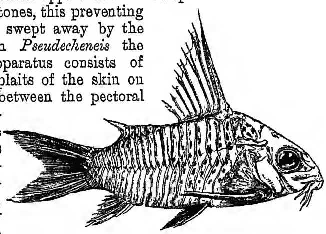

FIG. 5.—*Callichthys armatus*, from the upper Amazons. Natural size.

VII. The small section of *Siluridæ Opisthopteræ* comprises South-American forms, the majority of which inhabit waters at high altitudes up to 14,000 feet above the level of the sea. All have a short-rayed dorsal fin, placed above or behind the middle of the length of the body, above or behind the ventrals, which may be absent. Also the anal is short. The nostrils are remote from each other, and the gill-membranes are not confluent with the skin of the isthmus. These little fishes, of which *Trichomycterus* and *Nematogenys* are the principal genera, replace in the Andes the loaches of the northern hemisphere; they resemble them in appearance and habits, and even in coloration, offering a striking illustration of the fact that similar forms of animals are produced under similar external physical conditions.

VIII. Finally, the *Siluridæ Branchicolæ* comprise the smallest and least developed members of the family; they are referred to two genera only from South America, *Stegophilus* and *Vandellia*, the smallest of which does not exceed the length of 2 inches. Their body is soft, narrow, cylindrical, and elongate; the dorsal and anal fins short; the vent far behind the middle of the length of the body; gill-membranes confluent with the skin of the isthmus. Each maxillary is provided with a small barbel; and the gill-covers are armed with short stiff spines. Their small size notwithstanding, these Siluroids are well known to the Brazilians, who accuse them of entering and ascending the urethra of persons while bathing, causing inflammation and sometimes death. They certainly live parasitically in the gill-cavity of large Siluroids, probably entering those cavities for places of safety, but without drawing any nourishment from their hosts. (A. C. G.)

SILVANUS, an ancient Italian god of the woods (*silvæ*), closely allied to Faunus. Virgil speaks of him as a god of fields and cattle, and says that the Pelasgians dedicated a grove to him near Cære. Horace calls him the god of boundaries. Pigs were sacrificed to him, and at harvest festivals he received offerings of milk. He appears sometimes, especially in inscriptions, as a domestic god, and is occasionally associated with the Lares and Penates. Virgil describes him as crowned with fennel and lilies or carrying an uprooted cypress in his hand. On a relief he appears with a crown of pine branches in his hair, a pine branch in his left hand, a skin filled with fruits hanging about his neck, a pruning-knife in his right hand, and a dog by his side. On votive tablets he is oftener represented as the god of planting and gardening than as the rough woodland deity.

SILVER[1] is widely diffused throughout the earth's crust, including the ocean, which contains a trace of the noble metal—minute, it is true, in a relative sense, but in absolute amount approaching 10,000 million tons. Of the varieties of silver ores, the following chiefly are metallurgically important:—(1) *Reguline Silver*, generally alloyed with mercury or gold, and if with the latter including sometimes a trace of platinum; (2) *Horn Silver*, native chloride, $AgCl$; (3) *Silver Glance*, native sulphide, Ag_2S; (4) *Silver-Copper Glance*, $(Ag,Cu)_2S$; (5) *Pyrargyrite* ("Rothgültigerz"), Ag_3SbS_3; (6) *Stephanite*, Ag_5SbS_4; (7) *Polybasite*, $9(Ag_2,Cu_2)S+(Sb_2,As_2)S_3$. Silver is also frequently met with in base-metallic ores, *e.g.*, in lead ores and many kinds of pyrites. Unmixed silver minerals nowhere present themselves in large continuous masses. What we call "silver ores" are all more or less complex mixtures in which the non-argentiferous components are usually decidedly in the majority. Their metallurgic treatment depends chiefly on the nature of these admixtures, the state of combination of the silver being as a rule irrelevant in the choice of a process, because some at least of the noble metal is always present as sulphide, and our modes of treatment for it include all other native forms.

Amalgamation.—If a given ore is relatively free of base "metals" (metallurgically speaking), some process of "amalgamation" may be, and often is, resorted to.

In the *Freiberg process* the first step is to roast the (ground) ore with common salt, which converts the sulphide of silver into

[1] Compare CHEMISTRY, vol. v. p. 528–530; also MINING, MINT, and MONEY.

chloride ($Ag_2S + 2NaCl + 4O$ from the air $= 2AgCl + Na_2SO_4$) The mass, along with certain proportions of water, scrap-iron, and mercury, is placed in barrels, which are then made to rotate about their axes so that the several ingredients are forced into constantly varying contact with one another The salt solution takes up a small proportion of chloride, which in this (dissolved) form is quickly reduced by the iron to the metallic state ($2AgCl + Fe = FeCl_2 + 2Ag$), so that there is, so to say, room made in the brine for another instalment of chloride of silver, which is reduced in its turn, and so on to the end,—the metal formed uniting with the mercury into a semi-fluid amalgam Of this the bulk at least readily unites into larger continuous masses, which, on account of their high specific gravity, are easily separated from the dross mechanically The amalgam is pressed in linen bags to eliminate a quantity of relatively silver-free liquid mercury (this of course is utilized as such in subsequent operations), and the remaining solid amalgam is subjected to distillation from iron retorts, whereby its mercury is recovered as a distillate while a more or less impure silver remains in the retort This process, after having been long wrought in Freiberg with great success, is now superseded there by the Augustin method (see below), but it survives in some other places, as, for example, the Washoe or Comstock district in the Sierra Nevada (United States) It is not used in Chili, Peru, and Mexico because of the scarcity of fuel

The *Mexican process*, though far less perfect than that of Freiberg, evades this difficulty It was tried for the first time, if not actually invented, by Bartolomeo de Medina in 1557 It was adopted in Mexico in 1566 and in Peru in 1574, and is in use in both countries and in Chili to this day The stamped ore is ground into a fine paste with water, this paste, after having been allowed to dry up a little in air, is placed on a stone floor along with a quantity of salt, and the two are trodden together by mules On the following day there are added certain proportions of "magistral" (a kind of crude sulphate of copper made by roasting copper pyrites) and of mercury, and the mules are kept going until the silver is as far as possible converted into amalgam, which takes from fifteen to forty-five days The rationale of the process is not quite understood According to Boussingault, the cupric chloride (formed by the salt from the sulphate) chlorinates part of the sulphide of silver, thus—

$$2CuCl_2 + Ag_2S = 2AgCl + S + Cu_2Cl_2,$$

and the cuprous chloride formed acts upon another portion of sulphide of silver, thus—

$$Cu_2Cl_2 + Ag_2S = 2AgCl + Cu_2S,$$

and in this way all the sulphide of silver is gradually converted into chloride The chloride is reduced to the metallic state by the mercury ($AgCl + Hg = HgCl + Ag$) with formation of calomel, the metallic silver uniting with the surplus mercury into amalgam The calomel is allowed to go to waste

The *Augustin process* of silver extraction is only a peculiar mode of metallifying and collecting the silver of an ore after it has been by some preliminary operation converted into chloride or sulphate Either salt is brought into solution—the chloride by means of hot brine, the sulphate by means of hot water, acidified with oil of vitriol, the solution is separated from the insolubles, and made to filter through a bed of precipitated copper The copper reduces the silver to metal, which remains on the bed as a spongy mass, while an equivalent quantity of copper chloride (or sulphate) passes through as a solution The silver sponge is collected, freed from adhering copper by muriatic acid in contact with air, and then sent to the furnace From the copper liquor that metal is precipitated in its original form by means of iron

The silver furnished by any of these methods is never pure, even in the commercial sense A general method for its purification is to fuse it up with lead and subject the alloy to cupellation (see LEAD, vol xiv p 376) Cupel-silver is apt to contain small quantities of lead (chiefly), bismuth, antimony, copper, and more or less of gold, of which metals, however, only the first three are reckoned "contaminations" by the metallurgist They can be removed by a supplementary cupellation, without added lead, at a high temperature Addition of lead would remove the copper likewise, but it is usually allowed to remain and the alloy sent out as cupriferous silver, to be alloyed with more copper and thus converted into some kind of commercial "silver" (see below) If gold is present to the extent of 0 1 per cent or more, it is recovered by treatment of the metal with nitric acid or boiling vitriol The gold in either case remains as such, the silver becomes nitrate or sulphate, and from the solution of either salt is recovered by precipitation with metallic copper Although nitric acid is the more expensive of the two parting agents, it is often now preferred because photography has created a large demand for nitrate of silver Compare GOLD, vol x p 749

For the "incidental" extraction of silver from essentially base-metallic ores the method in the case of all lead ores is simply to proceed as if only lead were present, and from the argentiferous lead produced to extract the noble metal by one of the processes described under LEAD (vol xiv p 376–7), while for the treatment of sulphureous copper ores one method is so to smelt the ore (with, if necessary, an addition of galena or some form of oxide of lead) as to produce a regulus of lead and a "mat" of sulphide of copper, (Cu_2S), which latter should contain as little lead as possible The silver follows chiefly the lead, and is extracted from it by cupellation, but some silver remains in general even with a lead-free mat Compare account of the Lautenbach process under LEAD

A modern mode of extracting the silver from a copper mat is to roast it at a very low temperature, so as to produce a relatively large proportion of metallic sulphate, and then to destroy the bulk of the sulphate of copper by a judiciously-regulated higher temperature The silver all remains as sulphate, which is extracted by hot dilute sulphuric acid and wrought by the Augustin method

Very interesting is the process which was patented by Claudet for the remunerative extraction of the few hundredths of a per cent of silver contained in that kind of cupriferous iron pyrites which is now used, almost exclusively, for the making of vitriol The "cinders," as returned by the vitriol maker, are habitually worked up for copper by roasting them with salt and lixiviating the roasted mass with water, when the copper dissolves as chloride, Cu_2Cl_2 and $CuCl_2$ The silver goes with it, but for its precipitation no method was known until Field found that silver dissolved as AgCl in a chloride solution can be precipitated exhaustively by addition of the calculated proportion of a soluble iodide, as AgI Claudet's process is only an adaptation of Field's discovery After having diluted the copper liquor with a certain proportion of water he adds the weight of iodine, calculated from the assay, as solution of iodide of zinc, which produces a very impure precipitate of iodide of silver From it he re-extracts the iodine, by treatment with zinc and dilute sulphuric acid, as iodide of zinc, which is used over again The "silver precipitate," which now contains its silver as metal mixed with a large quantity of (chiefly) sulphate of lead, goes to the metal-refiner, who treats it as a lead ore

Chemically Pure Silver—Even the best "fine" silver of commerce contains a few thousandth-parts of copper or other base metal To produce perfectly pure metal the most popular method is to first prepare pure chloride (by applying the method given below under "Chloride" to a nitric solution of any kind of ordinary "silver"), and then to reduce the chloride to metal, which can be done in a great variety of ways One way is to mix the dry chloride intimately with one-fifth of its weight of pure quicklime or one-third of its weight of dry carbonate of soda, and to fuse down the mixture in a fire-clay crucible at a bright red heat In either case we obtain a regulus of silver lying under a fused slag of chloride—$2AgCl + (CaO$ or $Na_2CO_3) = 2Ag + (CaCl_2 + O$ or $2NaCl + CO_2 + O)$ The fused metal is best granulated by pouring it from a sufficient height, and as a thin stream, into a mass of cold water A convenient wet-way method for small quantities is to boil the recently precipitated chloride (which must have been produced and washed in the *cold*) with caustic soda-ley and just enough of sugar to take away the oxygen of the Ag_2O transitorily produced The silver in this case is obtained as a yellowish-grey heavy powder, which is easily washed by decantation, but it tends to retain unreduced chloride, which can be removed only by fusion with carbonate of soda

Stas recommends the following process as yielding a metal which comes nearer ideal purity Slightly cupriferous silver is made into dry nitrate and the latter fused to reduce any platinum nitrate that may be present to metal The fused mass is taken up in dilute ammonia and diluted to about fifty times the weight of the silver it contains The filtered (blue) solution is now mixed with an excess of solution of sulphite of ammonia, $SO_3(NH_4)_2$, and allowed to stand After twenty-four hours about one-half of the silver has separated out in crystals, from the mother-liquor the rest comes down promptly on application of a water-bath heat The rationale of the process is that the sulphite hardly acts upon the dissolved oxide of silver, but it reduces some of the oxide of copper, $2CuO$, to Cu_2O, with formation of sulphate $SO_4(NH_4)_2$ This Cu_2O deoxidizes its equivalent of Ag_2O, forming $Ag + Cu_2O_2$, which latter is reduced by the stock of sulphite and reconverted into Cu_2O which now acts upon a fresh equivalent of Ag_2O, and so on to the end

Pure silver (ingot) has a beautiful white colour and lustre; it is almost as plastic as pure gold, and, like it, very soft. It does not tarnish in natural air; but in air contaminated with ever so little sulphuretted hydrogen it gradually draws a black film of sulphide. The specific gravity of the frozen metal is 10·42 to 10·51, rising to 10·57 after compression under a die. It is the best conductor of heat and electricity. The expansion of unit length from 0° to 100° C. is 0·001936 (Fizeau). The specific heat is 0·0570 (Regnault), 0·0559 (Bunsen). It fuses at 954° C. (Violle)—*i.e.*, far below the fusing point of copper or gold—without oxidation, unless it be in contact with a surface of silicate (porcelain glaze, &c.), when a trace of silicate of Ag_2O is produced. It volatilizes appreciably at a full red heat; in the oxyhydrogen flame it boils, with formation of a blue vapour. The fused metal readily absorbs oxygen gas (under fused nitre as much as twenty times its volume—Gay-Lussac). When the oxygenated metal freezes the absorbed gas goes off suddenly at the temperature of solidification, and, by forcing its way through the solid crust produces volcanic eruptions of metal which are sometimes very beautiful. The presence of even very little base metal in the silver prevents this "spitting," the base metal combining with the oxygen faster than it can be reabsorbed. Pure silver retains a trace of the absorbed oxygen permanently, and Dumas in an experiment on one kilogramme of metal extracted from it 82 milligrammes of oxygen in an absolute vacuum at 400°–500° C. Water, and ordinary non-oxidizing aqueous acids generally, do not attack silver in the least, hydrochloric acid excepted,—which, in the presence of air, dissolves the metal very slowly as chloride. A solution of common salt acts similarly, the liberated sodium becoming NaOH. Aqueous hydriodic acid, even in the absence of air, dissolves silver perceptibly, with evolution of hydrogen (Deville). Aqueous nitric acid dissolves the metal readily as nitrate; hot vitriol converts it into a magma of crystalline sulphate, with evolution of sulphurous acid. Silver is absolutely proof against the action of caustic alkali leys, and almost so against that of fused caustic alkalies even in the presence of air. It ranks in this respect next to gold, and is much used to make vessels for chemical operations involving the use of fused caustic potash or soda. The ordinary "fine" metal is good enough for this purpose.

SILVER ALLOYS.—Pure silver is too soft to make durable coins or vessels combining lightness with stability of form. This defect can be cured by alloying it with a little copper. All ordinary "silver" articles consist of such alloys. The proportion of silver in these (their "fineness") is habitually stated in parts of real silver per 1000 parts of alloy. In Great Britain all silver coins are made of "standard silver," the fineness of which, by legal definition, is 925. The toleration is 4 units (of pure silver in 1000 of alloy), *i.e.*, a specimen passes as long as its fineness lies between 925 and 921 (compare MINT, vol. xvi. p. 483). As regards silver-plate the "Hall" in London refuses to stamp any poorer alloy. In Germany and in the United States all silver coins, in France and Austria the major silver coins, are of the fineness 900, with a toleration of 3 units. The minor coins of Austria are of the fineness 375 to 520; in France all silver coins under one franc contain 835 of silver, 93 of copper, and 72 of zinc in 1000 parts. The fineness prescribed by law or custom for "silver" articles is 950 or 800 (±5) in France, 750 in North Germany, 812·5 in South Germany, and 820 in Austria. All *these* alloys at least are liable to "liquation," which means that, although they are perfectly homogeneous in the crucible, they freeze into layers of not absolutely the same composition. According to Levol, passing from the skin to the core of an ingot of 900 per mille silver the difference may amount to 3 units. Of all the alloys tried by that chemist only that composed according to the formula Ag_3Cu_2, corresponding to 719 per mille of silver, remained perfectly homogeneous on freezing. He therefore recommends this alloy for coinage; unfortunately, however, any silver copper alloy which contains less than about 750 per mille of noble metal tarnishes very perceptibly in the air. British standard silver is quite free of this defect, but it is inconveniently soft, far softer than the "900" alloy.

The extent to which the properties of silver are modified by addition of copper depends on the fineness of the alloy produced. The addition of even three parts of copper to one of silver does not quite obliterate the whiteness of the noble metal. According to Karmarsch the relative abrasion suffered by silver coins of the degrees of fineness named is as follows:—

Fineness	312	750	900	993
Abrasion	1	2·3	3·9	9·5

The same observer established the following relation between fineness p and specific gravity in coins containing from 375 to 875 of silver per 1000:—sp. gr. $= 0·001647p + 8·833$.

The fusing points of all copper-silver alloys lies below that of pure copper; that of British standard silver is lower than even that of pure silver. For the alloys of silver with other metals than copper, see GOLD, PLATINUM, and NICKEL. The present writer has introduced an alloy of 91 of silver, 7 of gold, and 2 of nickel as a material far superior, on account of its higher rigidity, to fine silver for the making of alkali proof vessels.

"Oxidized" silver is ordinary cupriferous silver superficially modified by immersion into sulphide of sodium solution (which produces a dark film of sulphide), or otherwise.

Silvering.—For the production of a silver coating on a base-metallic object we have chiefly two methods. One of these is to dissolve silver in mercury and to apply this amalgam to the (carefully cleaned) surface of the object by means of a brush. The mercury then is driven away by heat, when a coherent film of silver remains, which adheres very firmly, is quite continuous, and needs not be thick to stand polishing and other surface treatment. This very old method is to this day the best for producing a strong coating, but it is dangerous to the health of the workmen, expensive, and troublesome, and has been almost superseded by the modern process of *electroplating* (see ELECTRO-METALLURGY, vol. viii. p. 116). Objects made of iron or steel must first be coated over with copper, and then treated as if they consisted of that metal.

For *Glass-Silvering*, see MIRROR, vol. xvi. p. 500.

Inscriptions on linen, consisting of black metallic silver and consequently proof against all ordinary processes of washing, can be produced by using suitably-contrived silver solutions as inks. A mere solution of nitrate of silver (1 to 8 of water)[1] will do, if the surface to which it is applied has been prepared by impregnation with a solution of 6 parts of soda crystals and 17 of gum arabic in 30 of water, and subsequent ironing. The ink must be applied with a quill or gold pen (compare vol. xiii. p. 81).

SILVER COMPOUNDS.—(1) *Nitrate of Silver* ($AgNO_3$) is made by dissolving fine silver in a moderate excess of nitric acid of 1·2 sp. gr., applying heat at the end. The solution on cooling deposits crystals—very readily if somewhat strongly acid. Even a slightly cupriferous solution deposits pure or almost pure crystals. Any admixture of copper in these can be removed by fusing the dry crystals, when the copper salt only is reduced to black oxide of copper insoluble in water and thus removable, or by boiling the solution with a little pure oxide of silver (Ag_2O), which precipitates the CuO and takes its place. Nitrate of silver forms colourless transparent sonorous plates, which, if free of organic matter, remain unchanged in the light,—which agent readily produces black metallic silver if organic matter be in contact with the salt or its solution. One hundred parts of water dissolve, of nitrate of silver—

at 0°	11°	19°·5	110° C.
121·9	127·7	227	1111 parts

The solution is neutral to litmus. The salt dissolves in 4 parts of cold alcohol. Nitrate of silver fuses at 198° C. into a thin colourless liquid, which stands even higher temperatures without decomposition. At a red heat it is reduced to metal. The fused salt, cast into the form of quill sized sticks, is used in surgery as a cauterizing agent ("lapis infernalis," or lunar caustic). The sticks gain in firmness if alloyed with a little nitrate of potash.

(2) *Sulphate of Silver* (Ag_2SO_4) forms white crystals soluble in 200 parts of cold or 68 of boiling water, but more soluble in dilute sulphuric acid. It stands a red heat without decomposition.

(3) *Oxide of Silver* (Ag_2O) appears as a dark-brown precipitate when a solution of the nitrate is mixed with excess of caustic potash or—preferably for preparative purposes—baryta water. It is slightly soluble in water, forming a very decidedly alkaline (to litmus) solution, behaving as if it contained the (unknown) AgOH. It seems to suffer reduction in the light. In hydrogen it loses its oxygen at 100° C. (Wöhler), in air from about 250° C. upwards. Solutions of numerous organic substances and other agents reduce oxide of silver, more or less readily, to metal. Ritter produced what he took to be a *peroxide* of silver by decomposing a solution of the nitrate galvanically, in the form of black metallically-lustrous crystals, which gathered at the positive pole. At 110° C. these decompose almost explosively, with evolution of the 12·77 per cent. of oxygen demanded by Ag_2O_2; yet according to Berthelot the crystals are $4Ag_2O_3 \cdot AgNO_3 + 2H_2O$. But a hydrate of Ag_4O_3 is got by the action of peroxide of hydrogen on Ag_2O.

[1] Preferably blackened for visibility by incorporation of some Chinese ink (carbon).

(4) *Chloride of Silver* (AgCl) comes down as a precipitate when solutions of silver salts are mixed with solutions of chlorides (for preparative purposes $AgNO_3$ with HCl, which is preferable to NaCl) The mixture at first has the appearance of a milk, but on being violently shaken it divides into a curdy, heavy, easily settling precipitate and a clear solution,—more readily if the co-reagents are exactly balanced or the silver is in excess than when the precipitant predominates Chloride of silver is as good as insoluble in water, but hydrochloric acid, and chloride solutions generally, dissolve it perceptibly In dilute sulphuric and nitric acids it is as insoluble as in plain water Even boiling oil of vitriol attacks it only very slowly It is readily soluble in ammonia solution and reprecipitated therefrom on acidification It dissolves in aqueous thiosulphate of soda, $Na_2S_2O_3$, forming the very stable salt $NaAg\ S_2O_3$, and in cyanide of potassium solution, forming $KAg\ (NC)_2$ From either solution the silver is conveniently recoverable only by sulphuretted hydrogen or sulphide of ammonium as an Ag_2S precipitate Chloride of silver fuses at 260° C into a yellowish liquid, freezing into a transparent, almost colourless, glass of horn-like consistence (hence the name "horn-silver") The specific gravity of frozen AgCl is 5 45 (Karsten) It remains undecomposed, but volatilizes appreciably at a red heat Hydrogen at a dull red heat reduces it to metal A similar reduction is effected in even the compact chloride by contact with zinc, water, and a little dilute sulphuric acid, the reduction, however, proceeds rather slowly and is rarely quite complete *Unfused* chloride of silver, when exposed to sunlight, becomes at first violet, then darker and darker, and at last black, through progressive dechlorination Yet even the black final product, according to Bibra, yields up no silver to hot nitric acid

(5) *Bromide of Silver* (AgBr) closely resembles the chloride The reduction on insolation is prevented by the presence of a trace of free bromine and promoted by that of nitrate of silver Chlorine converts the hot fused salt into chloride

(6) *Iodide of Silver* (AgI), while similar on the whole to the other two haloids, presents marked peculiarities As formed by precipitation it is distinctly yellow, it is insoluble in, but decolorized by, ammonia, it is less soluble in water and dilute nitric acid or other nitrate solutions than even the bromide, this latter exceeding in this sense the chloride But boiling oil of vitriol decomposes it slowly, with elimination of iodine vapours and formation of sulphate Hydrogen at a red heat does not act upon it, nor is it at all easily decomposed by zinc and dilute acid Precipitated iodide of silver is characteristically soluble in solutions of alkaline iodides and in those of nitrate of silver, with formation of double salts, which, however, are all decomposed, more or less completely, by addition of much water *Pure* iodide of silver, even if recently precipitated, is not changed by sunlight, but if contaminated with nitrate of silver it readily blackens For action of light on silver haloids, see PHOTOGRAPHY

ANALYSIS —In a solution of salts derived from purely oxygenated acids the least trace of silver can be detected by hydrochloric acid, which precipitates the silver as chloride (see above) The precipitate, when produced in a possibly complex solution, may include the chlorides of lead (PbCl) and mercurosum (Hg_2Cl_2) Repeated treatment of the (washed) precipitate with boiling water extracts the lead chloride, then by pouring ammonia on the precipitate we convert the Hg_2Cl_2 into an insoluble black body, while the chloride of silver dissolves and, from the filtrate, can be precipitated by acidification For the *quantitative* determination of silver, the ordinary laboratory method is to bring the metal into solution as nitrate and then to throw it down as pure chloride The chloride is washed, collected, dehydrated by fusion, and weighed According to Stas, if O=16, Ag=107 93 and Cl=35 454, hence the chloride contains 0 75273 of its weight of metal

The *assaying* of silver ores is done preferably in the "dry way", in fact relatively poor ores cannot be assayed satisfactorily in any other The general method with sulphureous ores is to mix them, as powders, with (silver-free) oxide of lead and tartar, and fuse in a clay or graphite crucible The regulus includes all the silver The fuse is poured into a conical mould of cast-iron, when the metal goes to the bottom of the mould, the ingot, after cooling, is easily separated from the adhering slag The slag-free regulus is then placed in a little cupel made out of compressed bone ash, and is heated in a muffle to redness and kept at this temperature in the current of air which pervades the muffle in virtue of its disposition in the furnace until all the lead and base metals generally have been sucked up by the porous cupel The remaining "button" of metal is weighed, which gives the conjoint weight of the silver and gold, which latter metal is rarely absent For its determination the button is rolled out into a piece of thin sheet, which is "parted" with nitric acid (see GOLD) The gold remains and goes to the balance, the weight of the silver is found by difference Similarly, to determine the fineness of silver alloys, a known weight of the alloy—customarily 0·5 gramme—is "cupelled," with addition of a proportion of pure lead depending on the weight of base metal to be removed, as shown by the following table, which, however, holds strictly only for copper-silver alloys —

Fineness 1000–900	80 units of lead per unit of copper
,, 900–850	64 ,,
,, 800–750	53 ,,
,, below 750	50–40 ,,

In a well appointed laboratory two operators who work into each other's hands can easily make several dozen of such assays in a day Cupelling, indeed, is the promptest of all methods of analysis, only the results are not quite as exact as is desirable in the case of precious metal, part of the silver being lost by volatilization, and part by being sucked into the cupel The error attains its maximum in the case of alloys of about 700 per mille, and with these comes to about $\frac{1}{130}$th of the weight of the silver to be determined It of course can be, and always is being, corrected to some extent by "blank" assays made with known weights of pure silver and pure copper, but such corrections are not quite safe Hence cupellation nowadays, in the mints at least, is used only for a first approximation, and the exact fineness determined by the "wet way" process, invented by Gay-Lussac See ASSAYING, vol ii p 727

A most excellent method for the quick determination of a not approximately known weight of dissolved silver has been invented by Volhard This method rests on the fact that solutions of sulphocyanates (including that intensely red salt $Fe(NCS)_3$ which is produced when, for instance, NCS H is mixed with ferric sulphate) precipitate silver completely from even strongly acid solutions, as NCS Ag A convenient reagent for the method is produced by dissolving $\frac{1}{10}$ NCS NH_4 grammes of (chlorine-free) sulphocyanate of ammonium in water to 1000 c c to produce a solution of which 1 c c precipitates about $\frac{1}{10}$ Ag=10 8 milligrammes of silver To determine the exact "titre," we dissolve, say, 540 milligrammes of pure silver in 1 2 nitric acid, and next boil away every trace of N_2O_3 We then dilute to say 50 c c, add 5 c c of saturated solution of iron alum (not less), and, lastly, run in sulphocyanate from the burette, until the red colour of ferric sulphocyanate which appears locally from the first, by addition of the last drop of NCS solution, has become permanent on stirring Supposing 49 3 c c of solution to have been required to reach this point, every 1 c c of reagent precipitates $\frac{540}{49 3}$ milligrammes of silver, and it, of course, always does so, even, let us add, in the presence of (say) 70 per cent of copper beside 30 of silver in the alloy under operation Volhard's method is more exact, and, with a small number of samples, takes even less time, than cupellation (W D)

Mode of Occurrence—Silver is rarely found in the native state, and then only in comparatively small quantities Most of the ores of silver are difficult to reduce, and it is therefore deemed safe to regard this as the last of the three great coining metals which came into use Silver is originally as widespread as gold, occurring in nearly all the volcanic rocks and some of the Primary ones In the Silver Reef district of Utah it is found in sedimentary sandstone, though this appears to have undergone some change from volcanic action But gold remains unaltered by the action of the elements, and is often carried away long distances from its original place of occurrence by the breaking down of the rocks which contain it and their formation anew elsewhere, either as other rocks or as "placers" of gravel or sand, containing gold easily washed out by hand or with rude appliances Silver, on the contrary, is only to be found in the rocks where it originally occurs When these are broken down or worn away, the silver is either driven into new mineral combinations, or, more commonly, dissipated and lost Hence silver is only to be obtained by subterranean mining, and demands the aid of capital and associated labour The greater rapidity with which gold can be obtained has often influenced the legal relation of value between these two metals, and its bearing upon prices, commerce, and civilization

Cost of Production.—In nearly all silver ores there is some gold, and in nearly all gold ores some silver In the £70,000,000 worth of metal produced from the Comstock lode of Nevada nearly one half in value consisted of gold For this and other reasons, it is impossible to determine the general average cost of producing gold and silver from all the mines during any reasonably long period of time If recent statistics are to be trusted, both metals are pro-

duced on the average at a loss Such is alleged to have been the case in California, Australia, and Nevada,[1] countries whose combined product has equalled in value nearly £600,000,000

Value —In some ancient states the value of silver appears to have been superior to that of gold [2] Agatharchides informs us that such was the case in ancient Arabia, and Tacitus says the same of ancient Germany Strabo alleges that the ratio of value in a country bordering that of the Sabæans was at one time one gold to two silver, and so late as the 17th century silver and gold were valued equally in Japan [3] Going back to a remote antiquity, silver appears to have been everywhere equal in value to gold until the silver mines showed signs of exhaustion, when, as the principal coins were of copper and silver, and prices were commonly expressed in these coins, the threatened decrease of money was probably averted and a profit secured for the state by raising the legal value of gold coins In Greece, in the time of Herodotus (*cf* iii 95), gold was 13 times the value of silver, at which ratio it appears to have stood for a long period

When the Romans acquired the placer mines of Pannonia, Dacia, Spain, Gaul, &c, they made their principal coins of gold, and at a later period, when the supplies of this metal fell off, they raised the legal value of silver coins to one-tenth that of gold ones of like weight and fineness This ratio was afterwards changed to 11, and still later to 12 silver for 1 gold In the Arabian states of the 7th century the ratio was about 6½ for 1, yet in France at the same time it was 10 for 1, in England during the 12th century it was 9 for 1, in France during the 14th century certain silver and gold coins of like weight bore the same value, hence the ratio was 1 for 1, in Castile and Leon in 1454–74 it was 7½ for 1 Speaking broadly, between the rise of Mohammedanism and the opening of the silver mines of America the value of silver compared with gold gradually rose It is evident that there were two lines of ratios, the one having an Indo-Arabic, the other a Romano-Germanic origin, and that the conflict of ratios—which only ceased when America was discovered and a great coinage of the precious metals occurred in Spain—gave rise to many of those otherwise inexplicable lowerings of coins, of one or the other metal, which characterize this period

In Spain, by the edict of Medina (1497), the ratio was 10¾ When America was plundered the first fruits were gold, not silver, whereupon Spain, in 1546, and before the wealth of the silver mines of Potosi was known, raised the legal value of gold to 13⅓, and, as Spain then monopolized the supplies of the precious metals, the rest of the world was obliged to acquiesce in her valuation During the following century Portugal obtained such immense quantities of gold from the East Indies, Japan, and Brazil that the value of her imports of this metal exceeded £3,000,000 a year, whilst those of Spain had dwindled to £500,000 in gold, and had only increased to £2,500,000 in silver Portugal now governed the ratio, and in 1688 raised the value of gold to 16 times that of silver Except during a brief period of forty years, this ratio has ever since been maintained in Spanish and British America and the United States A century later the spoils of the Orient were exhausted, the Brazilian placers began to decline, and Portugal lost her importance Spain thus again got control of the ratio, and, as her colonial produce was chiefly silver, she raised its value in 1775 from one-sixteenth to one-fifteenth and a half that of gold for the Peninsula, permitting it to remain at one-sixteenth in the colonies France, whose previous ratio (that of 1726) was 14½, adopted the Spanish ratio of 15½ in 1785, and has adhered to it ever since These three historical ratios, and the bearing of each upon the others, have influenced all legislation on the subject, and, where there was no legislation, have governed the bullion markets for more than two centuries

Meanwhile an economical school arose which, while conceding it to be necessary that the state should fabricate coins, denied it the right to limit the number of coins or to exact payment (seigniorage) for coinage This school found expression in the Act 18 Charles II (1666), which permitted private persons to have coined for them an unlimited quantity of gold or silver, at the public mint, free of charge Similar Acts were passed in Holland, France, and other countries But the crown retained the right to regulate the nominal value of gold and silver coins, the exercise of which has had the greatest influence on the relative market value of those metals

To check abuses of this prerogative the economical school next directed its efforts towards the adoption of one in place of two metals for full legal tender coins The principal advocates of this change during the last century were Dutot (1739) and Desrotours (1790), and during the present one Lord Liverpool (1808), De Quincey (1849), and Chevalier (1856) The policy thus advocated was practically adopted in Holland and England during the 18th century, and by the latter definitively in 1816 It was accepted by the Monetary Conference assembled at Paris June 20, 1867, and by the Commercial Convention at Berlin October 20, 1868 In 1871 it was practically, though not definitively, adopted by Germany, and since that date by several smaller states, including distant Japan In France (1874) and the United States (1873–78) the policy pursued has been a waiting one Full legal tender silver coins continue to be employed for money, but the state has ceased to coin silver on private account Either Germany, France, or the United States may, by simple enactment, and without recoinage or change of coins, return to the "bimetallic" basis of money

The closure of the mints of all important commercial countries to silver, while they have remained open to the free coinage of gold at a fixed valuation, has enhanced the purchasing power of gold, compared with either silver or other commodities, about one-fourth The price of uncoined silver being usually quoted in gold, this phenomenon appears as a "fall of silver," by which term it is commonly known This alleged fall, its causes, consequences, and remedies, constitute the "Silver Question"

Production —In the principal producing countries—the United States, Mexico, Chili, and Peru—mining is free, and there are no official returns of the production, which is therefore mere matter of conjecture In the United States it is the custom to value silver bullion at one-sixteenth that of gold This unduly swells the value of the conjectural product of that country more than one-fourth (see *Report* of the United States Monetary Commission of 1876, Appendix, pp 1–66) From a careful consideration of the bullion movement, the total annual product of silver throughout the world at the present time is estimated at between 50 and 60 million ounces, at which figure it has remained steady upwards of ten years

Consumption in the Arts —Direct inquiries as to the quantity of silver used in the arts have met with little success, and the statistics so obtained are defective But the total production of silver in the Western World, from the discovery of America to the present time, has been, in value, about 1400 million pounds sterling, of which about 300 million pounds remain in coins Conse-

[3] Sir Edward J Reed, *Japan*, chap xviii, DelMar, *Money and Civilization*, chap xx.

quently 1100 millions, or nearly four-fifths, have been consumed in the arts, lost, &c, or exported to Asia There are estimated to be about 50 or 60 million pounds sterling worth of silver coins in India,[1] and some trifling amounts each in China, Japan, Persia, &c On the whole it appears quite safe to estimate the average annual consumption of silver in the arts and through wear, tear, and loss as fully equal to three-fourths of the production Lowe in 1822 estimated it at two-thirds Silver is principally used for plate and jewellery, it is also consumed in photography, and in numerous chemical preparations, such as lunar caustic, indelible ink, hair dyes, fulminating powder, &c (A DE)

SILVERIUS, the successor of Pope Agapetus I, was a legitimate son of Pope Hormisdas, born before his father entered the priesthood He was consecrated on June 8, 536, having purchased his elevation to the see of St Peter from the Gothic king Theodotus Six months afterwards (Dec 9) he was one of those who admitted Belisarius into the city He opposed the restoration of the patriarch Anthimus, whom Agapetus had deposed, and thus brought upon himself the hatred of Theodora, who desired to see Vigilius made pope He was deposed accordingly by Belisarius in March 537 on a charge (not improbably well founded) of treasonable correspondence with the Goths, and degraded to the rank of a simple monk He found his way to Constantinople, and Justinian, who entertained his complaint, sent him back to Rome, but Vigilius was ultimately able to banish his rival to Pandataria, where the rest of his life was spent in obscurity The date of his death is unknown

SILVESTER I, bishop of Rome from January 314 to December 335, succeeded Melchiades and was followed by Marcus. The accounts of his papacy preserved in the *Liber Pontificalis* (7th or 8th century) and in Anastasius are little else than a record of the gifts said to have been conferred on the Roman Church by Constantine the Great He was represented at the council of Nice, and is said to have held a council at Rome to condemn the heresies of Arius and others The story of his having baptized Constantine is pure fiction, as almost contemporary evidence shows the emperor to have received this rite near Nicomedia at the hands of Eusebius, bishop of that city According to Dollinger, the entire legend, with all its details of the leprosy and the proposed bath of blood, cannot have been composed later than the close of the 5th century, while it is certainly alluded to by Gregory of Tours (*ob* 594) and Bede The so called *Donation of Constantine* was long ago shown to be spurious, but the document is of very considerable antiquity and, in Dollinger's opinion, was forged in Rome between 752 and 777 It was certainly known to Pope Hadrian in 778, and was inserted in the false decretals towards the middle of the next century

SILVESTER II, pope from 999 till 1003, and previously famous, under his Christian name of Gerbert, first as a teacher and afterwards as archbishop successively of Rheims and Ravenna, was an Aquitanian by birth, and was educated from his boyhood at the abbey of St Gerold in Aurillac Here he seems to have had Gerald for his abbot and Raymond for his instructor, both of whom were among the most trusted correspondents of his later life From Aurillac, while yet a young man (*adolescens*), he was carried off to the Spanish march by "Borrell, duke of Hither Spain" for the sake of prosecuting his studies in a district where learning, at that time, flourished more luxuriantly than in Aquitania. Borrell entrusted his young protegé to the care of a certain Bishop Hatto, under whose instruction Gerbert made great progress in mathematics. In this duke we may certainly recognize Borel, who, according to the Spanish chroniclers, was count of Barcelona from 967 to 993, while the bishop may probably be identified with Hatto, bishop of Vich or Ausona from *c* 960 to 971 or 972 In company with his two patrons Gerbert visited Rome, where the pope, hearing of the young student's proficiency in music and astronomy, induced him to remain in Italy, and before long introduced him to the emperor Otto I A papal diploma, still extant, shows that Count Borel and Bishop Octo or Otho of Ausona were at Rome in January 971, and, as all the other indications point to a corresponding year, enables us to fix the chronology of Gerbert's later life

When brought before the emperor, Gerbert admitted his skill in all branches of the quadrivium, but lamented his comparative ignorance of logic Eager to supply this deficiency he seized the opportunity of following Lothaire's ambassador Garamnus, archdeacon of Rheims, to this city, for the sake of studying under so famous a dialectician in the episcopal schools which were then (*c* 972?) rising into reputation under the care of Archbishop Adalbero (969–989) So promising a scholar soon attracted the attention of Adalbero himself, and Gerbert was speedily invited to exchange his position of learner for that of teacher At Rheims he seems to have studied and lectured for many years, having amongst his pupils, now or at a later time, Hugh Capet's son Robert, afterwards king of France, and Richer, to whose history we owe almost every detail of his master's early life According to this writer Gerbert's fame began to spread over western Europe, throughout Gaul, Germany, and Italy, till it roused the envy of a rival teacher, Otric of Saxony, in whom we may doubtless recognize Octricus of Magdeburg, the favourite scholar of Otto I, and, in earlier days, the instructor of St Adalbert, the apostle of the Bohemians Otric, suspecting that Gerbert erred in his classification of the sciences, sent one of his own pupils to Rheims to take notes of his lectures, and, finding his suspicions correct, accused him of his error before Otto II The emperor, to whom Gerbert was well known, appointed a time for the two philosophers to argue before him, and Richer has left a long account of this dialectical tournament at Ravenna, which lasted out a whole day and was only terminated towards evening at the imperial bidding The date of this controversy seems to have been about Christmas 980, and it was probably followed almost immediately by Otric's death, October 1, 981

It must have been about this time (*c* 982) that Gerbert received the great abbey of Bobbio from the emperor That it was Otto II, and not, as formerly supposed, Otto I, who gave him this benefice, seems evident from a diploma quoted by Mabillon (*Annales*, iv 121) Richer, however, makes no mention of this event; and it is only from allusions in Gerbert's letters that we learn how the new abbot's attempts to enforce his dues waked a spirit of discontent which at last drove him in November 983 to take refuge with his old patron Adalbero. It was to no purpose that he appealed to the emperor and empress for restitution or redress, and it was perhaps the hope of extorting his reappointment to Bobbio, as a reward for his services to the imperial cause, that changed the studious scholar of Rheims into the wily secretary of Adalbero It was a time of great moment in the history of Western Europe Otto II died in December 983, leaving the empire to his infant heir Otto III Lothaire claimed the guardianship, and attempted to make use of his position to serve his own purposes in Lorraine, which would in all probability have been lost to the empire had it not been for the indefatigable efforts of Adalbero and Gerbert. Into the obscure details of the succeeding years,

[1] R. B. Chapman, *Financial Department of Government of India*

as they have to be pieced together from the letters of Gerbert and the hints of Richer or the later annalists, there is no need to enter here Gerbert's policy is to be identified with that of his metropolitan, and was strongly influenced by gratitude for the benefits that he had received from both the elder Ottos

According to M Olleris's arrangement of the letters, Gerbert was at Mantua and Rome in 985 Then followed the death of Lothaire (2d March 986) and of Louis V, the last Carolingian king, in May 987 Later on in the same year Adalbero crowned Hugh Capet (1st June) and his son Robert (25th December) Such was the power of Adalbero and Gerbert in those days that it was said their influence alone sufficed to make and unmake kings The archbishop died 23d January 989, having, according to his secretary's account, designated Gerbert his successor before his decease Notwithstanding this, the influence of the empress Theophania secured the appointment for Arnulf, a bastard son of Lothaire The new prelate took the oath of fealty to Hugh Capet and persuaded Gerbert to remain with him When Charles of Lorraine, Arnulf's uncle, and the illegitimate son of Louis D'Outremer, surprised Rheims in the autumn of the same year, Gerbert fell into his hands and for a time continued to serve Arnulf, who had now gone over to his uncle's side He had, however, returned to his allegiance to the house of Capet before the fall of Laon placed both Arnulf and Charles at the mercy of the French king (*c* 30th March 991) Then followed the council of St Basle, near Rheims, at which Arnulf confessed his treason and was degraded from his office (17th June 991) In return for his services Gerbert was elected to succeed the deposed bishop

The episcopate of the new metropolitan was marked by a vigour and activity that were felt not merely in his own diocese but as far as Tours, Orleans, and Paris Meanwhile the friends of Arnulf appealed to Rome, and a papal legate was sent to investigate the question As yet Hugh Capet maintained the cause of his nominee and forbade the prelates of his kingdom to be present at the council of Mouzon, near Sedan (June 2, 995) Notwithstanding this prohibition Gerbert appeared in his own behalf The events of the next few years are somewhat obscure Council seems to have followed council, but with uncertain results At last Hugh Capet died in 996, and, shortly after, his son Robert married Bertha, the widow of Odo, count of Blois The pope condemned this marriage as adulterous, and Abbo of Fleury, who visited Rome shortly after Gregory V's accession, is said to have procured the restoration of Arnulf at the new pontiff's demand We may surmise that Gerbert left France towards the end of 995, as he was present at Otto III's coronation, May 21, 996 Somewhat later he became Otto's instructor in arithmetic, and had been appointed archbishop of Ravenna before May 998 Early in the next year he was elected pope (April 999), and took the title of Silvester II In this capacity Gerbert showed the same energy that had characterized his former life He is generally credited with having fostered the splendid vision of a restored empire that now began to fill the imagination of the young emperor, who is said to have confirmed the papal claims to eight counties in the Ancona march Writing in the name of the desolate church at Jerusalem he called upon the warriors of Christendom to arm themselves in defence of the Holy City, once "the light of the world," but now fallen so low Thus he sounds the first trumpet-call of the crusades, though almost a century was to pass away before his note was repeated by Peter the Hermit and Urban II [1]

[1] This letter, even if spurious as now suspected, is found in the 11th-century Leyden MS, and is therefore anterior to the first crusade

Nor did Silvester II confine himself to plans on a large scale He is also found confirming his old rival Arnulf in the see of Rheims, summoning Adalbero or Azelinus of Laon to Rome to answer for his crimes, judging between the archbishop of Mainz and the bishop of Hildesheim, besieging the revolted town of Cesena, flinging the count of Angoulême into prison for an offence against a bishop, confirming the privileges of Fulda abbey, granting charters to bishoprics far away on the Spanish mark, and, on the eastern borders of the empire, erecting Prague as the seat of an archbishopric for the Slavs More remarkable than all his other acts is his letter to St Stephen, king of Hungary, to whom he sent a golden crown, and whose kingdom he accepted as a fief of the Holy See It must, however, be remarked that the genuineness of this letter, in which Gerbert to some extent foreshadows the temporal claims of Hildebrand and Innocent III, has been hotly contested, and that the original document has long been lost All Gerbert's dreams for the advancement of church and empire were cut short by the death of Otto III, 4th February 1002, and this event was followed a year later by the death of the pope himself, which took place 12th May 1003 His body was buried in the church of St John Lateran, where his tomb and inscription are yet to be seen

A few words must be devoted to Silvester II as regards his attitude to the Church of Rome and the learning of his age He has left us two detailed accounts of the proceedings of the council of St Basle, and, despite his reticence, it is impossible to doubt that he was the moving spirit in Arnulf's deposition On the whole it may be said that his position in this question as to the rights of the papal see over foreign metropolitans resembled that of his great predecessor Hincmar, to whose authority he constantly appeals But it is useless to seek in his writings for any definition of the relationship of these powers laid down with logical precision He is rather the practised debater who will admit his opponent's principles for the moment when he sees his way to moulding them to his own purposes, than the philosophical statesman who has formulated a theory from whose terms he will not move Roughly sketched, his argument is as follows Rome is indeed to be honoured as the mother of the churches, nor would Gerbert oppose her judgments except in two cases—(1) where she enjoins something that is contrary to the decrees of a universal council, such as that of Nice, or (2) where, after having been once appealed to in a matter of ecclesiastical discipline and having refused to give a plain and speedy decision, she should, at a later date, attempt to call in question the provisions of the metropolitan synod called to remedy the effects of her negligence The decisions of a Gregory or a Leo the Great, of a Gelasius or an Innocent, prelates of holy life and unequalled wisdom, are accepted by the universal church, for, coming from such men, they cannot but be good But who could recognize in the cruel and lustful popes of later days,—in John XII or Boniface VII, "monsters, as they were, of more than human iniquity,"—anything else than "Antichrist sitting in the temple of God and showing himself as God?" Gerbert proceeds to argue that the church councils admitted the right of metropolitan synods to depose unworthy bishops, but contends that, even if an appeal to Rome were necessary, that appeal had been made a year before without effect This last clause prepares us to find him shifting his position still further at the council of Causey, where he advances the proposition that John XVI was represented at St Basle by his legate Seguin, archbishop of Sens, and that, owing to this, the decrees of the latter council had received the papal sanction Far firmer is the tone of his later letter to the same archbishop, where he contends from historical evidence that the papal judgment is not infallible, and encourages his brother prelate not to fear excommunication in a righteous cause, for it is not in the power even of the successor of Peter "to separate an innocent priest from the love of Christ"

Besides being the most distinguished statesman Gerbert was also the most accomplished scholar of his age But in this aspect he is rather to be regarded as the diligent expositor of other men's views than as an original thinker Except as regards philosophical and religious speculation, his writings show a range of interest and knowledge quite unparalleled in that generation His pupil Richer has left us a detailed account of his system of teaching at Rheims So far as the trivium is concerned, his text-books were Victorinus's translation of Porphyry's *Isagoge*, Aristotle's *Categories*, and Cicero's *Topics* with Manlius's *Commentaries* From dialectics he urged his pupils to the study of rhetoric, but, recognizing the necessity of a large vocabulary, he accustomed them to read the Latin poets with care Virgil, Statius, Terence, Juvenal, Horace,

Persius, and Lucan are specially named as entering into a course of training which was rendered more stimulating by a free use of open discussion. More remarkable still were his methods of teaching the quadrivium. To assist his lectures on astronomy he constructed elaborate globes of the terrestrial and celestial spheres, on which the course of the planets was marked; for facilitating arithmetical and perhaps geometrical processes he constructed an abacus with twenty-seven divisions and a thousand counters of horn. A younger contemporary speaks of his having made a wonderful clock or sun dial at Magdeburg, and we know from his letters that Gerbert was accustomed to exchange his globes for MSS of those classical authors that his own library did not contain. More extraordinary still was his knowledge of music—an accomplishment which seems to have been his earliest recommendation to Otto I. Probably he was beyond his age in this science, for we read of Garamnus, his first tutor at Rheims, whom he attempted to ground in this subject: "Artis difficultate victus, a musica rejectus est." Gerbert's letters contain more than one allusion to organs which he seems to have constructed, and William of Malmesbury has preserved an account of a wonderful musical instrument still to be seen in his days at Rheims, which, so far as the English chronicler's words can be made out, seems to refer to an organ worked by steam. The same historian tells us that Gerbert borrowed from the Arabs (Saraceni) the abacus with ciphers (but see NUMERALS, vol. xvii. p. 627). Perhaps Gerbert's chief claim to the remembrance of posterity is to be found in the care and expense with which he gathered together MSS. of the classical writers. His love for literature was a passion. In the turmoil of his later life he looked back with regret to his student days; and "for all his troubles philosophy was his only cure." Everywhere—at Rome, at Treves, at Moutier en-Der, at Gerona in Spain, at Barcelona—he had friends or agents to procure him copies of the great Latin writers for Bobbio or Rheims. To the abbot of Tours he writes that he is "labouring assiduously to form a library," and "throughout Italy, Germany, and Lorraine (Belgica) is spending vast sums of money in the acquisition of MSS." It is noteworthy, however, that Gerbert never writes for a copy of one of the Christian fathers, his aim being, seemingly, to preserve the fragments of a fast-perishing secular Latin literature. It is equally remarkable that, despite his residence on the Spanish mark, he shows no token of a knowledge of Arabic, a fact which is perhaps sufficient to overthrow the statement of his younger contemporary Adhemar as to his having studied at Cordova. There is hardly a trace to be found in his writings of any acquaintance with Greek.

So remarkable a character as that of Gerbert left its mark on the age, and fables soon began to cluster round his name. Towards the end of the 11th century Cardinal Benno, the opponent of Hildebrand, is said to have made him the first of a long line of magician popes. Orderic Vitalis improves this legend by details of an interview with the devil, who prophesied Gerbert's threefold elevation in the famous line that Gerbert's contemporaries attributed to the pope himself:

Transit in R. Gerbertus in R. post papa vigens R.

A few years later William of Malmesbury adds a love adventure at Cordova, a compact with the devil, the story of a speaking statue that foretold Gerbert's death at Jerusalem—a prophecy fulfilled, somewhat as in the case of Henry IV. of England, by his dying in the Jerusalem church of Rome,—and that imaginative story of the statue with the legend "Strike here," which, after having found its way into the *Gesta Romanorum*, has of late been revived in the *Earthly Paradise*.

Gerbert's extant works may be divided into five classes. (*a*) A collection of letters, some 230 in number. These are to be found for the most part in an 11th-century MS. at Leyden. Other important MSS. are those of the Barberini Library at Rome (late 16th century), of Middlehill (17th century), and of St Peter's abbey, Salzburg. With the letters may be grouped the papal decrees of Gerbert when Silvester II. (*b*) The *Acta Concilii Remensis ad Sanctum Basolum*, a detailed account of the proceedings and discourses at the great council of St Basle; a shorter account of his apologetic speeches at the councils of Mouzon and Causey, and drafts of the decrees of two or three other councils or imperial constitutions promulgated when he was archbishop of Ravenna or pope. The important works on the three above mentioned councils are to be found in the 11th century Leyden MS. just alluded to. (*c*) Gerbert's theological works comprise a *Sermo de Informatione Episcoporum* and a treatise entitled *De Corpore et Sanguine Domini*, both of very doubtful authenticity. (*d*) Of his philosophical works we only have one, *Libellus de Rationali et Ratione uti*, written at the request of Otto III. and preserved in an 11th century MS. at Paris. (*e*) His mathematical works consist of a *Regula de Abaco Computi*, of which a 12th century MS. is to be found at the Vatican, and a *Libellus de Numerorum Divisione* (11th and 12th century MSS. at Rome, Montpellier, and Paris), dedicated to his friend and correspondent Constantine of Fleury. A long treatise on geometry, attributed to Gerbert, is of somewhat doubtful authenticity. To these may be added a very short disquisition on the same subject addressed to Adalbold, and a similar one, on one of his own spheres, addressed to Constantine, abbot of Micy. All the writings of Gerbert are collected in the edition of M. Olleris. (T. A. A.)

SILVESTER III. When Boniface IX. was driven from Rome early in January 1044, John, bishop of Sabina, was elected in his stead and took the title of Silvester III. Within three months Boniface returned and expelled his rival. Nearly three years later (December 1046) the council of Sutri deprived him of his bishopric and priesthood. He was then sent to a monastery, where he seems to have died.

SIMANCAS, a walled town of Spain, $8\frac{1}{2}$ miles southwest from Valladolid, on the road to Zamora, is situated on the Pisuerga, here crossed by a fine bridge of seventeen arches. The population within the municipal boundaries was 1258 in 1885. In the north-western angle of the town stands the Archivo General del Reino, originally a fortified castle, to which the national archives of Spain were removed in 1563 (the suggestion was due to Ximenez). The extensive architectural alterations and repairs which were necessary were made under the direction of Herrera, Berruguete, and Mora, and the arrangement of the papers was entrusted to Diego de Ayala. They now occupy forty-six rooms, and are arranged in upwards of 80,000 bundles (30,000,000 documents), including important private as well as state papers, ambassadors' correspondence, and the like. The archives of the Indies, originally lodged here, were transferred in the 18th century to the Lonja of Seville. Permission to consult the documents at Simancas can now be readily obtained.

SIMBIRSK, a government of eastern Russia, on the right bank of the middle Volga, with Kazañ on the N., Samara on the E., Saratoff on the S., and Penza and Nijni-Novgorod on the W., has an area of 19,110 square miles, and a population (1882) of 1,471,164. It is occupied by the eastern parts of the great central plateau of middle Russia, which slowly rises towards the south, and gently slopes in the north towards the great Oka depression of the middle Volga. Its higher parts range from 750 to 1000 feet above the sea, and form the Zheguleff range of hills, which compel the Volga to make its great bend at Samara, while the numerous valleys and ravines which intersect it, and are excavated to a depth of 700 to 800 feet, give quite a hilly aspect to several parts of it, especially in the east, where it descends with abrupt crags towards the broad valley of the Volga. In the west a broad depression, traversed by numerous rivers and streams, extends along the left bank of the Sura. All geological formations, from the Carboniferous upwards, are met with in Simbirsk. The Volga flows for 300 miles along the eastern boundary, separating Simbirsk from Samara. The shallow Sviyaga rises in the Samarskaya Luka Hills and flows parallel to the Volga, at a distance of 2 to 20 miles, but in an opposite direction. The Sura, also flowing northwards, waters the western part of Simbirsk; it is navigable for more than 270 miles, and, as it is free from ice earlier than the Volga and flows towards central Russia, goods are sometimes transported by land to the Sura to be shipped on it when speedy transport is desired. Its tributaries—the Barysh, Alatyr (100 miles), Piyana, and others—are not navigable. The Usa (80 miles) and the Syzrañ (100 miles) flow east and join the Volga below the Samara bend. A few lakes and marshes are met with in the west of the government. The forests, although rapidly disappearing, still cover 3,894,800 acres, while of the remainder 5,930,600 acres are arable, 1,150,800 acres prairie and pasture land, and 605,600 acres uncultivable. In the north excellent forests of timber cover large areas, but in the south they are rare. The climate is severe, and the extremes are great. At Simbirsk the average temperature is 38°.7, but the thermometer sometimes reaches 114° F., and frosts of −47° F. are not uncommon; the average rain and snow fall is only 17.6 inches. South of the Samara Hills the climate is much less severe, and gardening, which is prosecuted with great difficulty in the north, flourishes there.

The population, which was but 1,192,510 in 1867, had reached 1,471,164 in 1882, of whom only 100,740 lived in towns. The

greater number (about two-thirds) are Great Russians, the remainder being Mordvinians (13 per cent.), Tchuvashes (9.3 per cent.), and Tartars (8.3 per cent.), with about 1000 Jews. The Mordvinians are chiefly settled in the north-west, in Ardatoff and Alatyr (40 and 26 per cent. of population), and on the Volga in Senghilei; the Tchuvashes make about one-third of the population of the districts of Buinsk and Kurmysh, contiguous to Kazañ; the Tartars constitute about 35 per cent. in Buinsk and 18 per cent. in Senghilei. Only the Tartars (about 100,000) are Mohammedans, the remainder being Greek-Orthodox or Dissenters. As in other Volga governments, the villages in Simbirsk are mostly large, many of them having from 3000 to 5000 inhabitants. Agriculture, favoured by a fertile soil, is the chief occupation, grain being exported or manufactured into spirit. Linseed and hempseed are cultivated for exportation, as also kitchen garden produce and some fruit. Bee-keeping is a favourite and remunerative occupation with Mordvinians, and fishing (sturgeon) is carried on in the Volga and the Sura. The timber-trade in the north and the shipbuilding on the Sura are considerable sources of wealth; wooden sledges and wheels are made and exported, as well as bags of lime-tree bast,—the last-named industry giving occupation to whole villages. Other petty trades, also carried on in conjunction with agriculture, are the manufacture of felts and felt hats, linen stuffs (especially among the Mordvinians), cottons, boots, and small metal wares. A characteristic feature of Simbirsk is the trade in wooden vessels, which are exported to Vyatka, Perm, Orenburg, Samara, and the Don, and there exchanged for cat, squirrel, and hare skins. Flour mills are numerous. Watered by the Volga and Sura, and moreover traversed in its southern portion by the railway connecting Orenburg and Samara with Penza and Ryazañ, by Batraki and Syzrañ, the government has an active trade. Its exports, however, are much below those of Samara and Saratoff. Batraki and Syzrañ are important centres of traffic, the aggregate amount of merchandise entered and cleared by rail and boat being respectively 2,435,000 and 2,000,000 cwts. (timber not included). The chief ports of lading on the Sura are Alatyr, Promzino-Gorodische, and Berezniki, each with exports valued at about 750,000 roubles. Corn, linseed, woollen stuffs, timber, potash, and wooden wares are the principal articles of trade.

Simbirsk is very backward as regards education. There were in 1882 only 462 schools (17,795 boys and 2663 girls) and 8 secondary schools (497 male and 516 female pupils).

The government is divided into eight districts, the chief towns of which, with their populations in 1880, are—Simbirsk (36,600), Alatyr (15,000), Ardatoff (4740), Buinsk (4130), Karsuñ (3740), Kurmysh (1930), Senghilei (3500), and Syzrañ (24,500). Kotyakoff (580) and Tagai (2400) have municipal institutions. The above-mentioned ports of lading are more important than most of the towns.

The first Russian settlers made their appearance in the Simbirsk region in the 14th century, but did not extend east of the Sura. Not till two centuries later did they cross the Sura and the district begin to be peopled by refugees from Moscow. The Zheguleff Mountains in the south still continuing to be a place of refuge for the criminal and the persecuted, Simbirsk was founded in 1648, and a palisaded earthen wall was built, running south-west of the new town, with small forts extending to the Sura. The region thus protected was soon settled, and, as the Russian villages advanced further south, Syzrañ was founded, and a second line of small forts, extending also towards the Sura, was erected. The colonizers settled rapidly, and the aboriginal Mordvinians soon adopted many of their customs, so as to lose their ethnographical individuality, especially within the last fifty years. Simbirsk received the name of an old Tartar settlement, Simbir, situated 9 miles south of the present town, on the opposite bank of the Volga.

SIMBIRSK, capital of the above government, is situated 576 miles east-south-east of Moscow, between the Volga and the Sviyaga, here separated by an isthmus only 2 miles broad. The central part of Simbirsk—the Crown (Vyenets), containing the cathedral and the best houses—is built on a hill 560 feet above the Volga, whence there is a beautiful view over the low left bank of the river. Adjoining is the trading part of Simbirsk, while farther down on the slope, towards the Volga, are scattered the store-houses, the shops for the sale of stoneware and other merchandise brought by the steamers and boats, and the poorest suburbs of the city; these last also occupy the western slope towards the Sviyaga. There are three suburbs on the left bank of the Volga, communication with them being maintained in summer by steamers. A great fire having destroyed nearly all the town in 1864, it has been again built on a new plan, still mostly of wood. The cathedral of St Nicholas dates from 1712. The new one, that of the Trinity, was erected by the nobility in commemoration of 1812. The old church of St Nicholas on the Karamzin Square is architecturally pleasing. A public garden has been laid out on the top of the Vyenets Hill and another in the outskirts of the city, while no fewer than three hundred private gardens, where fruits are grown for exportation, are scattered throughout the town. The historian Karamzin (born in 1766 in the vicinity of Simbirsk) has a monument here, and a public library bearing his name contains about 15,000 volumes. Gardening and fishing occupy many of the inhabitants. The trade is brisk, corn being the principal item, while next come potash, wool, fruits, wooden wares, and manufactured produce. The Simbirsk fair, having a turnover of some 6 million roubles, still maintains its importance. The population (24,600 in 1867) was 36,600 in 1880.

SIMEON (שמעון), second son of Jacob by Leah (Gen. xxix. 33). The tribe of Simeon, like that of Levi, was broken up at a very early period, under circumstances of which we have some indication in Gen. xxxiv. and xlix. (see ISRAEL, vol. xiii. p. 400 *sq.*, and LEVITES). In Judges i. the Simeonites appear as sharing the conquests of Judah in the extreme south of Canaan, but there is no mention of them in this region in 1 Sam. xxx., and the tribe is not named at all in the blessing of Moses. It reappears, however, in 1 Chron. iv. 24–43 (*cf.* xii. 25), and is reckoned to the kingdom of Ephraim (2 Chron. xv. 9, xxxiv. 6). The Arabian wars of Simeon spoken of in 1 Chron. iv. have been connected by Hitzig and others with a supposed Israelite kingdom of Massa, which they find in Prov. xxxi. 1, translating "Lemuel, king of Massa," and comparing Gen. xxv. 14 and Isa. xxi. 11 *sq.*, where, however, it is quite gratuitous to suppose an embassy to the prophet from Israelites in Arabia. The whole speculation and the further development of Dozy (*The Israelites in Mecca*) is fanciful; *cf.* Wellhausen, *Prolegomena*, Eng. tr., pp. 212 *sq.* The heroine of the book of Judith is made to be of the tribe of Simeon, but this book is quite unhistorical.

SIMEON OF DURHAM. See SYMEON.

SIMEON STYLITES. See MONACHISM, vol. xvi. p. 701.

SIMFEROPOL, the capital of the Russian government of Taurida, is situated in the south-western part of the Crimea, on the Salghir (which frequently becomes dry), 900 miles from Moscow. Occupying an admirable site on the northern slopes of the Tchatyr-dagh, it has on the eastern side many beautiful gardens, and is divided into two parts,—the European, well built in stone, and the Tartar, which consists of narrow and filthy streets peopled by Tartars and Jews. Although it has grown somewhat since the railway brought it into connexion with the rest of the empire, it still remains a mere administrative centre, without either manufacturing or commercial importance. The population was 16,550 in 1866 and 29,030 in 1881.

In the neighbourhood stood the small fortress Napoli, erected by Skilur, the ruler of Taurida, some hundred years before the Christian era, which existed until the end of the 3d century. Afterwards the Tartars had here their settlement Ak-metchet, which was in the 17th century the residence of the chief military commander of the khan, and had the name of Sultan-serai. In 1736 it was taken and burnt by the Russians, and in 1784, after the conquest of Crimea by the Russians, it received its present name and became the capital of Taurida.

SIMLA, a small district in the lieutenant-governorship of the Punjab, India, situated among the hills of the lower Himalayan system in 31° 6′ N. lat. and 77° 11′ E. long. It consists of several detached plots of territory, together comprising an area of only 18 square miles. The mountains of Simla and the surrounding native states compose the southern outliers of the great central chain of the eastern Himalayas. They descend in a gradual series from the

main chain to the general level of the Punjab plain, forming a transverse south-westerly spur between the great basins of the Ganges and the Indus. A few miles north-east of Simla the spur divides into two main ridges, one following the line of the Sutlej in a north-westerly direction, and the other, crowned by the sanatorium of Simla, trending south-eastwards, till it meets at right angles the mountains of the outer Himalayan system. South and east of Simla the hills between the Sutlej and the Tons centre in the great peak of Chor, 11,982 feet above the sea. Throughout all the hills forests of deodar abound, while rhododendrons clothe the slopes up to the limit of perpetual snow. The principal rivers here are the Sutlej, Pabar, Giri Ganga, Chambar, and Sarsa. The scenery of the immediate neighbourhood of Simla is very grand and picturesque, presenting a series of magnificent views. The climate is considered highly salubrious and admirably adapted to European constitutions; the district has therefore been selected as the site of numerous sanatoria and cantonments. The average annual rainfall amounts to about 72 inches.

The population of the district in 1881 was 42,945 (males 27,593, females 15,352); Hindus numbered 32,428, Mohammedans 6935, and Christians 3353. Cultivation is widely carried on in all the lower valleys of the hills, and the fields are sown with maize, pulses, or millet for the autumn and with wheat for the spring harvest. Poppy, hemp, turmeric, ginger, and potatoes form the principal staples raised for exportation to the plains. The trade of the district centres mainly in the bazaars of Simla, which forms a considerable entrepôt for the produce of the hills. Another important trade-centre is the town of Rampur on the Sutlej, from which the great part of the shawl-wool (*pashm*) finds its way for exportation to British India.

The acquisition of the patches of territory forming the district dates from various times subsequent to the close of the Gúrkha War in 1815-16, which left the British in possession of the whole tract of hill country from the Gogra to the Sutlej. Kumáun and Dehra Dun were annexed to the British dominions, but the rest, with the exception of a few localities retained as military posts and a portion sold to the raja of Patiala, was restored to the hill rajas, from whom it had been wrested by the Gúrkhas. Garhwal state became attached to the North Western Provinces, but the remaining principalities rank among the dependencies of the Punjab, and are known collectively as the Simla Hill States, under the superintendence of the deputy-commissioner of Simla, subordinate to the commissioner at Ambálá.

SIMLA, the administrative headquarters of the above district, and the summer capital of India, stands at an elevation of 7084 feet above sea level. Since the administration of Sir John Lawrence (1864) it has been the resort, during the hot weather, of the successive governors-general of India, with their secretaries and headquarters establishments. In 1881 it had a population of 13,258.

SIMMS, WILLIAM GILMORE (1806–1870), an American poet, novelist, and historian, was born at Charleston, S.C., April 17, 1806, of Scoto-Irish descent. His mother died during his infancy, and his father having failed in business, and joined Coffee's brigade of mounted Indian fighters, which kept him in the Seminole country, young Simms was brought up by his grandmother, who gave him as good an education as her limited means would allow. He was clerk in a drug store for some years, and afterwards studied law, the bar of Charleston admitting him to practice in 1827, but he soon abandoned his profession for literature. At the age of eight he wrote verses, and in his 19th year he produced a *Monody on Gen. Charles Cotesworth Pinckney*. Two years later, in 1827, *Lyrical and Other Poems* and *Early Lays* appeared; and in 1828 he began journalism, editing with conspicuous ability and partly owning the *City Gazette*—a paper opposed to the doctrine of nullification. The enterprise failed, and the editor devoted his attention entirely to letters, and in rapid succession published *The Vision of Cortes, Cain, and other Poems* (1829), *The Tricolor, or Three Days of Blood in Paris* (1830), and his strongest poem, *Atalantis*, a story of the sea (1832). *Atalantis* established his fame as an author, and *Martin Faber*, the story of a criminal, his first tale, written in the following year, was warmly received. From this time forward his writings became very abundant; a classified list is given below. Though sensational and full of excessive colouring, they are held in good repute in the Southern States. During the American Civil War Simms espoused the side of the Secessionists in a weekly newspaper, and suffered damage at the hands of the Federal troops when they entered Charleston. He held a seat in the State legislature for some years, and the university of Alabama conferred on him the degree of LL.D. He died at Charleston on 11th June 1870.

In addition to the works mentioned above, Simms published the following poetry:—*Southern Passages and Pictures*, lyrical, sentimental, and descriptive poems, 1839; *Donna Florida*, 1843; *Grouped Thoughts and Scattered Fancies*, sonnets, 1845; *Areytos, or Songs of the South*, 1846; *Lays of the Palmetto*, 1848; *The Eye and the Wing*, 1848; *The Cassique of Accabee, a Tale of Ashley River*, with other pieces, 1849; *The City of the Silent*, 1850. To dramatic literature he contributed *Norman Maurice, or the Man of the People*; *Michael Bonham, or the Fall of the Alamo*; and a stage adaptation of *Timon of Athens*, all of which have been acted with success. His revolutionary romances are—*The Partisan*, 1835; *Mellichampe*, 1836; *Katherine Walton, or the Rebel of Dorchester*, 1851; *The Scout* (originally *The Kinsman*), *or the Black Riders of the Congaree*, 1841; *Woodcraft* (originally named *The Sword and the Distaff*), and *Eutaw*, 1856. These tales describe social life at Charleston, and the action covers the whole revolutionary period, with faithful portraits of the political and military leaders of the time. Of border tales the list includes *Guy Rivers, a Tale of Georgia*, 1834; *Richard Hurdis*, 1838; *Border Beagles*, 1840; *Beauchampe*, 1842; *Helen Halsey*, 1845; *The Golden Christmas*, 1852; and *Charlemont*, 1856. The historical romances are *The Yemassee*, 1835, by far the greatest of his works, and dealing largely with Indian character and nature; *Pelayo*, 1838; *Count Julien*, 1845; *The Damsel of Darien*, 1845; *The Lily and the Totem*; *Vasconselos*, 1857, which he wrote under the assumed name of "Frank Cooper"; and *The Cassique of Kiawah*, 1860. Other novels, belonging to the series of which *Martin Faber* was the first, and treating principally of domestic life and motive, are *Carl Werner*, 1838; *Confession of the Blind Heart*, 1842; *The Wigwam and the Cabin*, a collection of short tales, 1845-46; *Castle Dismal*, 1845; and *Marie de Berniere*, 1853. Simms's other writings comprise a *History of South Carolina*; *South Carolina in the Revolution*, 1854; *A Geography of South Carolina*; lives of *Francis Marion*, *Capt. John Smith*, *The Chevalier Bayard*, and *General Greene*; *The Ghost of my Husband*, 1866; and *War Poetry of the South*,—an edited volume,—1867. Simms was also a frequent contributor to the magazines and literary papers, six of which he founded and conducted. He wrote on a great variety of subjects, and discussed with spirit and boldness the leading political, social, and literary topics of the day. In the discussion on slavery he upheld the views of the pro-slavery party. He edited the seven dramas ascribed to Shakespeare, with notes and an introduction to each play. In the capacity of lecturer and orator, he was in frequent request on public occasions. His principal orations are *The Social Principle the True Secret of National Permanence*, 1842; *The True Sources of American Independence*, 1844; *Self-Development*, 1847; *Poetry of the Practical*; *The Battle of Fort Moultrie*; and *The Moral Character of Hamlet*.

SIMON MAGUS. In the extant documents of the first three centuries we meet with Simon Magus in a threefold aspect:—(1) as Samaritan Messiah attempting by the aid of Christianity to establish a new religion; (2) as founder of a school of Gnostics and as father of heresy; (3) as a caricature of the apostle Paul. The Tubingen critics (Baur, Volkmar, Zeller, Lipsius, and until the year 1878 Hilgenfeld also) have tried to show that the oldest accounts are those in which Simon is represented in the last-named aspect; they have accordingly denied his existence, maintaining that all the features attributed to him in the oldest sources are accounted for by the life and personality of Paul. In particular they would explain Simon's visit to Rome by the apostle's journey thither, and further would have it that the church tradition of Peter's having gone to Rome arose solely out of the supposition that the great apostle who had withstood the Paul-Simon everywhere else must have followed up his

victory in the capital of the world also. According to this view, Simon Magus is an invention of the Jewish Christians, a distorted Paul, whom the church at large partly accepted as historical and partly catholicized, adding fresh touches to the picture of Simon, making him the father of all the heresies, the head of all the magi, a pseudo-Messiah, and so forth, but at last destroying the whole point of the story by adding that Peter and Paul had jointly overcome the magian in Rome.

Were this view of the Tubingen critics established, their whole conception of apostolic and post-apostolic times would also be proved; it would have been made out (1) that legends of an anti-Pauline tendency form the basis of the tradition of the church; (2) that the Acts of the Apostles is a compromise, and rests upon Jewish-Christian myths in part no longer understood; (3) that the ecclesiastical tradition about Peter's journeyings had its origin merely in those of Paul; and (4) there would be established an indisputable example of the production of biassed and fabricated history within primitive Christianity so remarkable that upon the ground of it alone we should be justified in simply regarding the greater part of the historical statements of the first two Christian centuries as deliberate inventions.

But on no other point are the proofs of the Tubingen school weaker than in this. Only by inverting the historical order of the original documents, by dint of violent assertion, and by declaring with reference to the most important arguments that they existed in writings which now are lost, has it been possible for them to give even the appearance of stability to their hypothetical structure. The three assertions of the Tubingen critics —(1) that the written sources of the pseudo-Clementine *Homilies* and *Recognitions* go back to the 1st century, (2) that already in these Paul has become distorted into Simon Magus and Peter is represented as having combated the Simon-Paul in Rome, and (3) that the Acts of the Apostles, Justin, and other church fathers in their statements about Simon and about Peter's stay in Rome depend upon these Jewish-Christian writings—can none of them be proved. On the other hand,—apart from the Acts of the Apostles,—the existence of a Samaritan magus, Simon, in apostolic times, as well as of a sect of Simonians in the 2d century (in Samaria, and elsewhere in the Roman empire), is quite conclusively attested through Justin Martyr, and also through Celsus, Clement, Hippolytus, and Origen.[1] Even the Tubingen critics themselves could not deny the existence of a sect of Simonians; they have therefore been obliged to advance the desperate theory that the sect arose solely on the basis of the Jewish-Christian romance of Simon.

The oldest account of Simon Magus occurs in the Acts of the Apostles. When Philip the evangelist came to Samaria about 37 A.D. he found a great religious movement going on. One named Simon had given himself out for some great person, and by dint of his extraordinary works had stirred up and gained over the whole population, who took him for the exalted manifestation of the Divine Power itself. Philip converted the majority of Simon's adherents, and Simon himself, amazed at the deeds wrought by Philip, received baptism, and joined the evangelist's society. Peter and John then came to Samaris to impart to the baptized the Holy Ghost by the laying on of hands; and Simon offered the apostles money to invest him with a like power of conferring the gift. But Peter sternly rebuked him, exhorting him to repent and beseech God that the evil thought of his heart might be forgiven him. Simon thereupon begged the apostles to pray on his behalf. We have no means of checking this account, since we possess no other independent source. The author of the Acts seems to have known nothing of Simon Magus from other quarters, else he would hardly have closed the narrative as we have it. Simon is not yet viewed as hostile to Christianity. There is no justification for doubt as regards the main points of this account. That in the fourth decade of the 1st century a pseudo-Messiah, named Simon, appeared in Samaria; that he gained a considerable following, that he tried to effect a union with the Christian missionaries, who, however, soon perceived his real character and shook him off,—these facts must be treated as historical.[2] They are vouched for by Justin, whose statement is not borrowed from the Acts.[3] Justin, it is true, makes no direct statement about any relations whatever between Simon and Christianity, but represents him as one who gave himself out for God and as the founder of an entirely new religion; but, since on the other hand he groups him with Menander and Marcion, and thinks of him as the devil-sent father of heretics, it is plain that he knew quite well of some relation between Simon and the Christians.

The conception of Simon as the father of heresy within the church is in no way suggested in the Acts; nor has Justin in the writings which we possess given any hint of a reason why Simon should be viewed in such a light. But the testimony of the Acts (viii. 13) that Simon received baptism and for a while joined himself to the Christians, enables us at least in some degree to understand how he afterwards got the reputation alluded to. We shall see presently, moreover, that Simon must have introduced certain Christian elements into his teaching.[4]

Justin has a good deal more about Simon that is not to be found in Acts:—(1) he gives his birthplace as Gittha in Samaria; (2) he states that Simon came to Rome in the reign of Claudius, and there by his magical arts gained some followers, and was taken for a god, and that a statue was erected to him on the Tiber Island with the inscription SIMONI DEO SANCTO; and (3) he states that the adherents of Simon passed off a woman named Helena,

---

[1] The testimony of Justin derives its great importance from the fact that he was himself a Samaritan; he says expressly (*Apol.*, ii. 15; see also *Dial.*, 120), τοῦ ἐν τῷ ἐμῷ ἔθνει ἀσεβοῦς καὶ πλάνου Σιμωνιανοῦ διδάγματος κατεφρόνησα. In *Apol.*, i. 26 he makes direct reference to Simon (see also i. 56), and remarks, καὶ σχέδον πάντες μὲν Σαμαρεῖς, ὀλίγοι δὲ καὶ ἐν ἄλλοις ἔθνεσιν, ὡς τὸν πρῶτον θεὸν Σίμωνα ὁμολογοῦντες, Σίμωνα καὶ προσκυνοῦσι. Celsus (quoted in Orig., *C. Cels.*, v. 62) alludes to a sect of Simonians, and says they were also called Helenians; Irenæus (*Adv. Hær.*, i. 23) is acquainted with the ritual and writings of this sect; Hippolytus (*Philosoph.*, vi. 7–20) gives extracts from a Simonian book Ἀπόφασις μεγάλη. Particularly interesting is the testimony of Origen (*C. Cels.*, i. 57; *cf.* vi. 11). 'Also Simon Magus, the Samaritan, wished to gain disciples by his magical arts. His impositions were virtually without result at the time, while at present, in my belief, the number of his adherents throughout the world does not amount to thirty. And perhaps this estimate is too high. At most there are only a few in Palestine, while in the other parts of the world where he desired to make his name illustrious it is quite unknown. Where it is known, the fact is entirely due to the Acts of the Apostles. Christians alone still speak of him." Some would fain find a testimony in Josephus also; but the Jewish conjurer Simon, of Cyprus, mentioned in *Ant.*, xx. 7 has nothing whatever to do with the Samaritan. Renan would recognize Simon Magus in the second beast of Rev. xiii.; but this hypothesis is utterly baseless.

[2] The same historical certainty cannot be claimed for the meeting of Peter and Simon, because in the Acts (ch. i.–xv.) Peter is throughout pushed to the front, and because the motive assigned for his journey to Samaria is open to some suspicion. Still, the fact that even in the Jewish-Christian Acts of the Apostles Peter and Simon have personal dealings affords presumptive evidence that they did meet.

[3] Unfortunately, Justin's *Syntagma* against the heretics, in which he dealt at greater length with Simon, is no longer extant; we are therefore limited to the meagre references in his *Apology* and *Dialogue*, and the statements of later writers who had read the *Syntagma*.

[4] Justin repeatedly and emphatically says that Simon pretended to be a god, and was regarded by his adherents as the Supreme God; see *Dial.*, 120.

whom he brought to Rome with him, and who had previously been a prostitute in Tyre,[1] as the "first idea" (πρώτη ἔννοια) of Simon

As regards the first of these statements we may point to a Samaritan village "Gît" (Karjet-Gît), not quite 3 miles south-south-west from the town of Samaria[2] Justin's account in this particular seems trustworthy On the other hand, the allegation that a statue was erected to Simon in Rome is not authentic,[3] and consequently most critics have regarded the narrative of Simon's journey to Rome as legendary Some suppose that Justin was led only through the words of the inscription which he has wrongly referred to Simon to believe that Simon himself was in Rome, others (the Tubingen critics) think, on the contrary, that Justin had been already acquainted with the Jewish-Christian Acts of the Apostles, and had thence learned that Simon (Paul) had gone to Rome and that the inscription therefore only confirmed him in the belief of Simon's presence there But in either case the distinct assertion of Justin that Simon went to Rome in the time of Claudius remains unexplained, for the hypothesis that Justin added the arrival of Simon under Claudius because he already knew and credited the legend of Peter's having lived twenty-five years in Rome deserves no refutation Consequently we may assume—seeing there is absolutely no trace of any influence of the Jewish-Christian legend upon Justin—that in the Roman community, in the time of that author, a tradition was current that Simon Magus visited Rome in the reign of Claudius We are no longer in a position to test the trustworthiness of this tradition, but, seeing there is no indication of any tendency out of which it could have arisen, we have no ground for declaring it incredible The fact attested by Justin, Celsus, and Origen, that there were Simonians also beyond the limits of Samaria (ἐν ἄλλοις ἔθνεσιν), favours the view that Simon had travelled With reference, lastly, to the statement about Helena, we have to observe that here Justin has reported a doctrine not of Simon but of the Simonians Simon, we are to understand, came to Rome with a woman named Helena, and his adherents afterwards took her for the æon mentioned Justin gave fuller accounts of Helena and the doctrines of the Simonians in his *Syntagma*, and we know their substance from Hegesippus, Irenæus, Tertullian, pseudo-Tertullian, Epiphanius, and Philastrius Simon, it would appear, declared himself to be "the highest power"—the Supreme God Himself, he taught that among the Jews he manifested himself as the Son, in Samaria as the Father, and among other nations as the Holy Spirit Helena, whom he had purchased in a brothel at Tyre, he gave out to be his πρώτη ἔννοια, the mother of all, by whom he had called the angels and archangels into being She had proceeded from him, had been initiated into his purposes, had voluntarily come down from heaven and become the mother of the angels and powers who created this world, but after the completion of her work she had been laid under bonds by her own children, the world-creating angels, who desired to be independent, and who knew not the first father Simon, they imprisoned her in a human body, and subjected her to every affront, she had to migrate out of one body into another, she became, *e g*, that Helen on whose account the Trojan War was waged, finally she found herself in a brothel, out of which Simon at length rescued her, thereby fulfilling the parable of the lost sheep The supreme god—Simon—had come down in order to redeem his πρώτη ἔννοια, and to bring salvation to all men through the knowledge of himself He decided upon this descent on seeing that the angels, from their desire for supremacy, were in conflict with each other and were misgoverning the worlds He assumed every form necessary for the restoration of lost harmony to men he appeared as man, without being really a man, and in appearance he suffered in Judæa Henceforth it was a duty to believe in Simon and Helena, but to disbelieve the prophets, who were inspired by the world-creating angels, and not by Simon Believers in Simon are at liberty to do what they will, for by the grace of Simon should men be blessed—but not on account of good works Should a Simonian do anything wicked he is nevertheless undeserving of punishment, for he is not wicked by nature but only of his free-will, the law proceeded from the world-creating angels, who thought thereby to enslave their subjects, Simon, however, will bring the world to nought along with the dominion of those angels, and save all who believe on him To this it is added that the Simonians live dissolutely, vie with each other in the practice of magic, make use of exorcisms, charms, mystic formulas, &c, and further that they worship images of Simon (as Zeus) and of Helena (as Athene), under the names of "The Lord" and "The Lady"

We may regard this account, which, according to Irenæus, is partly based upon direct statements of the Simonians themselves, as essentially derived from the *Syntagma* of Justin[4] That we have here before us, not the genuine teaching of Simon, but the gnosis of the Simonians is very evident, this gnosis, however, is just as much bound up with the person of Simon as is the Christian gnosis with the person of Jesus Christ Simon is the manifested Deity Himself, but—and herein lies the Christian, or more properly the anti-Christian element—Simon is at the same time represented as Christ, *i e*, is identified with Christ The fusing together of Simon and Christ, a syncretistic-gnostic conception of the world and its creation, and an ethical antinomianism are the distinctive features of this new universal religion That we have here an attempt to found a new religion, and that a world-religion, upon the principle of embodying all important articles of the older ones, appears also from the fact that Simon is identified not only with Christ but also with Zeus, and that Greek legends and mythologies are utilized for the system We have therefore in Simonianism a rival system to Christianity, in which the same advantages are offered, and in which accordingly Christian elements are embodied, even Christ Himself being identified with the Supreme God (Simon) The attempt to establish such a system in that time of religious syncretism has nothing incredible about it, and in view of the religious conditions then prevailing in the locality it can easily be understood that it proceeded from a Samaritan

[1] This does not come directly from the extant manuscript of Justin's *Apology*, but from Eusebius's quotations (Euseb, *H E*, ii 13)

[2] See Lipsius, *Quellen der rom Petrussage*, p 34

[3] A happy accident of the rarest kind has put us in a position to correct Justin's statement In 1574 a stone which had once served as the base of a statue was dug out upon the Tiber Island It bore the following inscription SEMONI SANCO DEO FIDIO SACRVM (see Orelli, *Inscr*, vol i p 337 n, 1860) "Semo Sancus" is a Sabine god (Ovid, *Fast*, vi 213 *sq*, Lactantius, *Inst Div*, i c 15) The inscription having been found in the very place where, according to Justin, Simon's statue must have stood, most scholars suppose, and rightly, that Justin by mistake confounded "Semo Sancus" with "Simon Sanctus"

[4] This work must also have had something to say about the relations of Simon to other Samaritan pseudo-Messiahs, viz, to Dositheus, Cleobulus, and Menander (see Hegesippus, quoted by Eusebius, *H E*, iv 22), but the nature of its statements can no longer be with certainty ascertained We are in the dark especially as to the relation between Simon and Dositheus But the mere fact that in Samaria, in the time of the apostles, so many Messiahs purporting to be founders of religions should have appeared on the scene is extremely interesting It is a very noteworthy circumstance also that Justin, Hegesippus, and Irenæus knew nothing about Peter having met Simon in Rome, and having withstood him there

The basis of it was laid by Simon himself, who claimed to be a god and yet derived something from the Christian missionaries; but the development was due to his followers in the 2d century, who may have borne to the original Simonians exactly the same relation as did the Valentinians to the first Christians. From the circles of these later Simonians, who worshipped Simon especially under the mysterious name of "The Standing,"[1] a book was issued bearing the title Ἡ ἀπόφασις ἡ μεγάλη, from which Hippolytus has given us extracts in the *Philosophumena*. From these it appears—as indeed might have been expected from the statements of Irenæus (Justin)—that the later Simonianism combined the worship of Simon with a complicated Gnostic system, for which it utilized the Greek mythology, as well as isolated sayings of the Old Testament, of the Gospels, and of the apostolic epistles. In point of form, design, medium, and relationship to Christianity, Simonianism bears a striking resemblance to Manichæism, which sprang up two centuries later; but Mani did not so bluntly as Simon lay claim to be a god, and the Manichæans never had the hardihood to proceed to absolute identification of Mani with Christ; as regards their tenets, however, and viewed as attempts to found a universal religion, Simonianism and Manichæism are widely different.

We can understand, then, how it was that the Christians in the 1st and 2d centuries regarded Simon as the emissary of devils and the father of all heresy; and we can also understand why—apart from Samaria—this effort to establish a new religion bore little fruit. It rests upon falsifications and a wild jumbling of religions, while it is lacking in religious elements of its own.

Until about the year 220 ecclesiastical tradition knows Simon only as a devil-inspired founder of a religion, and as father of heresy; it sees in him a caricature of Christ, not of the apostle Paul, and it knows nothing about Peter having again confuted him after what is narrated in Acts viii. It knows indeed that Simon came to Rome in the time of Claudius, but previous to the 3d century no ecclesiastical writer mentions his having met with Peter there, although all state that Peter went to the capital. The first ecclesiastical author to combine the two traditions was Hippolytus (*Philos.*, vi. 20). Having referred to the events narrated in Acts viii., he proceeds: "Simon even went to Rome, and there met with the apostles. As he led many astray through his sorceries, Peter frequently withstood him. He came at last ...[2] and taught sitting under a plane-tree. When after lengthened reasoning Simon was on the point of being worsted, he declared that if he were to be buried alive he would on the third day rise again. He actually caused a grave to be dug for him by his disciples, and gave orders that he should be buried. The disciples did as they were bid; he remains in the grave, however, unto this day, for he was not Christ." This legend is found only in Hippolytus; it evidently corresponds with the idea that Simon was a false Christ, but has no relation whatever with the notion that he was Paul. Hippolytus, moreover, does not say that in Rome Simon met with Peter only, but with the apostles, *i.e.*, with Paul and Peter. The origin of the legend is very intelligible from what we know of the historical premisses. Given that Simon alleged himself to be Christ, that in Samaria he met with Peter, that he as well as Peter afterwards travelled to Rome, then we can very easily explain the origin of a legend which brings Peter once more into personal contact with Simon in Rome, and alleges that Simon became the victim of his nefarious mimicry of Christ.

At the same time the expression Πρὸς Σίμωνα πολλὰ Πέτρος ἐν Ῥώμῃ ἀνακατέστη makes it seem a probable thing to many that Hippolytus already knew of that legend about Simon in which the Tübingen critics think they have found the key to all traditions about him. In the pseudo-Clementine *Recognitions* and *Homilies*, or rather in their documentary sources, Simon plays a very important part. He appears as the representative of all possible heresies, and as the great antagonist of Peter, who followed him up throughout Samaria and the east coast of the Mediterranean, engaging him in great disputations, and always coming off the victor. Some of the features attributed in these legends to Simon are indisputably borrowed from the apostle Paul, others from Marcion, others from Valentinus and Basilides. These legends therefore arose in strict Jewish-Christian anti-Pauline circles; we find them, however, in the *Recognitions* and *Homilies* already subjected to catholic revision. This revision cannot have taken place before the first half of the 3d century, and probably is of much later date. The age of the documentary sources cannot be exactly determined; they may be very old; but what is of most importance is (1) that their influence upon church tradition cannot be traced before the 3d century, and (2) that in those Jewish-Christian sources, as well as in the *Homilies* and *Recognitions* themselves, only disputations between Peter and Simon in Samaria and adjacent countries are narrated, nothing whatever being said of any controversies between Simon and Peter in Rome. Even if, therefore, the Simon of the Jewish-Christians bears unmistakable traces of Paul, it is also true on the other hand that these Jewish-Christians knew nothing of a journey of Simon to Rome. Hence all the combinations of the Tübingen critics as to the origin of the "Peter tradition," and as to the origin of the statement that Simon came to Rome, completely fall to the ground. Hippolytus was the first to combine "Peter in Rome" and "Simon in Rome," without knowing anything whatever of a Simon-Paul legend. Not until after his day, after the Jewish-Christian legends had become naturalized in the catholic church through the medium of the *Recognitions* and *Homilies*, did these legends become current within the church, and only there. It now began to be told that Paul and Peter[3] had gone to Rome to withstand Simon. Simon was now represented partly in accordance with those Jewish-Christian legends, the tendency of which was not understood. Much, however, that was new was added, such as that Simon appeared before the emperor, that he miserably perished in attempting to fly, and so on. From the 3d (or rather 4th) century the Simon of church tradition becomes invested with some features of Paul in a distorted form. The *Recognitions*, as translated by Rufinus, were extensively read in the East, and, along with the Acts of the Apostles, kept fresh the memory of the great magian and his Helena in the Middle Ages. Simon also came to figure in popular literature. "Doctor Faustus" has preserved several traits of the ancient magian. Neither are Pauline characteristics wanting in the legendary Faustus; they are traceable even in the *Faust* of Goethe, the "homunculus" of the Simon-Faust being originally a travesty of the "new man" who according to Paul is created through the Gospel. It was not only as the great magian, however, that Simon remained known to the Middle Ages, but also as the first who attempted to purchase spiritual gifts with money, an association made permanent in the word "simony."

[3] See *Acta Pauli et Petri*.

SIMON, ABRAHAM (1622–1692), medallist and modeller, was born in Yorkshire in 1622 He was originally intended for the church, but turned his attention to art, and, after studying in Holland, proceeded to Sweden, where he was employed by Queen Christina, in whose train he travelled to Paris He returned to England before the outbreak of the Civil War, and attained celebrity by his medals and portraits modelled in wax During the Commonwealth he executed many medals of leading Parliamentarians, and at the Restoration he was patronized by Charles II, from whom he received a hundred guineas for his portrait designed as a medal for the proposed order of the Royal Oak Having incurred the displeasure of the duke of York, he lost the favour of the court, and died in obscurity in 1692 Among the more interesting of his medals are those of the second earl of Dunfermline, the second earl of Lauderdale, and the first earl of Loudon, that of the duke of Albemarle, and many other fine medals, were modelled by Abraham Simon and chased by his younger brother Thomas, noticed below

SIMON, RICHARD (1638–1712), the "father of Biblical criticism," was born at Dieppe on the 13th May 1638 His early studies were carried on at the college of the Fathers of the Oratory in that city He was soon, by the kindness of a friend who discerned the germs of those talents which were afterwards to render him so celebrated, removed to Paris and enabled to enter upon the study of theology, where he early displayed a taste for Hebrew and other Oriental languages He was allowed great indulgence in the prosecution of his studies by the authorities of the Congregation of the Oratory, being exempted from those exercises of piety which for an entire year were binding on the other students This dispensation aroused the ill-will and jealousy of the other Oratorian novitiates Simon was charged with reading "heretical" books, this designation being applied to *Walton's Polyglott*, the *Critici Sacri*, and other works of a similar kind But this jealous opposition proved abortive Simon, after investigation, was allowed and encouraged to continue his favourite pursuits At the end of his theological course he was sent, according to custom, to teach philosophy at Juilly, where there was one of the colleges of the Oratory But he was soon recalled to Paris, and employed in the congenial labour of preparing a catalogue of the Oriental books in the library of the Oratory This gave him full access to those works, the fruits of the study of which appear so fully in his after writings. His first essay in authorship was the publication of a work entitled *Fides Ecclesiæ Orientalis, seu Gabrielis Metropolitæ Philadelphiensis Opuscula, cum interpretatione Latina, cum notis* (Paris, 1671), the object of which was to demonstrate that the belief of the Greek Church regarding the Eucharist was the same as that of the Church of Rome Simon entered the priesthood in 1670, and the same year wrote a pamphlet in defence of the Jews of Metz, who had been accused, as they have so often been before and since, of having murdered a Christian child It was shortly before this time that there were sown the seeds of that enmity with the Port Royalists which filled Simon's after life with many bitter troubles The famous Arnauld had written a work on the *Perpetuity of the Faith*, the first volume of which treated of the Eucharist M Diroys, a doctor of theology, and a friend of Arnauld's, asked Simon his opinion of the book Simon replied that it was one of the best works which had been published by the Port Royalists, but that it nevertheless required correction in several important passages, and agreed reluctantly, and after some delay, at Diroys's request, to write a letter referring to these passages, on the understanding that the original was to be returned to him The criticisms of Simon excited great indignation among the friends and admirers of Arnauld, and he felt the effects of their vindictiveness to the latest hour of his life Another matter was the cause of inciting against him the ill-will of the monks of the Benedictine order A friend of Simon's, one of the Oratorians, was engaged in a lawsuit, in his capacity as grand vicar of Prince Neubourg, abbé of Fécamp, with the Benedictine monks of that establishment Simon lent to his friend the aid of his powerful pen, and composed a memorandum in which he employed pretty strong language against the opponents of his friend They were greatly exasperated, and made loud complaints to the new general of the Oratory that they were virulently assailed by a member of the brotherhood, with which they had always been on friendly terms The charge of Jesuitism was also brought against Simon, apparently on no other ground than that his friend's brother was an eminent member of that order The commotion in ecclesiastical circles was great, and it was seriously contemplated to remove Simon not only from Paris but from France A mission to Rome was proposed to him, but he saw through the design, and, after a short delay dictated by prudential motives, declined the proposal He was engaged at the time in superintending the printing of his *Histoire Critique du Vieux Testament* He had hoped, through the influence of Père la Chaise, the king's confessor, and the Duc de Montausier, to be allowed to dedicate the work to Louis XIV, but as His Majesty was absent in Flanders at the time the volume could not be published until the king had accepted the dedication, though it had passed the censorship of the Sorbonne, and the chancellor of the Oratory had given his *imprimatur* The printer of the book, in order to promote the sale, had caused the titles of the various chapters to be printed separately, and to be put in circulation These, or possibly a copy of the work itself, had happened to come into the hands of his ever-watchful enemies—the Port Royalists It seems that, with a view to injure the sale of the work, which it was well known in theological circles had been long in preparation by Simon, the Messieurs de Port Royal had undertaken a translation into French of the Prolegomena to *Walton's Polyglott* To counteract this proceeding Simon announced his intention of publishing an annotated edition of the Prolegomena, and actually added to the *Critical History* a translation of the last four chapters of that work, which had formed no part of his original plan Simon's announcement prevented the appearance of the projected translation, but his enemies were all the more irritated against him on that account They had now obtained the opportunity, which they had long been seeking, of gratifying their hatred of the bold Oratorian The freedom with which Simon expressed himself on various topics, and especially those chapters in which he declared that Moses could not be the author of much in the writings attributed to him, especially aroused their opposition The powerful influence of Bossuet, at that time tutor to the dauphin, was invoked, the chancellor Le Tellier lent his assistance, a decree of the council of state was obtained, and after a series of paltry intrigues the whole impression, consisting of 1300 copies, was seized by the police and destroyed, and the animosity of his colleagues in the Oratory rose to so great a height against Simon for having so seriously compromised their order by his work that he was declared to be no longer a member of their body Full of bitterness and disgust Simon retired to the curacy of Bolleville, to which he had been lately appointed by the vicar-general of the abbey of Fécamp

The work thus confiscated in France it was proposed to republish in Holland Simon, however, at first opposed this, in hopes of overcoming the opposition of Bossuet by

making certain changes in the parts objected to. The negotiations with Bossuet lasted a considerable time, but finally failed, and the *Critical History* appeared, with Simon's name on the title page, in the year 1685, from the press of Reenier Leers in Rotterdam. An imperfect edition had previously been published at Amsterdam by Daniel Elzevir, based upon a MS. transcription of one of the copies of the original work which had escaped destruction and had been sent to England, and from which a Latin and an English translation were afterwards made. The edition of Leers was a reproduction of the work as first printed, with a new preface, notes, and those other writings which had appeared for and against the work up to that date.

The work which had excited so much controversy and opposition consists of three books, the first of which deals with questions of Biblical criticism, properly so called, such as the text of the Hebrew Bible and the changes which it has undergone down to the present day, the authorship of the Mosaic writings and of other books of Scripture, with an exposition of his peculiar theory of the existence during the whole extent of Jewish history of recorders or annalists of the events of each period, whose writings were preserved in the public archives, and the institution of which he assigns to Moses. The second book gives an account of the principal translations, ancient and modern, of the Old Testament, and the third contains an examination of the principal commentators. He had, with the exception of the theory above mentioned, contributed nothing really new on the subject of Old Testament criticism, for previous critics, as Cappellus, Morinus, and others, had established many points of importance, and the value of Simon's work consisted chiefly in bringing together and presenting at one view the results of Old Testament criticism. The work is written in a clear style, and its tone is confident and frequently sarcastic. He displays great contempt for tradition and the opinions of the fathers. This latter peculiarity it was which specially aroused the enmity of Bossuet and other leading Romanists. But it was not only from the Church of Rome that the work encountered strong opposition. The Protestants felt their stronghold—an infallible Bible—assailed by the doubts which Simon raised against the integrity of the Hebrew text. Le Clerc ("Clericus"), the distinguished Dutch divine and critic, in his work *Sentimens de quelques Theologiens de Hollande*, controverted the views of Simon, and was answered by the latter in a tone of considerable asperity in his *Reponse aux Sentimens de quelques Theologiens de Hollande*, which he signed under the name of Pierre Ambrun, it being a marked peculiarity of Simon rarely to give his own name, but to assume *noms de guerre* at various times.

The remaining works of Simon may be briefly noticed. In 1689 appeared his *Histoire Critique du Texte du Nouveau Testament*, consisting of thirty-three chapters, in which he discusses the origin and character of the various books, with a consideration of the objections brought against them by the Jews and others, the quotations from the Old Testament in the New, the inspiration of the New Testament (with a refutation of the opinions of Spinoza), the Greek dialect in which they are written (against Salmasius), the Greek MSS. known at the time, especially Codex D (Cantabrigiensis), &c. This was followed in 1690 by his *Histoire Critique des Versions du Nouveau Testament*, where he gives an account of the various translations, both ancient and modern, and discusses the manner in which many difficult passages of the New Testament have been rendered in the various versions. In 1693 was published what in some respects is the most valuable of all his writings, viz., *Histoire Critique des principaux Commentateurs du Nouveau Testament depuis le commencement du Christianisme jusques à notre temps*. This work exhibits immense reading, and the information it contains is still valuable to the student. The last work of Simon that we shall mention is his *Nouvelles Observations sur le Texte et les Versions du Nouveau Testament* (Paris, 1695), which contains supplementary observations upon the subjects of the text and translations of the New Testament.

Simon is described as a man of middle stature, with somewhat unprepossessing features. His temper was sharp and keen, and as a controversialist he displayed a bitterness of tone and an acerbity of expression which tended only to aggravate the unpleasantness of controversy. He was entirely a man of intellect, free from all tendency to sentimentality, and with a strong vein of sarcasm and satire in his disposition. His reading was immense, and his memory powerful and retentive. He is said to have usually prosecuted his studies lying on the floor of his apartment, on a pile of carpets or cushions. Few men have written more that is worth reading on Biblical subjects than he, considering the hardships and vicissitudes of his chequered life. He died at his native city of Dieppe on the 11th April 1712, at the age of seventy-four.

The principal authorities for the life of Simon are the life or "eloge" by his grand-nephew De la Martiniere in vol. i. of the *Lettres Choisies*, 4 vols., Amsterdam, 1730; Graf's article in the first vol. of the *Beitr. z. d. Theol. Wissensch.*, &c., Jena, 1851; Reuss's article in Herzog's *Encyklopadie*, vol. xiv., new ed.; *Richard Simon et son Vieux Testament*, by A. Bernus, Lausanne, 1869. For the bibliography, see, in addition to the various editions of Simon's works, the very complete and accurate account of Bernus, *Notice Bibliographique sur Richard Simon*, Basel, 1882. (F. C.)

SIMON, Thomas (1623?–1665), medallist, was born, according to Vertue, in Yorkshire about 1623. He studied engraving under Nicholas Briot, and about 1635 received a post in connexion with the Mint. In 1645 he was appointed by the Parliament joint chief engraver along with Edward Wade, and, having executed the great seal of the Commonwealth and dies for the coinage, he was promoted to be chief engraver to the mint and seals. He produced several fine portrait medals of Cromwell, one of which is copied from a miniature by Cooper. After the Restoration he was appointed engraver of the king's seals. On the occasion of his contest with the brothers Roettiers, who were employed by the mint in 1662, Simon produced his celebrated crown of Charles II., on the margin of which he engraved a petition to the king, setting forth the excellence of his own productions and praying for redress. This is usually considered his masterpiece. An impression of the coin fetched £225 at an auction in 1832. This admirable medallist is believed to have died of the plague in London in 1665.

A volume of *The Medals, Coins, Great Seals, and other Works of Thomas Simon, engraved and described by George Vertue*, was published in 1753.

SIMONIDES (or Semonides, as some write the name) of Amorgos stands midway both in time and reputation between the other two iambic poets of Greece—Archilochus and Hipponax. A native of Samos, he led a colony to the island of Amorgos in the Archipelago, and lived there about 660 B.C. in Minoa, a town of his own founding. Besides two books of iambics, we are told that he wrote elegies, and a poem on the early history of the Samians, but only one insignificant elegy has been with any degree of plausibility attributed to him. We possess about thirty fragments of his iambic poems, written in clear and vigorous Ionic, with much force and no little harmony of versification. With Simonides, as with Archilochus, the iambic is still the vehicle of bitter satire, interchanging with melancholy, but in Simonides the satire is rather general than individual, and in other respects, especially in his gnomic and reflective tendency, he paves the way for the tragic trimeter. One of his two longer fragments dwells pathetically upon the misery of our lot, in which, as he says elsewhere, "we have many years of death, but of life only a few sad years"; the other, far his most famous poem, is a "Pedigree of Women," tracing their descent from different animals according to their different characters. The idea may have been suggested by the beast fable, as we find it in Hesiod and Archilochus; it is clear at least that Simonides knew the works of the former. The same conception recurs a century later in Phocylides. Simonides derives the dirty woman from a hog, the cunning from a fox, the fussy from a dog, the apathetic from earth, the capricious from sea-water, the stubborn from an ass, the incontinent from a weasel, the proud from a high-bred mare, the worst and ugliest from an ape, and the good woman from a bee. The remainder of the poem (vv. 96–118) is undoubtedly spurious. There is much beauty and feeling in Simonides's description of the good woman, and the skilful portraits of character and

judicious selection of prominent features prove him to have been a keen observer and a real artist. The date of his death is unknown.

See Bergk, *Poetæ Lyrici Græci*, vol. ii., Leipsic, 1882, pp. 441–459. There is a translation in English verse of part of the poem on women in Mure's *Hist. of Gr. Lit.*, iii. p. 181.

SIMONIDES OF CEOS (556–469 B.C.), one of the greatest poets and most accomplished men of antiquity, was born at Iulis in the island of Ceos, 556 B.C. Few poetic natures have ever been planted in more congenial soil. His native island was devoted to the worship of Apollo, the god of song; poetry had been cultivated in his family for generations; his youth coincided with the period succeeding the first great burst of Æolian and Doric lyric poetry; his manhood saw the heroic struggle with Persia, when Greece first awoke to the consciousness of her national unity; and he died before the inevitable disintegration had begun. Among his friends were all the foremost men of the day,—kings and princes like Hipparchus and Hiero and the Aleuadæ and Scopadæ, statesmen like Pausanias and Themistocles, and poets like Æschylus, Epicharmus, and his own nephew Bacchylides. Pindar alone among his contemporaries seems to have depreciated Simonides, perhaps not without a touch of jealousy; by all the rest he was revered as the poet laureate of emancipated Greece. He lived for the most part with his friends, whose praises he had sung for money; we hear of him at the court of Hipparchus in Athens, with the Scopadæ in Thessaly, and finally at the court of Hiero of Syracuse, where he died in 469 B.C.

His reputation as a man of learning and ingenuity is shown by the tradition that he added two new letters to the alphabet—η and ω—the truth being probably that he was one of the first authors to use these symbols, before the archonship of Euclides. So unbounded were his popularity and influence that he was felt to be a power even in the political world; we are told that he reconciled Thero and Hiero on the eve of a battle between their opposing armies. For his poems he could command almost any price; later writers, from Aristophanes onwards, accuse him of avarice, probably not without some reason. From the numerous anecdotes preserved about him we see that he was what we should infer from his poems, a genial and courtly man, "dwelling with flowers,—like the bee, seeking yellow honey" (Fr. 47), yet not without a vein of gentle irony. To Hiero's queen, who asked him whether it was better to be born rich or a genius, he replied "Rich, for genius is ever found at the gates of the rich."

Of his poetry we possess two or three short elegies (Fr. 85 seems from its style and versification to belong to Simonides of Amorgos, or at least not to be the work of our poet), several epigrams, and about ninety fragments of lyric poetry. The epigrams, written in the usual dialect of elegy, Ionic with an epic colouring, were intended partly for public and partly for private monuments. There is strength and sublimity in the former, with a simplicity that is almost statuesque, and a complete mastery over the rhythm and forms of elegiac expression. Those on the heroes of Marathon and Thermopylæ are the most celebrated. In the private epigrams there is more warmth of colour and feeling, but here it is hard to decide which are genuine and which spurious; few of them rest on any better authority than that of the Palatine anthology. One interesting and undoubtedly genuine epigram of this class is upon Archedice, the daughter of Hippias the Pisistratid, who, "albeit her father and husband and brother and children were all princes, was not lifted up in soul to pride." The lyric fragments vary much in character and length: one is from a poem on Artemisium, and celebrates those who fell at Thermopylæ; another is an ode in honour of Scopas; the rest represent odes on victors in the games, hyporchemes, dirges, hymns to the gods, and other varieties. The poem on Thermopylæ is reverent and sublime, breathing an exalted patriotism and a lofty national pride; the others are full of tender pathos and deep feeling, such as evoked from Catullus the line "Mæstius lacrimis Simonideis," with a genial worldliness befitting one who had "seen the towns and learnt the mind of many men." For Simonides requires no standard of lofty unswerving rectitude. "It is hard," he says (Fr. 5), "to become a truly good man, perfect as a square in hands and feet and mind, fashioned without blame. Whosoever is bad, and not too wicked, knowing justice, the benefactor of cities, is a sound man. I for one will find no fault with him, for the race of fools is infinite. . . . I praise and love all men who do no sin willingly; but with necessity even the gods do not contend." Virtue, he tells us elsewhere in language that recalls Hesiod, is set on a high and difficult hill (Fr. 58); let us seek after pleasure, for "all things come to one dread Charybdis, both great virtues and wealth" (Fr. 38), and "what life of mortal man, or what dominion, is to be desired apart from pleasure, without which even the gods' existence is not to be envied" (Fr. 71). Yet Simonides is far from being a hedonist; his morality, no less than his art, is pervaded by that virtue for which Ceos was renowned—*σωφροσύνη* or self-restraint. His most celebrated fragment, and one of the most exquisite and touching remains of ancient poetry, is a dirge, in which Danae, adrift with the infant Perseus on the sea in a dark and stormy night, takes comfort from the peaceful slumber of her babe. Simonides here illustrates his own saying that "poetry is vocal painting, as painting is silent poetry" (one of the opening remarks in Lessing's *Laocoon*); from the picture of the sleeping child, standing out as if in relief against the background of surging waves, and Danae in tears, we can well understand how Longinus should have commended this power of vivid presentation as a distinguishing feature in another of Simonides's poems. This poem has been often translated. One of the best translations is that by Symonds, in the first series of his *Studies on the Greek Poets*.

See Bergk, *Poetæ Lyrici Græci*, vol. iii., Leipsic, 1882, pp. 382–535. Welcker was the first who clearly separated the fragments of the Cean Simonides from those of his namesake. Sterling (*Essays and Tales*, vol. i. pp. 188 *sq.*) has a poetical translation of most of them.

SIMONY is an offence against the law of the church. The name is taken from SIMON MAGUS (*q.v.*). In the canon law the word bears a more extended meaning than in English law. "Simony according to the canonists," says Ayliffe in his *Parergon*, "is defined to be a deliberate act or a premeditated will and desire of selling such things as are spiritual, or of anything annexed unto spirituals, by giving something of a temporal nature for the purchase thereof; or in other terms it is defined to be a commutation of a thing spiritual or annexed unto spirituals by giving something that is temporal." An example of the offence occurs as early as the 3d century in the purchase of the bishopric of Carthage by a wealthy matron for her servant, if the note to Gibbon (vol. ii. p. 457) is to be believed. The offence was prohibited by many councils, both in the East and in the West, from the 4th century onwards. In the *Corpus Juris Canonici* the Decretum (pt. ii. cause i. quest. 3) and the Decretals (bk. v. tit. 3) deal with the subject. The offender, whether *simoniacus* (one who had bought his orders) or *simoniace promotus* (one who had bought his promotion), was liable to deprivation of his benefice and deposition from orders if a secular priest,—to confinement in a stricter monastery if a regular. No distinction seems to have been drawn between the sale of an immediate and of a reversionary interest. The innocent *simoniace promotus* was, apart from dispensation, liable to the same penalties as though he were guilty. Certain matters were simoniacal by the canon law which would not be so regarded in English law, *e.g.*, the sale of tithes, the taking of a fee for confession, absolution, marriage, or burial, the concealment of one in mortal sin or the reconcilement of an impenitent for the sake of gain, and the doing homage for spiritualities. So grave was the crime of simony considered that even infamous persons could accuse of it. English provincial and legatine constitutions continually assailed simony. Thus one of the heads in Lyndewode (bk. v.) is, "Ne quis ecclesiam nomine dotalitatis transferat vel pro præsentatione aliquid accipiat." In spite of all the provisions of the canon law it is well established that simony was deeply rooted in the mediæval church. Dante places persons guilty of simony in the third bolgia of the eighth circle of the Inferno:—

"O Simon mago, O miseri seguaci,
Che le cose di Dio che di bontate
Deono esser spose, voi rapaci
Per oro e per argento adulterate."—*Inf.*, xix. 1.

The popes themselves were notorious offenders In the canto just cited Pope Nicholas III is made by the poet the mouthpiece of the simoniacs He is supposed to mistake the poet for Boniface VIII, whose simoniacal practices, as well as those of Clement V, are again alluded to in Par xxx 147 At a later period there was an open and continuous sale of spiritual offices by the Roman curia which contemporary writers attacked in the spirit of Dante A pasquinade against Alexander VI begins with the lines—

> "Vendit Alexander claves, altaria, Christum
> Emerat ille prius, vendere jure potest"

Machiavelli calls luxury, simony, and cruelty the three dear friends and handmaids of the same pope [1] The colloquy of Erasmus *De Sacerdotiis Captandis* bears witness to the same state of things And, best proof of all, numerous decisions as to what is or is not simony are to be found in the reported decisions of the Roman rota [2] That part of the papal revenue which consisted of first-fruits (*primitiæ* or *annates*) and tenths (*decimæ*) must have been theoretically simoniacal in its origin In England this revenue was annexed to the crown by Henry VIII and restored to the church by Queen Anne (see QUEEN ANNE'S BOUNTY)

For the purposes of English law simony is defined by Blackstone as the corrupt presentation of any person to an ecclesiastical benefice for money, gift, or reward The offence is one of purely ecclesiastical cognizance, and not punishable by the criminal law The penalty is forfeiture by the offender of any advantage from the simoniacal transaction, of his patronage by the patron, of his benefice by the presentee An innocent clerk is under no disability, as he might be by the canon law Simony may be committed in three ways,—in promotion to orders, in presentation to a benefice, and in resignation of a benefice The common law (with which the canon law is incorporated, as far as it is not contrary to the common or statute law or the prerogative of the crown) has been considerably modified by statute Where no statute applies to the case, the doctrines of the canon law may still be of authority Both Edward VI and Elizabeth promulgated advertisements against simony The Act of 31 Eliz c 6 was intended to reach the corrupt patron as well as the corrupt clerk, the ecclesiastical censures apart from the statute not extending to the case of a patron The first part of the Act deals with the penalties for election or resignation of officers of churches, colleges, schools, hospitals, halls, and societies for reward The second part of the Act provides that if any person or persons, bodies politic and corporate, for any sum of money, reward, gift, profit, or benefit, directly or indirectly, or for or by reason of any promise, agreement, grant, bond, covenant, or other assurances, of or for any sum of money, &c, directly or indirectly present or collate any person to any benefice with cure of souls, dignity, prebend, or living ecclesiastical, or give or bestow the same for or in respect of any such corrupt cause or consideration, every such presentation, collation, gift, and bestowing, and every admission, institution, investiture, and induction shall be void, frustrate, and of none effect in law, and it shall be lawful for the queen to present, collate unto, or give and bestow every such benefice dignity, prebend, and living ecclesiastical for that one time or turn only, and all and every person or persons, bodies politic and corporate, that shall give or take any such sum of money, &c, directly or indirectly, or that shall take or make any such promise, &c, shall forfeit and lose the double value of one year's profit of every such benefice, &c, and the person so corruptly taking, procuring, seeking, or accepting any such benefice, &c, shall be adjudged a disabled person in law to have or enjoy the same benefice, &c Admission, institution, installation, or induction of any person to a benefice, &c, for any sum of money, &c, renders the offender liable to the penalty already mentioned But in this case the presentation reverts to the patron and not to the crown The penalty for corrupt resigning or exchanging of a benefice with cure of souls is that the giver as well as the taker shall lose double the value of the sum so given or taken, half the sum to go to the crown and half to a common informer The penalty for taking money, &c, to procure ordination or to give orders or licence to preach is a fine of £40, the party so corruptly ordained forfeits £10, acceptance of any benefice within seven years after such corrupt entering into the ministry makes such benefice merely void, and the patron may present as on a vacancy, the penalties are divided as in the last case The Act is cumulative only, and does not take away or restrain any punishment prescribed by ecclesiastical law The Act of 1 Will and M sess 1, c 16, guards the rights of an innocent successor in certain cases It enacts that after the death of a person simoniacally presented the offence or contract of simony shall not be alleged or pleaded to the prejudice of any other patron innocent of simony, or of his clerk by him presented, unless the person simoniac or simoniacally presented was convicted of such offence at common law or in some ecclesiastical court in the lifetime of the person simoniac or simoniacally presented The Act also declares the validity of leases made by a simoniac or simoniacally presented person, if *bona fide* and for valuable consideration to a lessee ignorant of the simony By 13 Anne c 11, if any person shall for money, reward, gift, profit, or advantage, or for any promise, agreement, grant, bond, covenant, or other assurance for any money, &c, take, procure, or accept the next avoidance of or presentation to any benefice, dignity, prebend, or living ecclesiastical, and shall be presented or collated thereupon, such presentation or collation and every admission, institution, investiture, and induction upon the same shall be utterly void, and such agreement shall be deemed a simoniacal contract, and the queen may present for that one turn only, and the person so corruptly taking, &c, shall be adjudged disabled to have and enjoy the same benefice, &c, and shall be subject to any punishment limited by ecclesiastical law 3 and 4 Vict c 113, § 42, provides that no spiritual person may sell or assign any patronage or presentation belonging to him by virtue of any dignity or spiritual office held by him, such sale or assignment is null and void This section has been construed to take away the old archbishop's "option," *i e*, the right to present to a benefice in a newly appointed bishop's patronage at the option of the archbishop By canon 40 of the canons of 1603 an oath against simony was to be administered to every person admitted to any spiritual or ecclesiastical function, dignity, or benefice By 28 and 29 Vict c 122 a declaration was substituted for the oath, and a new canon incorporating the alteration was ratified by the crown in 1866 By the canon law all resignation bonds were simoniacal, and in 1826 the House of Lords held that all resignation bonds, general or special, were illegal Special bonds have since, however, been to a limited extent sanctioned by law 9 Geo IV c 94 makes a written promise to resign valid if made in favour of some particular nominee or one of two nominees, subject to the conditions that, where there are two nominees, each of them must be either by blood or marriage an uncle, son, grandson, brother, nephew, or grand-nephew of the patron, that the writing be deposited with the registrar of the diocese open to public inspection, and that the resignation be followed by presentation within six months of the person for whose benefit the bond is made Cases of simony have come before the courts in which clergy of the highest rank have been implicated In 1695, in the case of Lucy *v* The Bishop of St David's, the bishop was deprived for simony The Queen's Bench refused a prohibition (1 Lord Raymond's Rep 447) As lately as 1841 the dean of York was deprived by the archbishop for simony, but in this case the Queen's Bench granted a prohibition on the ground of informality in the proceedings (In the Matter of the Dean of York, 2 *Queen's Bench Rep*, 1) The general result of the law gathered from the statutes and decisions may be exhibited as follows —(1) it is not simony for a layman or spiritual person not purchasing for himself to purchase while the church is full an advowson or next presentation, however immediate the prospect of a vacancy, (2) it is not simony for a spiritual person to purchase for himself a life or any greater estate in an advowson, and to present himself thereto, (3) it is not simony to exchange benefices under an agreement that no payment is to be made for dilapidations on either side, (4) it is not simony to make certain assignments of patronage under the Church Building and New Parishes Acts (9 and 10 Vict c 88, 32 and 33 Vict c 94), (5) it is simony for any person to purchase the next presentation while the church is vacant, (6) it is simony for a spiritual person to purchase for himself the next presentation, though the church be full, (7) it is simony for any person to purchase the next presentation, or in the case of purchase of an advowson the next presentation by the purchaser will be simoniacal if there is any arrangement for causing a vacancy to be made, (8) it is simony for the purchaser of an advowson while the church is vacant to present on the next presentation, (9) it is simony to exchange otherwise than *simpliciter*, no compensation in money may be made to the person receiving the less valuable benefice The law on the subject of simony has been for some time regarded as unsatisfactory by the authorities of the church The archbishop of Canterbury has undertaken to introduce into the House of Lords a bill for the amendment of the law, the heads of which have recently (February 1886) been under the consideration of convocation The bill proposes *inter alia* to prohibit the sale of next presentations and of advowsons unless under certain limitations, to abolish resignation bonds, and to substitute for the present declaration against simony declarations that the presentee has not committed certain specific acts

[1] See Roscoe, *Life of Leo X*, vol i p 463

[2] Compare the fine distinctions drawn by the casuists and attacked by Pascal in the twelfth of the *Provincial Letters*

In Scotland simony is an offence both by civil and ecclesiastical law. The rules are generally those of the canon law. There are few decisions of Scottish courts on the subject. By the Act of 1584, c. 5, ministers, readers, and others guilty of simony provided to benefices were to be deprived. An Act of Assembly of 1753 declares pactions simoniacal whereby a minister or probationer before presentation and as a means of obtaining it bargains not to raise a process of augmentation of stipend or demand reparation or enlargement of his manse or glebe after induction. (J. W†.)

SIMPLICIUS, the successor of Pope Hilarius or Hilarus, was a native of Tibur, and was consecrated bishop of Rome on February 25, 468. He died March 2, 483, and was succeeded by Felix III. His extant letters, which date from the banishment of Romulus Augustulus and the early years of Odoacer's reign, relate almost entirely to the ecclesiastical and court intrigues of Alexandria and Constantinople in connexion with the Monophysite controversy.

SIMPLICIUS, a native of Cilicia, a disciple of Ammonius and of Damascius, was one of the last of the Neoplatonists. From 400 to 529 A.D. the Neoplatonic school at Athens was the centre of pagan opposition to victorious Christianity, and, as such, fell a victim to imperial persecution. The subvention which it had received from the state was withdrawn, its private property was confiscated, and at last in 529 the teaching at Athens of philosophy and jurisprudence was forbidden (Malalas, p. 451, ed. Bonn). Disestablished, disendowed, and silenced, the scholarch Damascius, Simplicius, Priscianus, and four others resolved in 531 or 532 to seek the protection of Khosrau Anósharván (or Chosroes), who had ascended the throne of Persia in the former of these years. To his court they went, but, though from this patron of Greek learning they received a hearty welcome, they found themselves unable to support a continued residence amongst barbarians. Before two years had elapsed they returned to Greece, Khosrau, in his treaty of peace concluded with Justinian in 533, expressly stipulating that the seven philosophers should be allowed "to return to their own homes, and to live henceforward in the enjoyment of liberty of conscience" (Agathias, ii. 30, 31). After his return from Persia Simplicius wrote commentaries upon Aristotle's *De Cœlo*, *Physica*, *De Anima*, and *Categoriæ*, which, with a commentary upon the *Enchiridion* of Epictetus, have survived. In his writings Simplicius, who had small pretensions to originality of doctrine, devotes himself to the exposition and reconciliation of his authorities. His respect at once for Plato and for Aristotle is so great that he refuses to acknowledge any real difference between them, even in regard to their theories of universals and of matter. His remarks are, however, thoughtful and intelligent, and his learning is prodigious. To the student of Greek philosophy his commentaries are invaluable, as they contain many fragments of the older philosophers as well as of his immediate predecessors.

The editions of the Greek text of the commentaries are as follows:—on the *De Cœlo*, Utrecht, by S. Karsten, 1865 (the Greek text published at Venice in 1526 is no more than a retranslation from Guil. de Moerbeka's Latin version); on the *Physica*, Venice, 1526, Berlin (by H. Diels), vol. i. 1882; on the *De Anima* (a disappointing work), Venice, 1527, Berlin (by M. Hayduck), 1882; on the *Categoriæ*, Venice, 1499, Basel, 1551; on the *Enchiridion*, Venice, 1528, Paris (Didot), 1842, &c. On the life and writings of Simplicius, see J. A. Fabricius, *Bibliotheca Græca*, ix. 529 *sq.*; Ch. A. Brandis's excellent article in Smith's *Dict. of Greek and Roman Biography*; E. Zeller, *D. Phil. d. Gr.*, III. ii. 851 *sq.*; also Ch. A. Brandis, "Ueber d. Griech. Ausleger d. Aristot. Organons," in *Abh. Berl. Akad.*, 1833, and C. G. Zumpt, "Ueber d. Bestand d. phil. Schulen in Athen," *ibid.*, 1842.

SIMPSON, SIR JAMES YOUNG, BART. (1811–1870), physician, was born in the town of Bathgate, Linlithgow, Scotland, on the 7th of June 1811. His father was a baker in that town, who largely owed a moderate success in business to a shrewd and managing wife. James was the youngest of a family of eight, and for the furtherance of his worldly prospects the others struggled and sacrificed. At the age of fourteen he entered the university of Edinburgh as a student in the arts classes. Two years later he began his medical studies. At the age of nineteen he obtained the licence of the College of Surgeons, and two years afterwards took the degree of doctor of medicine. Dr Thomson, who then occupied the chair of pathology in the university, impressed with the graduation thesis, "On Death from Inflammation," presented by Simpson, offered him his assistantship. The offer was accepted, and during the session 1837–38 he acted as interim lecturer on pathology during the illness of the professor. The following winter he delivered his first course of lectures on obstetric medicine in the extra academical school. On February 4, 1840, he was elected to the professorship of medicine and midwifery in the university. Towards the end of 1846 he was present at an operation performed by Liston on a patient rendered unconscious by the inhalation of sulphuric ether. The success of the proceeding was so marked that Simpson immediately began to use it in midwifery practice. He continued, however, to search for other substances having similar effects, and in March 1847 he read a paper on chloroform to the Medico-Chirurgical Society of Edinburgh, in which he fully detailed the history of the use of anæsthetics from the earliest times, but especially dwelt upon the advantages of chloroform over ether. He advocated its use, not only for the prevention of pain in surgical operations, but also for the relief of pain in obstetrical practice. His strong and uncompromising advocacy of its use in the latter class of cases gave rise to one of the angriest and most widespread controversies of the time, and, although his views may not have been generally indorsed by later professional practice, anæsthetics in surgical operations have from that time held an indisputed place, and Simpson's anæsthetic still continues the favourite in the practice of the Edinburgh school. In 1847 he was appointed a physician to the queen in Scotland. In 1859 he advocated the use of acupressure in place of ligatures for arresting bleeding; his views on this subject have, however, given place to improvements in the ligature and to a better knowledge of the conditions influencing its efficiency. His contributions to the literature of his profession and to archæology, in which latter he took an active interest, were very numerous, and embrace *Obstetric Memoirs and Contributions* (2 vols.), *Homœopathy*, *Acupressure*, *Selected Obstetrical Works*, *Anæsthesia and Hospitalism*, *Clinical Lectures on the Diseases of Women*, and three volumes of essays on archæological subjects. Simpson, who had been created a baronet in 1866, died on May 6th 1870, and was accorded a public funeral; his statue in bronze now stands in West Princes Street Gardens, Edinburgh.

Simpson was a man of strong individuality and somewhat hasty temper, an uncompromising and aggressive opponent when he believed himself in the right, yet so tender and sympathetic that he endeared himself to an immense circle of friends and patients. Endowed with great mental power, activity, and receptivity, he performed a very large amount of literary work, much of which was of great value at the time and still continues to be of interest. He will, however, be chiefly remembered in the annals of medicine as a great personality, who brilliantly fought and won the battle for anæsthetics, and introduced chloroform.

SIMPSON, THOMAS (1710–1761), mathematician, was born at Market Bosworth in Leicestershire on the 20th of August 1710. His father was a stuff weaver, and, intending to bring his son up to his own business, took little care of the boy's education. Young Simpson, however, was eager for knowledge, and so ardent was he in pursuit of it that he neglected his weaving, and in consequence of a quarrel was forced to leave his father's house. He settled

for a short time at Nuneaton, where he met a pedlar who practised fortune-telling. By the encouragement and assistance of this man Simpson was induced to make a profession of casting nativities himself, and he soon became the oracle of the neighbourhood. But he was not long in discovering the imposture of astrology, and his conscience, as well as an accident which happened to him in the practice of his art, compelled him to abandon this profession. After a residence of two or three years at Derby, where he worked as a weaver during the day and taught pupils in the evenings, he went up to London and pursued the same course, but with more success. The number of his pupils increased; his abilities became more widely known; and he was enabled to publish by subscription his *Treatise of Fluxions* in 1737. His treatise, as was afterwards acknowledged, abounded with errors of the press, and contained several obscurities and defects incidental to the author's want of experience and the disadvantages under which he laboured. His next publications were *A Treatise on the Nature and Laws of Chance*, 1740; *Essays on Several Curious and Useful Subjects in Speculative and Mixed Mathematicks*, 1740; *The Doctrine of Annuities and Reversions deduced from General and Evident Principles*, 1742; and *Mathematical Dissertations on a Variety of Physical and Analytical Subjects*, 1743. Soon after the publication of his *Essays* he was chosen a member of the Royal Academy at Stockholm; in 1743 he was appointed professor of mathematics in the Royal Military Academy at Woolwich; and in 1745 he was admitted a fellow of the Royal Society of London. In 1745 he published *A Treatise of Algebra*, with an appendix containing the construction of geometrical problems, and in 1747 the *Elements of Plane Geometry*. The latter book, unlike many others with the same title, is not an edition of Euclid's *Elements*, but an independent treatise. Though it can hardly be said that as an introduction to geometry it is preferable to Euclid, yet the solutions of problems contained in it (and in the appendix to the *Algebra* as well) are in general exceedingly ingenious. In his *Trigonometry, Plane and Spherical, with the Construction and Application of Logarithms*, which appeared in 1748, there is a tolerably uniform use of contractions for the words sine, tangent, &c., prefixed to the symbol of the angle. *The Doctrine and Application of Fluxions*, which he issued in 1750, was more full and comprehensive than his earlier work on the same subject, and altogether was so different that he wished it to be considered as a new book and not as a second edition of the former. In 1752 appeared *Select Exercises for Young Proficients in the Mathematicks*, and in 1757 his *Miscellaneous Tracts on Some Curious and Very Interesting Subjects in Mechanics, Physical Astronomy, and Speculative Mathematics*, the last and perhaps the greatest of all his works. From the year 1735 he had sometimes under his own name, sometimes under fictitious names, been a frequent contributor to the *Ladies' Diary*, an annual publication partly devoted to the solution of mathematical problems, and from 1754 till 1760 inclusive he was the editor of it. From first to last Simpson seems to have had his own share of the cares and anxieties of this world, and it is astonishing how under such circumstances he contrived to accomplish what he did. His unremitting application and the want of proper regimen gradually undermined his health, and he died on the 14th of May 1761 at his native village. His name will probably be considered the most illustrious in the long roll of the non-academical mathematicians of Britain.

SIMROCK, Karl (1802–1876), German poet and student of mediæval literature, was born on the 28th August 1802 at Bonn, where his father was a musicseller. He studied law at the universities of Bonn and Berlin, and in 1823 entered the Prussian civil service, from which he was expelled in 1830 for having written a poem in praise of the July revolution. Afterwards he was permitted to lecture at the university of Bonn, and in 1850 he was made a professor of Old German literature. He died on the 18th July 1876.

Simrock established his reputation by his excellent modern rendering of the *Nibelungenlied* (1827), and of the works of Walther von der Vogelweide (1833). Among other works translated by him into the German of to-day were the *Arme Heinrich* of Hartmann von Aue (1830), the *Parzival* and *Titurel* of Wolfram von Eschenbach (1842), the *Tristan* of Gottfried of Strasburg (1852), the *Edda*, *Beowulf*, and *Heliand*. In the *Heldenbuch* (1843–49) he offered a complete representation of the heroic legends of Germany, partly by means of translations, partly by means of independent poems. Before the publication of this work he had given evidence of an original poetical faculty in *Wieland der Schmied* (1835); and in 1844 he issued a volume of *Gedichte* in which there are many good lyrics, romances, and ballads. In 1850 appeared *Lauda Sion*, and in 1857 the *Deutsche Sionsharfe*, collections of Old German sacred poetry. Of his republications the most popular and the most valuable were the *Deutschen Volksbücher*, of which fifty-five were printed between 1839 and 1867. His best contribution to antiquarian science was his *Handbuch der deutschen Mythologie* (1853–55). At an early stage of his career Simrock took a high place among students of Shakespeare by his *Quellen des Shakespeare in Novellen, Märchen, und Sagen* (1831), and afterwards he translated Shakespeare's poems and a considerable number of his dramas. Another important book was *Novellenschatz der Italiener* (1832). Among the rest of his works may be mentioned *Die Rheinsagen*, *Das malerische und romantische Rheinland*, and his *Deutschen Kriegslieder*.

See Hocker, *Karl Simrock* (1877).

SIMSON, Robert (1687–1768), mathematician, was the eldest son of a Glasgow merchant, John Simson of Kirktonhill in Ayrshire, and was born on the 14th of October 1687. He was intended for the church, and passed with distinction through the usual course of study for that profession at the university of Glasgow. The bent of his mind, however, was towards mathematics, not theology; and, when a prospect was opened up to him of succeeding to the mathematical chair, he proceeded to London in order to become acquainted with some of the eminent mathematicians there and to increase his stock of mathematical knowledge. After a year's residence in London he returned to Glasgow, and in 1711 was appointed by the university to the professorship of mathematics. The duties of this office he discharged for half a century. During that time he published several works on pure geometry, and carried on an extensive mathematical correspondence. In 1746 the university of St Andrews, wishing to confer on him an honorary degree, chose, according to his biographer Dr William Trail, that of doctor of medicine, because in his youth he had made a careful study of botany. He never married, and his long life was spent within the walls of his college. His habits were exceedingly regular, his hours of work and of amusement being rigorously fixed. A studious man of science, he had no relish for the promiscuous intercourse of society, and his manner of living was simple and inexpensive. In person he was tall, with a handsome countenance and an affable manner, and he used always to dress in light-coloured clothes. Though, like some other distinguished mathematicians, he was rather absent-minded, in matters of business he was very circumspect. He was a man of the strictest integrity, ready to do justice to the merits of others, and not too sensible of his own. He enjoyed a long course of uninterrupted health, and was seriously indisposed only for a few weeks before his death, which took place on the 1st of October 1768.

The first of Simson's published writings is a paper in the *Philosophical Transactions* of the Royal Society of London (vol. xl. p. 330, 1723) on the subject of Euclid's *Porisms*, the nature of which he was the first to elucidate (see Porisms). Then followed *Sectionum Conicarum Libri V.* (Edinburgh, 1735), a second edition

of which, with additions, appeared in 1750 The first three books of this treatise were translated into English, and several times printed, with the title *The Elements of the Conic Sections* In 1749 was published *Apollonii Pergæi Locorum Planorum Libri II*, a restoration of one of Apollonius's lost treatises, founded on the lemmas given in the seventh book of Pappus's *Mathematical Collection* In 1756 appeared, both in Latin and in English, the first edition of his Euclid's *Elements* This work, which contained only the first six and the eleventh and twelfth books, and to which in its English version he added the *Data* in 1762, has become the standard text of Euclid in England The additions and alterations which Simson made by way of restoring the text to its "original accuracy" are certainly not all of them improvements, and the notes he appended show with what an uncritical reverence he regarded the great geometers of antiquity. Two other works, restorations of Apollonius's treatise *De Sectione Determinata* and Euclid's treatise *De Porismatibus*, which Simson was too distrustful of himself to publish during his lifetime, were printed for private circulation in 1776 at the expense of Earl Stanhope, in a volume with the title *Roberti Simson, M D Opera Quædam Reliqua* The volume contains also two additional books *De Sectione Determinata*, two small dissertations on *Logarithms* and on the *Limits of Quantities and Ratios*, and a few problems illustrative of the ancient geometrical analysis How far these restorations represent the lost originals will probably always be a matter of conjecture The *De Porismatibus* certainly cannot be coextensive with Euclid's three books, but, if it is only a restored fragment, the credit due to Simson's perseverance and penetration in recovering from oblivion the nature and some of the contents of one of the most interesting treatises of antiquity will always be such as to keep his name in the remembrance of geometers

SIMSON, WILLIAM (1800–1847), portrait, landscape, and subject painter, was born at Dundee in 1800 He studied under Andrew Wilson at the Trustees' Academy, Edinburgh, and his early pictures—landscape and marine subjects—were executed with great spirit and found a ready sale He next turned his attention to figure painting, producing in 1829 the Twelfth of August, which was followed in 1830 by Sportsmen Regaling and a Highland Deerstalker. In the latter year he was elected a member of the Scottish Academy, and, having acquired some means by portrait-painting, he spent three years in Italy, and on his return in 1838 settled in London, where he exhibited his Camaldolese Monk Showing Relics, his Cimabue and Giotto, his Dutch Family, and his Columbus and his Child at the Convent of Santa Maria la Rabida He died in London on the 29th of August 1847

Simson is greatest as a landscapist, his Solway Moss—Sunset, exhibited in the Royal Scottish Academy of 1831 and now in the National Gallery, Edinburgh, ranks as one of the finest examples of the early Scottish school of landscape

His elder brother George (1791–1862), portrait painter, was also a member of the Royal Scottish Academy, and his younger brother David (d 1874) practised as a landscape-painter

SINAI In judging of the points of controversy connected with Sinai we are brought face to face with the question of the historicity of the Hebrew records involved Though new attempts to fix the stations of the wilderness wandering appear every year, critics have long agreed that the number of forty for the years of wandering and for the stations are round numbers, and that the details are not based on historical tradition of the Mosaic age This does not exclude the possibility that the names of some or all of the stations belong to real places and are based on more or less careful research on the part of the writers who record them As regards the Mountain of the Law in particular, if the record of Exod xix *sq* is strictly historical, we must seek a locality where 600,000 fighting men, or some two million souls in all, could encamp and remain for some time, finding pasture and drink for their cattle, and where there was a mountain (with a wilderness at its foot) rising so sharply that its base could be fenced in, while yet it was easily ascended, and its summit could be seen by a great multitude below In the valley there must have been a flowing stream The peninsula of Sinai does not furnish any locality where so great a host could meet under the conditions specified, and accordingly many investigators give up the statistics of the number of Hebrews and seek a place that fulfils the other conditions But when we consider that the various records embodied in the PENTATEUCH (*q v*) were composed long after the time of Moses, and that the authors in all probability never saw Sinai, and had no exact topographical tradition to fall back on, but could picture to themselves the scene of the events they recorded only by the aid of imagination, the topographical method of identifying the Mountain of the Law becomes very questionable The Pentateuchal writers are not at one even about the name of the mountain It used to be thought that Horeb was the name of the mountain mass as a whole, or of its southern part, while Sinai was the Mountain of the Law proper, but it has been shown by Dillmann that the Elohist and Deuteronomy always use the name Horeb for the same mountain which the Jahvist and the Priestly Code call Sinai The Elohist belonged to Northern Israel, but Judges v 5 shows that even in Northern Israel the other name Sinai was not unknown And it might be shown, though that cannot be done here, that the several accounts vary not only as regards the name but in topographical details Thus all that can be taken as historically fixed is that after leaving Goshen the Hebrews abode for some time near a mountain called Sinai or Horeb (*cf* ISRAEL, vol xiii p 396), and that this mountain or range was held to be holy as a seat of the Deity (Exod. ii 1, 1 Kings xix)

Where, then, was this mountain? The Midianites, of whom according to one source Jethro was priest, probably always lived east of the Gulf of 'Akaba, yet we can hardly follow Beke in seeking Sinai beyond that gulf, but must rather think of some point in the so called peninsula of Sinai, which lies between the Gulfs of 'Akaba and Suez, bounded on the N by the Wilderness el-Tîh, which slopes gently towards the Mediterranean To the south of this wilderness rises the Jebel el-Tîh, a mass composed mainly of Nubian sandstone and cretaceous limestone, which attains in fantastic forms an altitude of some 3000 feet; its ridges converge towards the south and are cut off by great valleys from the mass now known as Mount Sinai The latter is composed of primitive rocks,—granite, porphyry, diorite, gneiss, &c The sandstones of Jebel el-Tîh are rich in minerals, inscriptions of Amenophis III and Thothmes III found on the spot show that the ancient Egyptians got emerald, malachite, and kupfergrun at Sarbût al-Khâdem, and still older are the turquoise and copper mines of Maghâra, where inscriptions occur bearing the names of kings from Senefru and Cheops down to Rameses II These mines were worked by criminals and prisoners of war, and the waste products of copper foundries indicate that the peninsula was once better wooded than now, of which indeed we have express testimony of post-Christian date At present the dominant feature is bare walls of rock, especially in the primitive formations, the steep and jagged summits have a striking effect, which is increased by the various colours of the rock and the clearness of the atmosphere. The deep-cut valleys are filled by rushing torrents after rain, but soon dry up again In the south the centre of the main mountain mass is Mount Catherine (8540 feet), Omm Shômar to the south-east being little lower, this peak and north of it Mount Serbâl (6750 feet), which rises more immediately from the plain, dominate the Kâ'ah, a waste expanse of sand strown with pebbles, which occupies the south-west margin of the peninsula In the Kâ'ah is the village of Tûr, and at the southern promontory (Ras Mohammed) is the little hamlet of Sherm The Sinai group as a whole is called by the Arabs Jebel al-Tûr, the name Sînâ in Arabic comes only from books. The area

of the peninsula is about 11,200 square miles, the population is four to five thousand souls, chiefly Bedouins of various tribes, whose common name, derived from Túr, is Towara They have sheep and goats, with which they retire in summer to the higher lands, where there is good pasture ground, and where springs are comparatively common On the chalk and sandstone water is scarcer than among the primitive rocks, and often brackish Though the rocks are bare, there is always vegetation in the dales, especially acacias and tamarisks, from the latter (*T mannifera*) manna is still derived in quantities that vary with the rainfall On the hills grow aromatic plants, especially *Thymaceæ* The fauna includes the ibex, hyrax, and hyæna, the panther too is sometimes found Flights of quail have been observed In some valleys there are well-kept gardens and good date-palms, the most noted oasis is that of Feiran, in the north-west of the peninsula, which is watered by a perennial stream Whether Feiran is the Rephidim of Exod xvii is a question which, like the identification of the other stations of the Israelites, depends on the localization of the Mountain of the Law

There is no genuine pre-Christian tradition on this subject The chief authority for the ancient sanctity of Mount Sinai is Antoninus Martyr (end of the 6th century), who tells that the heathen Arabs in his time still celebrated a moon feast there As *sîn* means "moon," this feast has been connected with the name of Sinai, but the proposed etymology is not certain Of heathen origin, too, are the many Nabatæan inscriptions (see NABATÆANS) of Sinai, found especially in the Wády Mokatteb (in the north-west), and sometimes accompanied by rude drawings The language and character are Aramaic, but the proper names are mainly those of Arabs, who passing by graved their names on the rocks That they were pilgrims to Sinai cannot be made out with certainty The inscriptions date from the early years of the Christian era, when the Nabatæan kingdom was at its height

In early Christian times many anchorites inhabited Sinai, living for the most part in the caves, which are numerous even in the primitive rocks Then monasteries were built, the most famous being the great one of St Catherine in Wády el-Dér (the valley of the monastery) On Serbál, too, there were many granite dwellings, and in the neighbouring Pharan (Phœnicion), which was a bishop's see, there were, as the ruins show, churches and convents

The question then is whether when the hermits first settled in the peninsula there existed a tradition as to the place of the Mountain of the Law, and whether they chose for their residence a spot which was already traditionally consecrated by memories significant to the Christian as well as to the Jew No assertion of the existence of such a tradition is to be found in Josephus, who only says that Sinai was the highest mountain of the district—a description which might apply to Serbál as seen from the plain below Eusebius uses expressions which may also seem to point to Serbál as the place of the law-giving, and it must be admitted that the tradition which seeks the holy site in the group of Jebel Músá (*i e*, the mass of which Mount Catherine is the highest peak) is not older than the time of Justinian, so that the identification with Mount Serbál seems to have greater antiquity in its favour In later times Jebel Músá and Serbál had each its own tradition, and the holy places were pointed out at each, thus from the monastery of St Catherine a path of granite steps was constructed up to "the Mountain of the Law," but similar steps are found at Serbál That these traditions are not decisive, however, is admitted, more or less, even by those moderns who, like Lepsius, Ebers, Bartlett, give their voice for Serbál Most authorities still prefer Jebel Músá or some point in that group, but they again differ in details First of all there is much difficulty in determining the route by which the Hebrews approached the mountain Then comes the question of finding a suitable plain for their encampment under the mountain, which is best met if, with Robinson, Stanley, Palmer, and others, the plain is taken to be that of al-Ráhe and the overhanging mountain to be Jebel Sufsafeh The latter is over 6300 feet high, and consists of pasture ground, it does not fit all the details in Exodus, but this objection is quite as strong against the traditional site on Jebel Músá (Mount Moses), which lies farther to the south Jebel Músá has been accepted by Tischendorf, Laborde, Ritter, Strauss, Farrar, and many others, on this view the Israelites must have encamped in the narrow Wády al-Seba'iyeh, north of the mount But the absence of exact topographical detail on the part of the Biblical narrators, who always speak of Sinai as if it were a single summit and give no hint about several summits of which it is one, shows that in their time there was no real tradition on the matter, and that all attempts at identification are necessarily vain

SINCLAIR, SIR JOHN, BART (1754–1835), a voluminous Scottish author, was descended from the Sinclairs of Ulbster, a branch of the noble house of Caithness. He was the eldest son of George Sinclair and Janet, daughter of William, Lord Strathnaver, and was born at Thurso Castle, 10th May 1754 For a short time he had Logan the poet as a private tutor, and, after studying Greek and Latin at the high school of Edinburgh, entered the university in his thirteenth year He was admitted a member of the faculty of advocates in 1775, and was subsequently called to the English bar (Lincoln's Inn), but, preferring politics to law, was in 1780 elected member of parliament for his native county As Caithness was then only alternately represented with Bute, he was in 1784 chosen for Lostwithiel, Cornwall, and in 1796 for Petersfield, Hampshire, his parliamentary career extending almost uninterruptedly over thirty years till July 1811 In 1782 he began the issue of those pamphlets on various subjects connected with the welfare of the nation which made him perhaps the most voluminous author of his time, his separate publications, as given in his *Memoirs*, amounting in all to three hundred and sixty-seven His reputation as a financier and political economist was firmly established by his publication in 1784 of the *History of the Public Revenue of the British Empire*, to subsequent editions of which was added a *Review of the Financial Administration of the Right Hon William Pitt* The adoption of his plan for the issue of exchequer bills during the great commercial stagnation of 1793 prevented the ruin of a large number of merchants and manufacturers, and in 1797 Pitt consulted him when the treasury threatened to become exhausted, with the result that the scheme known as the "loyalty loan" was established On 4th February 1786 Sinclair was created a baronet of Great Britain After succeeding his father in 1770 he had set himself to improve the family estates, thus changing in a great degree the aspect of Caithness and affording employment to a largely increased number of the population. In 1791 he established at Edinburgh a society

for the improvement of breeds of sheep, and in 1793 he circulated a plan for a board of agriculture and internal improvement When the board was shortly afterwards established by a charter from the crown he was nominated its first president From the agricultural reports published by this society he compiled his *Code of Agriculture*, published in 1819 About 1790 he conceived a plan for a *Statistical Account of Scotland*, and the work was published in twenty-one volumes, 1791–1799

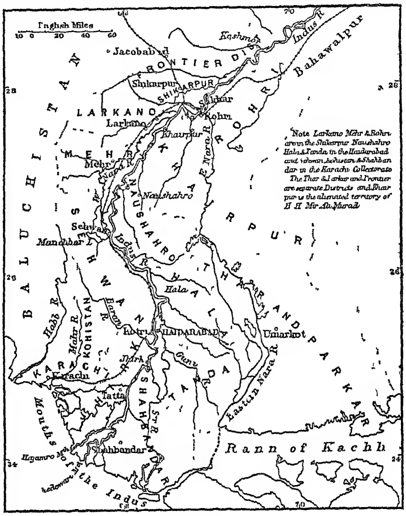
Sir John Sinclair was also the author of a number of tracts on naval and military subjects, and in 1794 he raised for the defence of the kingdom a regiment of a thousand men, at first called the "Caithness Fencibles," afterwards the "Rothesay and Caithness Fencibles", a second battalion of a thousand men was raised by him in 1795, which took part in suppressing the rebellion in Ireland in 1798 Though originally a supporter in parliament of the war policy of Pitt, he afterwards joined the "armed neutrality" party, which advocated retrenchment and reform In 1805 he was appointed by Pitt a commissioner for superintending the construction of roads and bridges in the north of Scotland He was a member of most of the agricultural societies of the Continent, and held as many as twenty-five foreign diplomas He was a fellow of the Royal Societies of London and Edinburgh, a fellow of the Antiquarian Society of London, and president of the Highland Society of London No man of his time took a more comprehensive and enlightened interest in the general welfare of the country or conferred on it more substantial benefits He enjoyed the esteem and intimate friendship of many eminent contemporaries both at home and abroad, with several of whom he kept up an extensive correspondence He died 21st December 1835

By his first wife, a daughter of Alexander Maitland of Stoke Newington near London, he had two daughters, of whom the elder, Hannah, was the authoress of a work on the *Principles of the Christian Faith* By his second wife, the Hon Diana Macdonald, only daughter of Alexander, first Lord Macdonald, he had thirteen children, of whom the eldest son, George (1790–1860), who succeeded to the baronetcy, was a schoolfellow of Byron and Peel at Harrow, and is styled by Byron the "prodigy of our school days", the third son, John (1797–1875), became archdeacon of Middlesex, and, besides the *Memoirs* of his father, wrote several theological works, and the fourth daughter, Catherine (1800–1864), who for many years acted as his secretary, after his death achieved some distinction as an authoress, her principal works being *Modern Accomplishments*, 1836, *Scotland and the Scotch*, 1840, *Modern Flirtation*, 1841, and *Popular Legends and Bible Truths*, 1852

See *Correspondence of the Right Hon Sir John Sinclair, Bart, with Reminiscences of Distinguished Characters*, 2 vols, London, 1831, and *Memoirs of the Life and Works of the Right Hon Sir John Sinclair*, 2 vols, Edinburgh, 1837

SIND, the westernmost territorial subdivision of India, and a frontier province of considerable importance in a geographical and political aspect, lies between the 23d and 28th parallels of N latitude and between the 66th and 71st meridians of E longitude Its length from north to south is estimated at 360 miles, and the average of its breadth from east to west at 170 On the north it is bounded by the Khelat state (see BALUCHISTAN), the Punjab, and Baháwalpúr, on the E by Jaisalmir and Mulani, or generally the more desert tracts of Western Rajputana, on the S. by the Runn of Cutch (Rann of Kachh) and the Indian Ocean, and on the W. by Khelat, which overlaps it on the north Including the alienated district of Khairpur and the extensive tract to the south called the political superintendency of the Thar and Parkar, its area is set down as between 56,000 and 57,000 square miles

The one great geographical feature in Sind is the lower Indus, passing, as it does, through the entire length of the province, first in a south-westerly direction, then turning somewhat to the east, then returning to a line more directly south, and finally inclining to the west, to seek an outlet at the sea Though there is much similarity in the appearance of the landscape on the two sides of the broad river, the distant line of mountains between Sakhar and Sehwan, the steep pass overhanging the water at Lakki, and the hill country below Sehwan give a distinctive character to the right bank, and lend it special attraction when contrasted with the flat lowlands, merging into desert, on the left Sind has been aptly likened to Egypt If the one depends for life and fertility on the Nile, so does the other on the Indus The cities and towns are not so readily to be compared Hyderabad, notwithstanding its remarkable fortress and handsome tombs, can



Map of Sind

scarcely vie in interest as a native capital with Cairo, nor can Kurrachee, as a Europeanized capital, be said to have attained the celebrity of Alexandria Yet there are some respects in which this particular province would not be wholly eclipsed, even in its outside pictures It contains many monuments of archæological and architectural interest, and to the traveller descending the river from the Punjab, or ascending it from Kotri, the *coup d'œil* on the approach to Rohri is at times singularly striking The beautiful little island of Khwája Kidhr is a gem in itself, and there is at certain seasons undoubted poetry in the very dreariness of Sakhar and Bakhar

Owing to the deficiency of rain, the continuance of hot weather in Sind is exceptional Lying between two monsoons, it just escapes the influence of both The south-west monsoon stops short at Lakhpat Bandar, the north-west monsoon at Kurrachee, and even here the annual rainfall is not reckoned at more than six or eight inches At times there is no rainfall for two or three years, while at others there is a whole season's rainfall in one or two days. The average temperature of the summer months rises to 95° F, and the winter average is 60°, the summer maximum being 120° and the winter minimum 32° The temperature on the sea coast is much more equable than elsewhere. In Northern Sind we find frost in winter, while both there and in Lower Sind the summer heat is extreme and prolonged This great heat, combined with the poisonous exhalations from the pools left after the annual inundation and the decaying vegetable deposits, produces the fever and ague with which the name of the country is associated, and to which even the natives themselves fall a prey

Soil and cultivation. The soil is largely dependent on the river overflow. This grand provision of nature is, however, uncertainly exercised; and not only is the actual volume of water supplied from the upper Indus liable to fluctuation, but the particular lands inundated or untouched by inundation vary according to the caprices of the river. Questions of alluvion and diluvion are therefore of frequent occurrence; and it is often as hard to say whether newly thrown up lands belong to the state or an individual proprietor as it is to decide who is the loser in the case of lands newly submerged. In the lands which, as a rule, are reached annually and in fair proportion by the inundation, the soil is so rich as to produce two crops or even more in the year without the assistance of manure. Salt is present in great quantity. The two principal yearly crops are the vernal, known as *rabi*, sown in autumn and reaped in spring, and the autumnal, known as *kharif*, sown in summer while the river is high and reaped from October to December. In some districts there is a distinct third crop called *peshras*, sown in March and reaped in July and August. The implements of husbandry are the plough (*har*), drawn by two bullocks, the harrow (*sahar*), a heavy log of wood drawn by four bullocks, a man standing on each end; the seed sower (*nari*), a tube fixed to the plough with a wooden funnel on the top, used while the ground is being ploughed for the last time; a curved hook (*datro*) with teeth like a saw, for reaping; and a hoe (*kurrah*), for weeding.

Products. The principal products are *bajri* (a well known Indian grain), and *juari* (the Indian millet), rice, cotton, sugar cane, tobacco, oil seeds, wheat, barley, and indigo. Of these, wheat may be considered the staple produce of Upper, and *bajri* and *juari* of Middle and Lower Sind. Dates, plantains, mangoes, limes, oranges, pomegranates, citrons, figs, grapes, apples, tamarinds, mulberries, and melons are said to be fruits common to the country; and it is added that of late years nectarines, peaches, apricots, and other fruit trees have been successfully introduced, but the statement must be received with some reservation in respect of quantity and quality. There is no doubt that the fruits imported by the Afghan traders find more favour than any home products.

Manufactures. Among the chief manufactures may be mentioned the gold, silver, and silk embroideries, carpets, cloths, lacquered ware, horse trappings and other leather-work, paper, pottery, tiles, swords, and matchlocks, and the boxes and other articles of inlaid work introduced more than a century ago from Shiráz. The lac work, a widely extended industry in India, is also in vogue in Sind. Variously coloured lac is laid in succession on the boxes, &c., while turning on the lathe, and the design is then cut through the different colours. Hyderabad has long been famous for its silks and cottons, silver and gold work, and lacquered ornaments, and the district could once boast of skilled workmen in arms and armour; but, unless the demand for the products of its industries increase, it is to be feared that its old reputation will not long be maintained. In the cloths called *sufi*, silk is woven with the striped cotton—a practice possibly due to the large Mohammedan population of the country, as no Moslem can wear a garment of pure silk without infraction of the law. As regards the carpets, Sir George Birdwood states that those from Sind are the cheapest, coarsest, and least durable of all made in India. Formerly they were fine in design and colouring, but of late years they have greatly deteriorated. The cheap rugs, which sell for about 9s. each, are made with the pile (if not altogether) of cow hair, woven upon a common cotton foundation, with a rough hempen shoot. The patterns are bold and suited to the material, and the dyes good and harmonious.

Fauna. In 1837 the zoology of Sind was reported by Burnes to comprise of genera and species 20 mammals, 191 birds, 86 fishes, 11 reptiles, besides 200 in other departments of natural history. Of wild animals we find the tiger (in the jungles of Upper Sind), the hyæna, the *gurkhar* or wild ass (in the south part of the Thar and Parkar district), the wolf, jackal, fox, wild hog, antelope, *pharho* or hog deer, hares, and porcupines. Of birds of prey, the vulture and several varieties of falcon may be mentioned. The flamingo, pelican, stork, crane, and Egyptian ibis frequent the shores of the delta. Besides these there are the *ubára* (bustard) or *tilur*, the rock-grouse, quail, partridge, and various kinds of parrots. Waterfowl are plentiful; in the cold season the lakes or *dhandhs* are covered with wild geese, *kulang*, ducks, teal, curlew, and snipe. Among other animals to be noted are scorpions, lizards, centipedes, and many snakes.

The domestic animals include camels (one humped), buffaloes, sheep and goats, horses and asses (small but hardy), mules, and bullocks. Of fish there are, on the sea coast, sharks, saw-fish, rays, and skate; cod, *sir*, *cavalho*, red snapper, *gassir*, *begti*, *dangára*, and *buru* abound. A kind of sardine also frequents the coast. In the Indus, the finest flavoured and most plentiful fish is the *palo*, generally identified with the *hilsa* fish of the Ganges. *Dambhro* (*Labeo rohita*) and mullet, *moráko* (*Cirrhina mrigala*), *gandan* (*Notopterus kapirat*), *khago* or catfish (*Rita buchanani*), *popri* (*Barbus sarana*), *shakur*, *jerkho*, and *singhári* (*Macrones aor*) are also found. Otter, turtle, and porpoise are frequently met with; so too are long snouted alligators and water snakes.

Forests. The extent of forest land is relatively small. The forests (about eighty seven in number) are situated for the most part on the banks of the Indus, and extend southward from Ghotki in the Rohri deputy collectorate to the middle delta. They are described as narrow strips of land, from two to three miles in length, and ranging from two furlongs to two miles in breadth. The largest are between 9000 and 10,000 acres in area, but are subject to diminution owing to the encroachments of the stream. The wood is principally *babul* (*Acacia arabica*), *bahan* (*Populus euphratica*), and *kandi* (*Prosopis spicigera*). The *tali* (*Dalbergia Sissu*) grows to some extent in Upper Sind; the iron wood tree (*Tecoma undulata*) is found near the hills in the Mehar districts. There are, besides, the *nim* (*Melia Azadirachta*), the *pipal* (*Ficus religiosa*), the *ber* (*Zizyphus Jujuba*). The delta has no forests, but its shores abound with mangrove trees. Of trees introduced by the forest department we have the tamarind (*Tamarindus indica*), several Australian wattle trees, the water chestnut (*Trapa natans*), the *aula* (*Emblica officinalis*), the *bahera* (*Terminalia Bellerica*), the carob tree (*Ceratonia Siliqua*), the China tallow (*Stillingia sebifera*), the *bel* (*Ægle Marmelos*), and the mahah (*Bassia latifolia*). There is a specially organized forest department.

Territorial divisions. For administrative purposes the province has five well understood divisions:—(1) *Frontier*, *Upper Sind*, of which the principal town is Jacobabad, named after the late General John Jacob, C.B., its founder; the hamlet which occupied its site in 1843 was a mere speck in the desert, and its name, Khangarh, can hardly be associated with the fine canal and abundant vegetation now marking the locality; (2) *Shikarpur*, with its capital of the same name and Sakhar, both notable places on the right bank of the Indus; in this division also are the towns of Larkhána and Rohri, the last on the left bank of the river; (3) *Hyderabad* (*Haidarabad*), of which the chief town, having the same name, was the capital of the province prior to the British occupation; (4) *Kurrachee* (*Karachi*), with its modern Europeanized capital and harbour and Tattha, a town of interesting local associations; (5) *Thar and Parkar*, an outlying district on the south east, more or less part of the desert tract extending far and wide in that particular quarter. Besides these there is the territory of Mir 'Ali Murad, Talpur, greatly curtailed of its original dimensions, but still forming a large land alienation in Upper Sind.

Revenue. Where cultivation depends so much on the character of the year's inundation, it is natural that the revenue should be uncertain. In 1883–84, for instance, the river was abnormally low. Consequently the area of cultivation was contracted, and, while considerable remissions had to be granted, collections were with difficulty carried out. The rainfall, moreover, except in the Thar and Parkar district, was not only scanty but unseasonable. In Thar and Parkar the rainfall was especially favourable, and owing to an early inundation and wise preparations lands never before cultivated were brought under the plough.

The gross canal revenue in Sind amounted in 1883–84 to Rs 3,686,754, and the land revenue to Rs 1,171,925. In round numbers and English figures—without reference to the deterioration of the rupee—the total is about £487,000, of which three-fourths is due to canal irrigation.

Population. The population may be roughly reckoned at two millions and a half, an estimate which is borne out by the census of 1881. Kurrachee is now the most populous of the capitals, and its numbers far exceed those of Shikarpur and Hyderabad. But the character of its inhabitants differs from that of other large towns in Sind. They are for the most part foreign and migratory, and do not represent the true Sindis.

Races and castes. Of the two great divisions of the people in Sind the Mohammedans comprise about two thirds of the whole, the Hindus the remaining third. The Mohammedans may be divided into two great bodies—the Sindis proper and the naturalized Sindis. The Sindi proper is a descendant of the original Hindu. In religion he is a Súni, though some of the Sindis belong to the Shia sect. There are probably more than three hundred families or clans among the Sindis. There is, as a rule, no distinction of caste, except that followers of certain vocations—such as weavers, leather-workers, sweepers, huntsmen—are considered low and vile. The six different classes of naturalized Sindis are—the four families of the Saiyids (the Bokhári, Mathari, Shirázi, and Lakhiáyri), the Afghans, from Khorasan, the Baluchis, the slaves or Sídís—originally Africans; the Memans, and the Khwájas. The Hindu population of Sind may be divided into the following principal castes:—the Brahmans, Kshatrias, Waishias, and Súdras, with their subdivisions. Besides these there are the Sikhs, and the religious mendicants—the Sanási, Jogi, Gosáin, and Ogar,—all of Brahman origin.

Education. The educational progress made in Sind during the quarter of a century succeeding the mutiny has been very great. In 1858 there was but one Government English school, with 82 boys, at Kurrachee, and one with 25 boys at Hyderabad, and of the 82 only 8 of the pupils were Sindi. In 1884–85 Sind could boast of a Government high school at Kurrachee with 400 pupils, of another high school at

Hyderabad with 338 pupils, and of a third at Shikarpur with 228 boys. The three passed 39 out of 48 candidates for matriculation at the Bombay university. Of vernacular or Sindi Persian schools under native masters there were 34 which came under Government supervision in 1858, whereas there were in 1884–85 no less than 23 middle schools—teaching the vernacular and English—with 1165 pupils, and in the primary schools the number of pupils was nearly 20,000.

Language and literature. Captain (now Sir Richard) Burton has given a clear and instructive account of the language and literature of Sind. The large proportion of Sanskrit and Arabic words admitted, the anomalous structure of the grammar, and the special sounds of certain letters of its alphabet render the first remarkable, and the original romantic poems and translations of Arabic religious works command the attention of scholars to the second. Among the more celebrated of the native writers are Makhdum Háshim, Makhdum Abdullah, and Saiyid Abdu'l-Latif.

History. The leading features of the two years' campaign of Alexander the Great in the Punjab and Sind have been touched on elsewhere (see INDIA, vol. xii. p. 787). About 711 A.D. the Hindus of Sind were conquered by Muhammad Kasim, the young general of the caliph Walid, but his successors were unable to hold their ground. In reality it was the overwhelming irruption of Mahmúd of Ghazni three centuries later which finally subjugated the province. Nearly six centuries later still, Sind was annexed by the great Akbar to Delhi. In the meanwhile it had been governed by princes and petty chiefs, all of whom are celebrated in local history. After Akbar, and up to the time of Nadir Shah's invasion of India, there is little historically important to distinguish the province, separated from the other divisions of the Mughal empire, though its governors possessed a certain delegated power which might well have tempted the more ambitious to revolt. When Nadir took possession of the lands west of the Indus, one Núr Muhammad Kalhora was the *quasi* ruler in Sind. The tribe to which he belonged claimed lineal descent from Abbas, uncle of the prophet, and had a widely-spread repute for sanctity. Their political influence had been, moreover, increasing for many years, and in the person of one or two of their stronger chiefs they had on sundry occasions risen in arms against the imperial troops. In 1701, or thirty-eight years before the Persian invasion, Yar Muhammad Kahora had obtained possession of Shikarpur, and managed to get from the Mughal emperor a firman conferring upon him the "subahdári" of the Déra districts, with the title of "Khuda Yár Khan." On his death in 1719 he had extended his territory by the acquisition of the Kandiára and Larkhána districts, and of Sibi, a vast tract of country then including within its limits Sakhar as well as Shikarpur. He was succeeded by his son Núr Muhammad, who, as above shown, was in the unenviable position of having to account for his actions to no less notable an antagonist than Nadir himself. The latter was eventually appeased by an annual tribute of 20 lakhs of rupees, and on his return to Persia conferred upon the Kalhora prince the title of "Shah Kuli Khan." On Nadir's death the Sind lands of Núr Muhammad became tributary to Ahmad Shah of Kandahar, the transfer being sealed by the bestowal of a new title, "Shah Nawáz Khan." This occurred in 1748, from which date till 1783—when Abdul Nabi, the last of the Kalhora princes, was defeated by Mir Fath Ali Khan, and the ruling dynasty forcibly superseded by the Talpúr Baluch chiefs—the local history is a mere record of conflicts and reconciliations, treaties and evasions of treaty, as regards outside powers, and of revolution and bloodshed within. The seat of government had become established at Hyderabad, founded by Ghulam Shah Kalhora in 1768. We now come to the Talpúrs. These Baluchis had immigrated to Sind from their native hills under a Mir Shahdad in the early part of the 18th century, and had taken service under Núr Muhammad Kalhora. Shahdad, raised to rank and influence, died, leaving four sons, the third of whom, Mir Bahram, succeeded as head of the tribe. His murder by a grandson of Nur Muhammad was one of the main causes of the ill-feeling which had culminated in bitter hostility when later acts of treachery and barbarism sealed the fate of the tyrant rulers. The Talpúrs entered Hyderabad as conquerors, but unfortunately for the consolidation of their sovereignty the suspicious nature of Mir Fath Ali, the head of the house, alarmed his near relatives. His nephew Sohrab fled to Upper Sind, and founded the principality of Khairpur, while Tára, moving eastward, became the independent chief of Mirpur. Later on, Mir Fath Ali, undeterred by divisions which he had no power to prevent, admitted to a share of his own government of Hyderabad his three younger brothers, Ghulam Ali, Karim Ali, and Murad Ali. On the death of Fath Ali in 1801 the three continued to rule together, and when Ghulam Ali was killed in 1811 the duumvirate remained supreme, but, on the death of Karm Ali in 1828 and Murad Ali a few years later, the old system was revived, and a government of four again instituted. Such was the state of things when British relations with the province had become necessarily an urgent consideration, owing to the Afghan expedition of 1838 (see vol. xii. p. 807).

During this crisis of Anglo-Indian history the political officers in Sind and Baluchistan had a difficult task to perform, and it is infinitely to their credit that more mischief did not ensue in these countries from the many and heavy British disasters in the north. But the amirs of Sind were to be dealt with for infractions of treaty if not for open hostility, and Sir Charles Napier had to call them to account soon after his arrival at Sakhar in the autumn of 1842. The long and complex narrative need not be here repeated. Suffice it to state that the outcome was the conquest of Sind,—the immediate result of the battle of Miáni, fought in the vicinity of Hyderabad in February 1843. A course of wise, firm, and kindly administration inaugurated by Sir Charles Napier himself, and continued by Messrs Pringle, Frere, Inverarity, Gen. John Jacob, Sir W. Merewether, and later commissioners, has since made the province an important section of the western presidency of India. The story of the eight years' rule of Sir Bartle Frere in Sind has yet to be written, but his name is associated with numerous matters of paramount importance,—in relation especially to the position and fortunes of the deposed amírs, the rights and immunities of the old privileged landholders, the organization of municipal institutions, the promotion of systematic education, the due administration of justice, and the erection of public works of utility.

(F. J. G.)

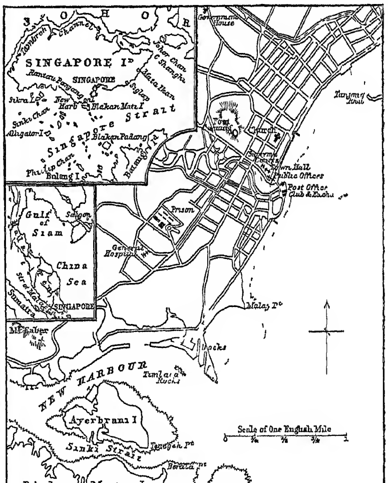
SINGAN, a form of the name SE-GAN FOO (*q.v.*).

SINGAPORE, a British dependency, commercially and administratively the most important of the STRAITS SETTLEMENTS (*q.v.*), which form a separate colonial government. It consists principally of an island 27 miles long by 14 broad, lying off the south end of the Malay Peninsula, but also includes upwards of 70 insignificant islets



Singapore and its Environs

to the south and west within a radius of 10 miles. From the mainland of Johor, as this part of the peninsula is called, Singapore island is separated by a strait, Salat Tabras or Tambrosh, less than half a mile wide at the narrowest point, which was formerly the main channel of navigation to the Chinese seas. The name of Singapore Strait is given to the much wider channel which separates the island on the south from the various islands of Butang, Batang, Bintang, &c., belonging to the Dutch East Indies. The surface of Singapore is undulating, and diversified by hills ranging from 70 to rather less than 400 feet, the highest point being Bukit Timah, to the north-west of the town (about 519 feet). Geologically

the core of the island consists of crystalline rocks, but in the west there are shales, conglomerates, and sandstones, and all round the island the valleys are filled with alluvial deposits on a much more extensive scale than might be looked for where none of the streams have a course of more than six miles, or attain to any considerable size except after heavy rains (see details in J R Logan's "Local and Relative Geology of Singapore," in *Journ Beng As Soc*, vol xvi, and "The Geology of the Straits of Singapore," in *Lond Geol Jour*, 1851, vol vii) The south-western shores are fringed with coral reefs, and living coral fields are found in many parts of the strait Being chiefly composed of red clays and laterite, the soil is not generally rich, and requires careful and liberal husbandry to make it really productive When it was first occupied by the English the whole island was covered with forest and jungle, and, although this was largely cleared off subsequent to 1837, when a mania for nutmeg plantations set in, the moisture and warmth of the climate have kept it clothed with luxuriant and perpetual verdure, in which palms, ferns, and orchids are conspicuous forms "Near the shore, by the mouths of creeks, are grouped quaint dwellings of fishermen, built of wood or palm leaf standing on piles over the water In the smooth sandy bays cocoa-nut palms shelter picturesque Malay houses More inland we find groves of fruit trees, small patches of sugar-cane, Chinese gardens, tapioca and indigo fields Neat bungalows—the residences of officials, merchants, and rich Chinese and Arabs—diversify the scene, particularly in the vicinity of the town In the remote parts of the island more especially there are waste spaces which were formerly gambier plantations and are now covered with coarse lalang grass" (Governor Wild) The nutmeg trees which had for twenty years been a main source of wealth were blighted in 1860, the plantations were completely given up, and, though many of the abandoned trees recovered and nutmegs can still be gathered in Singapore, they have never again been cultivated Cotton-planting was next tried, but without success, and though cinnamon grows well the labour necessary for its cultivation and manufacture is too expensive Gutta percha, originally introduced to England from Singapore, was so much run upon that all the trees of that kind in the island were exterminated Gambier and pepper, both at one time largely grown, have for many years been of little account Liberian coffee, pine-apples, cocoa-nuts, and aloes are now the most important objects of cultivation Quite recently districts have been enclosed for reforestation and the eucalyptus and other trees have been planted Almost all kinds of fruits do well in the island,—the custard-apple, pine-apple, sour-sop, lime, orange, and plantain being in season nearly all the year, and the durian, blimbing, duku, langsat, mangosteen, rambutan, tarrup, tampang, &c, in July and August and also for all or some of the months between November and February The botanical and zoological gardens at Singapore, connected with the Agri-Horticultural Society, have been devoted to the introduction of economic plants, such as China and Assam tea, salt-bush or *Rhagodia*, which forms excellent fodder, &c

In climate Singapore is wonderfully fortunate for a country within one degree of the equator There is hardly any seasonal change, and the annual range of temperature is generally only from 70° to 90° "The nights especially are very cool and refreshing, and enable people to sleep without difficulty" The atmosphere is almost uniformly serene, and the face of the ocean is only disturbed by the swell of distant tempests in the China Sea or the Bay of Bengal The north east monsoon is the master wind from November to April, but is generally neither persistent nor powerful, and the south-west monsoon is even less regular in its action The southerly winds in May and June known as Java winds have very much the character of land and sea breezes, but are considered very enervating in spite of the pleasant feeling of freshness which they at first produce Rapid squalls (sumatras) also occur during the south-west monsoon and beneficially clear the air Instead of periodical rains there are (on a sixteen years' average) 167 wet days distributed throughout the year The annual rainfall is 92 27 inches, 1885, a very dry year, showed only 69 inches, according to Dr Rowell's report The mean maximum temperature in the shade is 86° 7, the mean minimum in the shade 73° The highest temperature observed during the sixteen years was 94° in April 1878, and the lowest 65° in February 1874 Most of the domestic animals of Europe have been introduced, but not in great numbers Deer, wild hogs, sloths, monkeys, and squirrels are the more note-worthy mammals, and tigers, which formerly committed serious depredations among the natives, still occasionally find their way across the strait from the mainland When the first census was taken in 1824 the settlement of Singapore was found to contain 10,683 inhabitants, and by 1850 this number had increased to nearly 60,000 The following figures show the more important components of the population in 1860, 1871, and 1881,—the totals for those years being 80,792, 97,111, and 139,208 respectively —

	1860	1871	1881
Europeans and Eurasians	2,445	3,207	2,769
Malays	10,888	19,250	22,155
Klings, &c		10,244	12,058
Chinese	50,043	54,098	86,766
Javanese	3,408	3,239	5,881

The total is estimated to be now well over 150,000 The preponderance and rapid increase of the Chinese is a most striking feature, mainly due, however, to a steady stream of immigration The death rate in Singapore is very much higher than the birth-rate—4473 being the average number of deaths in 1881–83 against 1919 births This is largely to be ascribed to the paucity of women—33,785 females to 105,423 males in 1881 In the small number of Europeans proper—1283—there are nineteen nationalities represented

The only town in the settlement is the city of Singapore, the general capital of the Straits Settlements It lies on the south side of the island in 1° 16′ N lat and 103° 53′ E long, a bright, picturesque, prosperous, and progressive place, with a sea-frontage extending for about 6 miles from New Harbour north-east to the Rochore and Kallang suburbs Under the control of its municipality, which has a yearly revenue of more than 300,000 dollars, a great variety of improvements have been effected—the river dredged and deepened, foreshores reclaimed, bridges built, trees planted, and public buildings erected—within the last six or seven years The principal churches, the court-house, and the European quarters generally are situated on the north side of the river, while on the south side extend the warehouses and shops of the European and Chinese traders On Peel Hill, 170 feet high, stands a citadel, and on Government Hill is the Government house—a palatial residence in park-like grounds The cosmopolitan character of the population gives great brightness of colour to the crowded streets and is reflected in the architectural peculiarities of the native quarters—where Mohammedan mosques, Chinese joss-houses, and Hindu temples are equally at home Among the more important European edifices are St Andrew's cathedral (first consecrated in 1838, present building erected in 1861, became cathedral in 1870), the Roman Catholic cathedral, the supreme court-house, the new post office (1883–84), the new police courts (1884), the European hospital, the jail, the Tanglin barracks, and the Raffles school (dating from 1823) The Raffles public library and museum had 320 subscribers in 1885 and 34,250 visitors, the books issued numbering 16,348 Several English papers, as well as one Chinese and one Malay, are published at Singapore As a trading-port Singapore has great advantages over and above its position on the Straits The harbour is safe and has good anchorage, and it can be approached without the assistance of pilots from three directions New Harbour is the name of the channel which lies between the southern projection of the main island and the small island of Blakan Mati, and is divided by the still smaller island of Ayer Brani It is there that the Peninsular and Oriental Steam Navigation Company and the Messageries Maritimes have their docks and depôts At Tanjong Pagar there are two graving docks,—Victoria Dock having a length of 450 feet, a breadth of 65 feet, and a sill depth at spring tides of 20 feet, and the corresponding figures for Albert Dock being 470 feet, 60 feet, and 21 feet The two New Harbour Docks are respectively 415 and 459 feet long, and 42 and 62 feet broad, and have sill depths of 14–15½ and 19–20 feet At Pulo Brani, Bon Accord Dock has a length of 330 feet, a breadth of 50, and a sill-depth of 17 A large admiralty dock for the use of ships of the British navy is being constructed Opposite Singapore proper the sea shallows to a few fathoms The tides (tables of which were first published in 1884) are as yet imperfectly registered, but in general they consist of a principal high water and low-water succeeded by a secondary high water and low water of the most limited range

The commercial movement of the port has rapidly attained vast dimensions. While in 1851–52 the total exports and imports amounted to £5,739,556, they reached £10,371,300 in 1859–60, £18,292,180 in 1870, £23,050,943 in 1880, and £25,931,930 in 1883. There is no railway in the island, but in 1886 a steam tramway was opened from Tanjong Pagar to Elgin Bridge. Till quite recently the town was practically without defences, but since 1885 the colony has constructed a series of batteries at Sera pong, Blakan Mati, Mount Palmer, &c., at a cost of £75,000, and the home Government has expended £90,000 on the ordnance.

The name Singapore or Sinhapura, *i.e.*, Lion City, was originally given to a town founded by Hinduized Malay or Javanese settlers from Sumatra at an early date in the Christian era. The commercial importance of the place in the 14th century is attested by Barros, but the Sanskrit origin of the name had by his time been forgotten, and he was taught to derive it from Malay words. Not long afterwards the town must have fallen into decay, and at the beginning of the present century the only trace of its existence was certain rock-inscriptions in a very old character, and the whole island had not more than 150 inhabitants. Alexander Scott recognized the excellent position of the island in the 18th century, and Sir Stamford Raffles, whose attention was called to it by Captains Ross and Crawford of the Bombay marine, fixed on it as the site of the great commercial emporium which he determined to found for the encouragement of British trade in the East. In 1819 permission was obtained to build a British factory on the south coast, and in 1824 the island was purchased from the sultan of Johor for 60,000 Spanish dollars (£13,500) and a life annuity of 24,000 dollars (£5400). The city became the capital of the Straits Settlements instead of Prince of Wales Island in 1832.

See Belcher, *Voyage of the Samarang*, Collingwood's *Naturalist's Rambles in the Chinese Seas*, *The Directory of the Straits Settlements for 1886*, the *Journal of the Straits Branch of the Royal Asiatic Society*, published at Singapore, and other works quoted under the heading STRAITS SETTLEMENTS.

SINGBHUM, a British district in the lieutenant-governorship of Bengal, lying between 21° 59′ and 22° 53′ N. lat. and between 85° 2′ and 86° 56′ E. long. It has an area of 3753 square miles, and is bounded on the N. by the districts of Lohárdagá and Mánbhúm, on the E. by Midnapur, on the S. by the tributary states of Orissa, and on the W. by Lohárdagá and the tributary states of Chutiá Nágpur. Its central portion consists of a long undulating tract of country, running east and west, and enclosed by great hill ranges. The depressions lying between the successive ridges comprise the most fertile part, which varies in elevation above sea-level from 400 feet near the Subarnarekhá on the east to 750 feet around the station of Cháibásá. South of this an elevated plateau of 700 square miles rises to upwards of 1000 feet. In the west of the district is an extensive mountainous tract, sparsely inhabited by the wildest of the Kols, while in the extreme south-west corner is a still grander mass of mountains, known as "Saranda of the seven hundred hills," rising to a height of 3500 feet. From the Layádá range on the north-west of Singbhúm many rocky spurs strike out into the district, the more prominent of them attaining an elevation of 2900 feet. Among other ranges and peaks are the Chaitanpur range, reaching an elevation of 2529 feet, and the Kápargádi range, a conspicuous ridge rising abruptly from the plain and running in a south-easterly direction until it culminates in Turilgár Hill (2492 feet). The principal rivers are the Subarnarekhá, which with its affluents flows through the eastern portion of the district, the Koel, which rises west of Ranchi, and drains the Saranda region, and the Baitarani, which touches the southern border for 8 miles. About two-thirds of Singbhúm district is covered with primeval forest, containing some valuable timber trees; in the forests tigers, leopards, bears, buffaloes, and several kinds of deer abound, and small herds of elephants occasionally wander from the Meghásani Hills in Morbhanj. The climate is dry, and the hot season is extremely trying, the thermometer frequently registering 106° F. in the shade; the average annual rainfall is about 57 inches.

The census of 1881 disclosed a population of 453,775 (226,681 males and 227,094 females); Hindus numbered 447,810, Mohammedans 2329, and Christians 2988. The only town containing a population of more than 5000 is Cháibásá, the civil station and administrative headquarters of the district, with 6006 inhabitants. The staple crop of Singbhúm is rice, and the other chief crops are wheat, Indian corn, pease, gram, mustard, sugar cane, cotton, and tobacco. The principal manufactures are coarse cotton cloths, brass and earthenware cooking utensils, and soapstone platters. Cereals, pulses, oil-seeds, stick-lac, and iron comprise the chief exports; and the imports include salt, cotton thread, English cloth goods, tobacco, and brass utensils.

Colonel Dalton, in his *Ethnology of Bengal*, says that the Singbhum Rajput chiefs have been known to the British Government since 1803, when the marquis of Wellesley was governor-general of India; but there does not appear to have been any intercourse between British officials and the people of the Kolhán previous to 1819. The Hos or Larka Kols, the characteristic aboriginal race of Singbhúm district, would allow no stranger to settle in, or even pass through, the Kolhan; they were, however, subjugated in 1836, when the head men entered into engagements to bear true allegiance to the British Government. The country remained tranquil and prosperous until 1857, when a rebellion took place among the Kols under Parahat Rájá. After a tedious campaign they surrendered in 1859, and the capture of the raja put a stop to their disturbances.

SINHALESE. See CEYLON.

SINIGAGLIA, or SENIGALLIA (the official form), a city of Italy, in the province of Ancona, in 43° 43′ 16″ N. lat., on the coast of the Adriatic, 17 miles by rail north of Ancona. It is well built, with broad and well-paved streets, and has the general appearance of a thriving commercial town. A modern cathedral, erected subsequent to 1787, a large Jewish synagogue, a theatre, the communal buildings, and the old palace of the dukes of Urbino are the more notable buildings. The communal library was founded by Cardinal Nicola Antonelli in 1767; and the principal hospital and one of the orphanages date from 1534. The port is formed by the lower reaches of the Misa, a small stream which flows through the town between solid embankments constructed of Istrian marble. Between July 20 and August 8 Sinigaglia annually holds one of the largest fairs in Italy, which dates originally from 1200, when Sergius, count of Sinigaglia, received from the count of Marseilles, to whose daughter he was affianced, certain relics of Mary Magdalene. The fair has diminished in importance since the opening of the railway, but formerly it used to be visited by merchants from France, Switzerland, Austria, Germany, and especially the Levant. The population, exclusive of the suburbs, was 10,501 in 1861 and 6634 (commune 22,499) in 1881.

Sinigaglia is the ancient *Sena* (Σήνη) or (to distinguish it from Sena Julia, *i.e.*, Siena) *Sena Gallica*, a town of the Galli Senones (Σήνωνες), whose name appears as Senogallia as early as Pliny. Sena was made a Roman colony immediately after the conquest of the Senones in 289 B.C. It was the rendezvous of the consuls Livius and Nero before the battle of the Metaurus, also known as the battle of Sena, in which Hasdrubal was defeated (207 B.C.). The sack of the town by Pompey, Sulla's lieutenant, in 82 B.C., is the only other notable fact in its ancient annals. Ravaged by Alaric, fortified by the exarch Longinus, and again laid waste by the Lombards in the 8th century and by the Saracens in the 9th, Sinigaglia was at length brought so low by the Guelf and Ghibelline wars, and especially by the severities of Guido de Montefeltro, that it was chosen by Dante as the typical instance of a ruined city. In the 15th century it was captured and recaptured again and again by the Malatesta and their opponents. Sigismond Malatesta of Rimini erected strong fortifications round the town in 1450–1455. The lordship of Sinigaglia was bestowed by Pius II. on his nephew Antonio Piccolomini, but the people of the town in 1464 placed themselves anew under Paul II., and Giacomo Piccolomini in 1472 failed in his attempt to seize the place. Sixtus VI. assigned the lordship to the Della Rovere family, from whom it was transferred to Lorenzo di Medici in 1516. After 1624 it formed part of the legation of Urbino.

SINKING FUND. See NATIONAL DEBT, vol. xvii. p. 245.

SINOPE, or in Turkish SINÛB, a town and seaport on the north coast of Asia Minor, on the isthmus and peninsula of Boztepeh, which forms part of the most northerly projection of the Anatolian seaboard. Though

it possesses the finest natural harbour save one in the Black Sea, defective communication with the interior, and the consequent rivalry of Ineboli (since about 1848), have prevented Sinope taking its natural position as a great commercial centre But between 1882 and 1885 roads have been constructed which give direct access southward to Cæsarea and even to Tarsus, near the south coast The town still bears the stamp of its former importance. On the isthmus stands a huge but for the most part ruined castle, originally Byzantine and afterwards strengthened by the Seljuk sultans, and the old town is surrounded by Byzantine walls Of early Roman or Greek antiquities there is little trace, but the ancient local coinage furnishes a very beautiful and interesting series of types (see M J P Six's paper in *The Numismatic Chronicle*, 1885) The population has not greatly changed since 1868, when it was found to be 9668 inhabitants, of whom 7299 were Mohammedans and 2369 Greeks and others

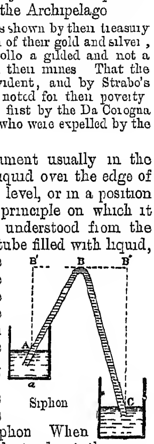
Sinope (Σινώπη), whose origin was mythically assigned by its own ancient inhabitants to Autolycus, a companion of Hercules, was colonized by the Milesians, and ultimately became the most flourishing Greek settlement on the coast of the Euxine In the 5th century B C it received a colony of Athenians, and by the 4th it had extended its authority over a considerable tract of country and become itself the mother of several colonies—Cerasus (Kerasûn), Trapezus (Trebizond), Cotyora, &c Its fleet was practically dominant in the Euxine, except towards the west, where it shared the field with Byzantium When in 220 B C Sinope was for the first time attacked by the king of Pontus, the assistance of the Rhodians enabled it to maintain its independence But where Mithradates IV failed Pharnaces succeeded, and the city, taken by surprise in 183 B C, became the capital of the Pontian monarchy Under Mithradates the Great, who was born in Sinope, it had just been raised to the highest degree of prosperity, with fine buildings, naval arsenals, and well built harbours, when the Romans under Lucullus and Pompey effected the subjugation of Pontus In 64 B C the body of the murdered Mithradates was brought home to the royal mausoleum Under Julius Cæsar the city received a Roman colony In the Middle Ages it became subject to Trebizond, and in 1470 it passed into the hands of the Turks In November 1853 the Russian vice admiral Nakhimoff destroyed here a division of the Turkish fleet and reduced a good part of the town to ashes

SIOUX CITY, a city of the United States, the capital of Woodbury county, Iowa, lies 156 miles north-west of Des Moines, on the sloping banks of the Missouri river It is a great railway centre (Chicago, Milwaukee, and St Paul Railway, Sioux City and Pacific Railway, &c), has an extensive trade, and contains an opera house, foundry and machine shops, pork-packing factories, and mills The population of the city (which was laid out in 1854 and incorporated in 1857) was 3401 in 1870 and 7366 in 1880 (township 7845)

SIPHANTO, SIPHENO, or SIPHNO (ancient Greek Σίφνος), an island of the Greek Archipelago, in the nomarchy of the Cyclades, 30 miles south-west of Syra It has an area of 28 square miles, and the population in 1879 was 5762 A ridge of limestone hills—whose principal summits, Mount Elias and St Simeon, are crowned by old Byzantine churches—runs through the island, for about 2 miles along the western slope stretches a series of villages, each white-washed house with its own garden and orchard Apollonia, one of the five (so called because built on the site of a temple to Apollo), is the modern capital, formerly this rank belonged to Kastro (also called Seraglio), an "old-world Italian town" with mediæval castle and fortifications, and an old town-hall bearing date 1365 Inscriptions found on the spot show that Kastro stands on the site of the ancient city of Siphnos, and Mr Bent identifies the other ancient town of Minoa (see Stephanos) with the place on the coast where a Hellenic white marble tower is distinguished as the Pharos or lighthouse and another as the tower of St John Churches and convents of Byzantine architecture are scattered about the island One building of this class is especially interesting—the school of the Holy Tomb or school of Siphnos, founded by Greek refugees from Byzantium at the time of the iconoclastic persecutions, and afterwards a great centre of intellectual culture for the Hellenic world The endowments of the school are now made over to the gymnasium of Syra In ancient times Siphnos was famous for its gold and silver mines, the site of which is still easily recognized by the excavations and refuse-heaps A French company has started mining operations at Kamara As in antiquity so now the potters of the island are known throughout the Archipelago

The wealth of the ancient Siphniotes was shown by their treasury at Delphi, where they deposited the tenth of their gold and silver, but, says the legend, they once sent Apollo a gilded and not a golden bull, and he in his anger flooded their mines That the mines were invaded by the sea is still evident, and by Strabo's time the inhabitants of the island were noted for their poverty During the Venetian period it was ruled first by the Da Corogna family and after 1456 by the Gazzadini, who were expelled by the Turks in 1617

SIPHON, or SYPHON, an instrument usually in the form of a bent tube for conveying liquid over the edge of a vessel and delivering it at a lower level, or in a position of less hydrostatic pressure The principle on which it acts (see HYDROMECHANICS) may be understood from the accompanying diagram ABC is a tube filled with liquid, the shorter limb dipping under the surface of the liquid in jar *a*, the longer in jar *b* The pressure in the tube at A is atmospheric pressure minus that of the vertical column AB′, while that at C is atmospheric pressure minus that of the column CB″ When CB″ is longer than AB′ the pressure at C is of course less than that at A, and a current flows in the direction ABC through the siphon When AB′ = B″C, that is, when the liquid stands at the same level, pressure is equal in the two limbs, and the current ceases



Siphon

The siphon has practically a certain minimum diameter for each liquid, as capillarity prevents a fluid from flowing out of tubes of very small bore unless under the influence of electricity, heat, or great pressure The instrument is largely employed for chemical work, both in the laboratory and in manufacturing processes, it is formed of glass, india-rubber, lead, or other substance, according to the purpose for which it is intended The simple siphon (see fig) is used by filling it with the liquid to be decanted, closing the longer limb with the finger and plunging the shorter into the liquid, and it must be filled for each time of using Innumerable forms have been devised adapted for all purposes, and provided with arrangements for filling the tube, or for keeping it full and starting it into action automatically when required The former purpose is usually effected by blowing into the vessel through a second opening in the stopper through which the siphon passes, or by means of a sucking or blowing tube attached to the longer limb, or by pouring in liquid through a flexible tube attached at the bend The second plan is frequently realized by having a stop-cock on the longer limb and a valve opening upwards on the shorter, or by having both limbs of equal length and each standing in a cup, in which case when the level changes in either cup the siphon tends to equalize it by conveying liquid from the higher to the lower Many other forms are in constant use in the arts, and the siphon is also employed in some of its modifications in surgery, in engineering, and in other sciences

SIRACHIDES See JESUS, THE SON OF SIRACH

SIRÁJGANJ, a town in the district of Pabna, Bengal,

and the most important river-mart in that province, is situated near the Jamuná or main stream of the Brahmaputra in 24° 26′ 58″ N. lat. and 89° 47′ 5″ E. long., with a population of 21,037 (11,213 males and 9824 females) in 1881. The business of Sirájganj is that of a changing station; the agricultural produce of the surrounding country is brought in in small boats and transferred to wholesale merchants for shipment to Calcutta in steamers or large cargo boats, and in return piece goods, salt, hardware, and all sorts of miscellaneous articles are received from Calcutta for distribution. Sirájganj is also the centre of the jute trade of Eastern Bengal.

SIR-DARIA. See SYR-DARYA.

SIREDON. At the end of last century specimens of a kind of branchiate tailed Amphibian were brought to Europe from the lakes of Mexico; they were examined by the zoologists of Paris and described by Cuvier in Humboldt's *Recueil d'Observations de Zoologie*, vol. i., and by Daudin in *Hist. des Reptiles* (Paris, 1802–1804), under their native name of "Axolotls." The animals were named *Siren pisciformis* by Shaw (*Zool.*, vol. iii.). Wagler, in his *Natürliches System der Amphibien* (Stuttgart, 1828–1833), separated the axolotl from the Linnæan genus *Siren* and called it *Siredon axolotl*, and later writers have often referred to the animal under the name *Siredon pisciforme*, Shaw.

The axolotl of Mexico is about 6 or 7 inches in length; it has four pairs of gill-slits and three pairs of long feather-like external branchiæ. The branchial apertures are between the hyoid arch and the first branchial arch, and between the first-second, second-third, and third-fourth branchial arches. The branchiæ are attached to the first, second, and third branchial arches. The body is cylindrical, and a median membranous fin extends along the trunk dorsally, is continued along the tail, passes round the end of the latter and terminates ventrally at the anus. It has four limbs, which are short and somewhat stout; the anterior terminate in four and the posterior in five digits. The colour of the axolotl is a uniform black.

The animal is therefore, except in size, very similar to the aquatic larva of *Triton*, or other Salamandroid, and Cuvier expressed the opinion that it was a larval form which for some unknown reason was unable to attain the adult condition. That it could not be considered simply as the larva of an unknown species of Salamandroid was evident from the fact that it possessed fully developed sexual organs in both sexes. There was every reason to believe that it bred freely in the branchiate condition in which it was discovered. The animal is so common in the lakes near the city of Mexico that it is brought regularly to market and used largely by the Mexicans as food (9).[1]

If nothing more than the above were known about the axolotl it would be classed among the *Perennibranchiata*, in the family *Proteidæ*, having its nearest ally in the genus *Menobranchus*. Up till the year 1865 no actual observations had been made by zoologists on the breeding of the axolotl: all that was known was that the genital organs in many of the specimens examined were in perfectly mature condition. In that year, on January 18, 6 axolotls, 5 males and 1 female,—which had been living for a year in the menagerie of reptiles of the Musée d'Histoire Naturelle at Paris,—began to breed, and the deposition and hatching of the eggs was carefully studied by Prof. A. Duméril (1). The eggs were 2 mm. in diameter, and the period of development within the egg was 28 to 30 days; the larvæ were hatched in February, and were 14 mm. to 16 mm. in length. In the beginning of September, when the larvæ had almost reached the size of the parents, it was noticed that one of them was undergoing a metamorphosis similar to that of the larval *Triton* to the adult. In a short time yellow spots appeared on the skin, the branchiæ disappeared, the gill-slits closed up, the median fin disappeared, the animal began to breathe air and permanently quitted the water. The same process of metamorphosis was repeated by several of the larvæ, until finally out of several hundred about thirty reached the salamandroid condition. The parents in the meantime were still alive, and had undergone no change. When the structure of the transformed specimens was examined, they were found to resemble in all generic characters the genus *Amblystoma*, of which several species were known, inhabiting various parts of North America.[2] The consideration of Duméril's discovery gives rise to several perplexing questions, which have been discussed by many zoologists experienced in the study of the *Amphibia*, and even now can scarcely be said to be completely settled. The first question is—To what species of *Amblystoma* did the transformed axolotls of Duméril belong? Duméril himself, in the full account (2) which he published concerning the animals and their metamorphosis, was unable to give a decided opinion concerning the identification of the species of his *Amblystoma*, but on a subsequent occasion he confirmed the suggestion of Prof. E. D. Cope (10) that the specific characters were those of *A. mavortium*, Cope (described in *Proc. Ac. Philad.*, 1867).

The publication of Duméril's discovery excited a great deal of interest among European naturalists, and for a time experiments and observations on axolotls in captivity were carried on with great earnestness. The metamorphosis in the case of Duméril's specimens had taken place quite unexpectedly, but the case seemed to offer an opportunity for ascertaining the action of definite conditions in producing definite processes of growth. Marie von Chauvin (6), at Freiburg, at the instigation of Prof. Weissmann, attempted, and with perfect success, to transform young axolotls into the *Amblystoma* form by gradually bringing the animals from water into air.

The transformed axolotls observed by Duméril were kept alive in the Paris Museum, and for ten years showed no symptoms of breeding or sexual activity. It was currently believed that the *Amblystoma* derived from the metamorphosis of *Siredon* was sterile. This belief ultimately proved erroneous. In the autumn of 1874 the animals in the menagerie of reptiles were transferred to new premises, where they were all placed in more healthy conditions. Immediately after this the *Amblystoma* deposited fertilized eggs, and the fact was reported by M. Blanchard to the Académie des Sciences (4), with the comment that the *Amblystoma* was thus shown to be similar to other cold-blooded animals which were capable of reproducing in both the young and the adult condition.

Although at first Duméril believed and stated that his specimens of axolotl belonged to the species which bears that name in Mexico, he afterwards, in his more detailed work on the subject (2), explained that the grounds for his first opinion had been insufficient. American zoologists, especially Baird and Cope, had distinguished several species of *Siredon*, and Baird had separated the Mexican species, which alone was originally called axolotl, as *Siredon mexicanus*. Duméril came to the conclusion that the axolotls in the Paris Museum were identical with *Siredon lichenoides*, Baird (described in Stansburg, *Exped. Gr. Salt Lake, Utah*). All the axolotls which were kept and studied and subjected to experiment by naturalists on the Continent after Duméril's discovery were descendants of the Paris specimens, so that the results obtained really did not necessarily prove anything with regard to the true Mexican axolotl, *Siredon mexicanus*, if that were really a distinct species. There is no evidence in literature to show whence the first axolotls in the Paris Museum were obtained. It was evident that *Siredon lichenoides* was capable of breeding in both the larval and the salamandroid condition, and that its metamorphosis in captivity in Europe was rare and to a certain extent controlled by definite external conditions. Prof. O. C. Marsh has recorded his experience of the metamorphosis of *S. lichenoides*. He obtained several specimens from alpine lakes 7000 feet above the sea in Wyoming Territory, and some of these metamorphosed into *Amblystoma mavortium*, Cope. Marsh does not say if the larvæ he obtained were sexually mature, nor did he ascertain if breeding of the species in the larval condition took place at all in the lakes he visited; he thinks it probable that the metamorphosis in that region was rare in the natural conditions.

The metamorphosis of the true axolotl, undoubtedly obtained from the Lake of Mexico, seems to have been observed only once—namely, by Tegetmeier in London. That naturalist had 5 specimens, and one of them underwent the metamorphosis. In 1871 Cope (10) stated that no one had seen the metamorphosis of the true siredon, *Siredon mexicanus*, Baird, and that no *Amblystomæ* had been obtained from Mexico south of the Tropic of Cancer, while

[1] These numerals refer to the "Literature" *infra*.

[2] The generic characters of *Amblystoma*, Tschudi, are, according to Boulenger—tongue subcircular or oval, with radiating plicæ, lateral borders free, anterior border slightly free; two transverse series of palatine teeth in same straight line, not separated by a wide interspace in the middle; toes five; tail more or less compressed.

the true axolotl is found south of that line He was unaware of Tegetmeier's observation He further declared that Prof Baird was aware of the metamorphosis of all the North American species of *Siredon* so-called, excluding *S mexicanus*, years before the observation of it by Duméril, though he had at first named one of them *Siredon lichenoides*, in the belief that it was adult Cope considered the observation of Duméril important, as showing that siredons reproduced as such

Finally, according to Boulenger (7), the *S lichenoides* and *mexicanus* of Baird are synonymous, the Paris axolotl is identical with the same species, and the perfect form into which it changed is identical with *A tigrinum*, *mexicanum*, and *mavortium* of Cope, *obscurum* of Baird, while the form named *Siredon gracilis* by Baird is probably the larva of *Amblystoma tenebrosum* Boulenger adopts the name *A tigrinum* of the synonyms given above, and gives as the distribution United States and Mexico, the specific diagnosis is—series of palatine teeth extending to external fissure of choanæ, plicæ of tongue radiating from behind, costal grooves twelve, head large, brown or blackish, with yellow markings

It is therefore very probable that the Paris specimens were really Mexican axolotls, and there is no doubt that these animals do in captivity undergo metamorphosis So far as is known, they never do so in their natural conditions But the animals are specifically identical with *A tigrinum*, which is found in many parts of the United States, from New Jersey to California, and normally breeds in the salamandroid condition It is not known at present whether the larva of *A tigrinum* ever attains sexual maturity in other regions where the species occurs besides Mexico It is not improbable that it does so De Filippi (8) found in a marsh on the shores of the Lago Maggiore 48 larvæ of *Triton alpestris* in the branchiate condition, which contained fully developed ova and spermatozoa, so that the occurrence of sexual maturity in the larvæ of *Amblystoma* is not unique Prof August Weissmann (5) has discussed at considerable length and with much thoughtfulness the true significance of the phenomena exhibited by the axolotl, and has concluded that its ancestors passed through the normal life history of *Amblystoma*, the climate of the Mexican tableland having been at one time moist enough to permit of the existence of a terrestrial Salamandroid, that the climate has now became so dry and unfavourable to vegetation that no amphibian can live in it except in water, and that *Amblystoma* has become adapted to these conditions by ceasing to pass through its metamorphosis, and breeding entirely in the branchiate condition Thus the metamorphosis which takes place occasionally in captivity is a case of what has been called since Darwin's epoch atavism, its peculiarity consists in the fact that the evolution of the animal has resulted in the arrest of development at a larval stage, and the occasional reversion is the continuation of the development to the higher condition of the ancestor Atavism is the occasional resemblance of one individual to some remote ancestors instead of to its immediate parents Another possible way of explaining the axolotl is to suppose that it has remained in the perennibranchiate condition while other members of the same species elsewhere have developed into the salamandroid condition This explanation cannot be the true one It would necessitate the belief that a metamorphosis lasting a few days or weeks, and induced often by the gradual removal of the animal from water into air, could produce the same specific characters as a gradual development which has occupied a great number of generations The axolotl is an example of one of the most curious and interesting modes by which animals may be adapted to their conditions, and two species formed out of one At present the disappearance of the metamorphosis from the life-history of the axolotl has taken place so recently that not even specific differences exist, according to some observers, between the metamorphosed axolotl and the natural *Amblystoma tigrinum* At some future time slight differences are almost sure to occur, and then there will be two species or the tendency to metamorphosis in the axolotl will be lost In the latter case some slight differences will probably be developed between the axolotl and the branchiate larva of *A tigrinum* in other parts of America, and then the axolotl and *A tigrinum* will be two species Finally, it may be pointed out that it is possible that the axolotl could have reached its present locality and conditions without any change in the climate of Mexico The lakes in the arid district might somehow occasionally be visited by breeding *A tigrinum*, and of the larvæ so produced in them some might become sexually mature before metamorphosing, and so give rise to the present axolotls

There is some reason to believe, according to the American zoologist Prof Cope, that the perennibranchiate *Menobranchus lateralis*, Tschudi, of the Mississippi, which when full grown is over a foot in length, and has four branchial apertures, stands in the same relation to the genus *Batrachoseps*, Bonap, as *Siredon* to *Amblystoma*

SIREN *Siren lacertina*, Lin (*Syst Nat*, i, Addenda), is an animal belonging to the class AMPHIBIA (*q v*) It forms the type of the family *Sirenidæ*, called by Prof Huxley *Trachystomata*, among the group *Perennibranchiata* The body is elongate and eel-like, only the anterior limbs being present, the posterior are entirely wanting The anterior limbs are short and feeble, and each is furnished with four digits pointed at the ends The head is small, the snout is short and broad, and the nostrils are placed at its extreme end The tongue is free anteriorly The jaws are destitute of teeth and covered with a horny sheath like a beak There are numerous teeth on the vomer, arranged in two large patches converging anteriorly The eyes are very small On each side of the neck are three branched external gills attached to the first, second, and third branchial arches, and below the gills are three reduced branchial apertures The tail is shorter than the body, much compressed, and provided with a median membranous fin, the tail terminates in a point The skin is smooth, and black in colour, sometimes sprinkled with white dots *Siren* grows to a large size, some specimens measuring 3 feet in length, the largest example in the British Museum is 670 mm or about 2 feet 3 inches The animal inhabits the stagnant waters of marshes in South Carolina and Texas.

The only other member of the family *Sirenidæ* is *Pseudobranchus striatus* (Gray, *Brit Mus Cat—Batrachia*, 1st ed) This animal resembles *Siren* in most respects, but has only a single branchial aperture on each side, and only three digits to the anterior limb Its colour is dark-brown with a broad yellow band on each side and a narrower one inferiorly It occurs in Georgia, but seems to be very rare, there are two specimens in the Paris Musée, none in the British Museum

Figures of *Siren lacertina* are to be found in the following works—Cuvier in Humboldt's *Obs Zool*, i pl 11, Daudin, *Reptiles*, viii pl 49, Holbr, *N Amer Herp*, pl 34 *Pseudobranchus striatus* is figured in Duméril and Bibron, *Erpétologie Générale*, pl 96, Holbr, *loc cit*, pl 36, Leconte, *Ann Lyc N Y*, 1824, pl 4 (under name *Siren striata*)

SIREN, or SYREN See ACOUSTICS, vol i p 109

SIRENS, fabulous creatures of Greek mythology, that, like the Loreley of German legend, lured mariners to destruction by their sweet song In the *Odyssey* Ulysses sails past their island, but, warned by Circe, he had stopped the ears of his crew with wax and caused himself to be bound to the mast In Homer they are two in number, but in later writers they are generally three, and are located on the coast of Italy, near Sorrento and Capri, or on the Straits of Messina The tomb of one of them, Parthenope by name, was shown at Naples in Strabo's time A sanctuary of the Sirens stood on a headland near Sorrento According to Eratosthenes the Sirens were a three-headed rock separating the Bay of Naples from the Gulf of Salerno, but Strabo says they were three rocky islands on the southern side of the cape The cape itself (now Cape Campanella) was sometimes called the Cape of the Sirens When the Argonauts drew near the isle of the Sirens, Orpheus struck up and drowned their song According to Hyginus the Sirens were daughters of the river Achelous and the muse Melpomene, and because they had not rescued Proserpine from Pluto they were turned by Ceres into winged creatures, who were to live only so long as no one passed by them as they sang So, when Ulysses had eluded them, they flung themselves into the sea According to another story, they were

instigated by Hera to vie with the Muses in singing, the Muses were victorious, and plucked the feathers from the Sirens and made crowns for themselves out of them. In art they are usually represented with the bodies of women and the legs of birds, with or without wings. More rarely they appear as birds with only the heads of women. They seem to have had a funereal significance, and were often represented on tombs. For representations of them see J. E. Harrison, *Myths of the Odyssey*.

SIRICIUS, pope from December 384 till November 398, was the successor of Damasus and was himself succeeded by Anastasius I. See POPEDOM, vol. xix. p. 491.

SIRMÚR, one of the sub-Himalayan or Simla hill states under the government of the Punjab, lying between 30° 24′ and 31° N. lat. and between 77° 5′ and 77° 50′ E. long. Its area is 1096 square miles, and it is bounded on the N. by the hill states of Balsan and Jubal, on the E. by the British district of Dehra Dun, from which it is separated by the rivers Tons and Jumna, on the S.W. by Ambala district, and on the N.W. by the states of Patiála and Keunthál. Except a very small tract about Nahan, the chief town and residence of the raja, on the south-western extremity, where a few streams rise and flow south-westward to the Saraswati and Ghaggar rivers, the whole of Sirmúr lies in the basin of the Jumna, which receives from this tract the Giri and its feeders the Jalál and the Palúr. The Tons, the great western arm of the stream called lower down the Jumna, flows along the eastern boundary of Sirmúr, and on the right side receives from it the two small streams Minus and Naurai. The surface generally declines in elevation from north to south, the chief elevations on the northern frontier (Chor peak and station) are about 12,000 feet above the sea. The valley of the Khiárda Dún, which forms the southern part of the state, is bounded on the S. by the Siwalik range, the hills of which are of recent formation and abound in fossil remains of large vertebrate animals. Though the rocks of Sirmúr consist of formations usually metalliferous, the yield of mineral wealth is at present but small. The forests are very dense, so much so that the sportsman finds difficulty in making his way through them in search of wild elephants, tigers, leopards, bears, and hyænas, with which they abound. The climate of Sirmúr varies with the elevation, the northern extremity has very little rain, but large and excellent crops are everywhere to be obtained by irrigation.

The population in 1881 was 112,371 (males 63,305, females 49,066), the great majority being Hindus. The only town of any importance is Nahan, with a population of 5253. The principal products of the state are opium, tobacco, and cereals, and its gross revenue is estimated at £21,000. Sirmúr, which means "a crowned head," was the place of residence of the rajas who ruled over the state before the present dynasty entered the country. The reigning raja (Shamsher Prakásh, K.C.S.I.) holds his possessions by a grant made on the expulsion of the Gúrkhas by the British in 1815.

SIROHI, or SEEROHEE, a native state in the Rájputána agency under the Government of India, with an area of 3020 square miles, lying between 24° 20′ and 25° 20′ N. lat. and between 72° 10′ and 73° 10′ E. long., and bounded on the W. and N. by Márwár or Jodhpur, on the E. by Mewár or Udáipur, on the S. by Pálanpur and the Mahi Kántha states of Edar and Dánta. The country is much broken up by hills and rocky ranges, the Aravalli range divides it into two portions, running from north-east to south-west. The south and south east part of the territory is very mountainous and rugged, containing the lofty Mount Abu, an isolated mass of granite rock, culminating in a cluster of hills, enclosing several valleys surrounded by rocky ridges, like great hollows. The highest peak rises to 5653 feet above sea-level, and is one of the great trigonometrical stations. On both sides of the Aravallis the country is intersected with numerous water channels, which run with considerable force and volume during the height of the rainy season, but are dry for the greater part of the year. The only river of any importance is the Western Banás. A large portion of the state is covered with dense jungle, in which wild animals, including the tiger, bear, and leopard, abound. Many splendid ruins bear witness to the former prosperity and civilization of the state. The climate is on the whole dry, in the south and east there is usually a fair amount of rain. On Abu the average annual rainfall is about 64 inches, whereas in Erinpura, less than 50 miles to the north, the average fall is only between 12 and 13 inches. The Western Rajputána Railway runs through the length of the state, passing just east of Mount Abu.

In 1881 the population numbered 142,903 (males 76,132, females 66,771), of whom 123,633 were Hindus, 2935 were Mohammedans, and 16,137 were Jains. The town of Sirohi, the capital of the state, is situated at the western base of the range of hills north of Mount Abu, and its population (1881) numbered 5699. Wheat and barley are the staple crops, pulses and cotton are also grown. The present ruling family of Sirohi are Deora Rajputs, a branch of the great Chauhán clan, and are said to be immediately descended from Deo Raj, a descendant of Prithvi Raj, the Chauhán king of Delhi. During the early years of the present century Sirohi suffered much from wars with Jodhpur and the wild Miná hill tribes. The protection of the British was sought in 1817, the pretensions of Jodhpur to suzerainty over Sirohi were disallowed, and in 1823 a treaty was concluded with the British Government. For services rendered during the mutiny of 1857 the reigning "rao" received a remission of half his tribute.

SÍRSA, a British district in the lieutenant-governorship of the Punjab, lying between 29° 13′ and 30° 40′ N. lat. and between 73° 57′ and 75° 23′ E. long. It has an area of 3008 square miles, and is bounded on the N. by Firozpur district and the native state of Patiála, on the W. by the river Sutlej, on the S.W. by the native states of Baháwalpur and Bíkaner, and on the E. by Hissar district. Lying as it does between the barren deserts of Bíkaner and the comparatively fertile though sandy plains of the Cis-Sutlej states, Sírsa district in soil as well as position forms an intermediate link between the two. It forms for the most part a bare and treeless plateau stretching from the valley of the little river Ghaggar on the east to the main stream of the Sutlej on its western border. In the immediate neighbourhood of the Sutlej, however, is a fertile alluvial tract (*khádar*), intersected by numerous branches of the river, and flooded by their outflow during the rainy season. Eastward of the khádar lies the sandy central tableland, which is chiefly employed for purposes of pasturage. East of this plateau is the valley of the Ghaggar, a formidable torrent in the rainy months, but so entirely dependent on the rainfall of the lower Himalayas that it is usually dry from October to July. The Ghaggar expands into three jhils or marshy lakes, the largest of which is 5 miles in length by 2 in breadth. South of the Ghaggar spreads a sandy tract beyond the reach of its fertilizing influence, and of small agricultural value. Formerly the district was covered by an excellent grazing grass, known as *dháman*, but with the increase of cultivation it is fast disappearing. The climate of Sírsa is extremely dry, the average annual rainfall reaching only 15 inches. The Rewari-Ferozepore Railway passes through the district from south to north.

The population of the district, according to the census of 1881, was 253,275 (males 138,691, females 114,584), of whom 130,582 were Hindus, 93,289 Mohammedans, and 28,303 Sikhs. The only town with a population exceeding 10,000 is Sírsa, the administrative headquarters of the district, with 12,292 inhabitants. The modern town of Sírsa was founded in 1837, and the ruins of old Sírsa lie near its south west corner. It is a considerable entrepôt for the trade of the wheat-growing countries to the north and east with Bíkaner and Márwár. At the opening of the present century nearly the whole of Sírsa district was a barren almost uncultivated waste. Gradually, however, with more peaceful times

cultivation has again extended. Of the total area 1353 square miles are now cultivated and 1548 square miles are cultivable. The staple product is bajra, which in 1882–83 occupied 546,905 acres, the other principal crops are joar, barley, and wheat. The district has little trade except in agricultural produce, which goes chiefly to Bíkaner, and the only manufacture of any importance is that of *sajji*, an impure carbonate of soda, used in washing and dyeing cloth. Sirsa was officially included in the territory conquered from the Mahrattas in 1803, when it was almost entirely uninhabited. It required re-conquering from the Bhattis in 1818, but it did not come under British administration until 1837. During the mutiny of 1857 Sirsa was for a time wholly lost to British rule. On the restoration of order the district was administered by Punjab officials, and in the following year, with the remainder of the Delhi territory, it was formally annexed to that province.

SISKIN (Dan. *Sidsken*, Germ. *Zeisig* and *Zeising*), long known in England as a cage-bird, since, in 1544, Turner mentioned it in that character under this name,[1] and said that he had only once met with it at large—the *Fringilla spinus* of Linnæus, and *Carduelis* or *Chrysomitris spinus* of modern writers. In some of its structural characters it is most nearly allied to the GOLDFINCH (vol. x. p. 758), and both are often placed in the same genus by systematists, but in its style of coloration, and still more in its habits, it resembles the Redpolls (*cf.* LINNET, vol. xiv. p. 675), though without their slender figure, being indeed rather short and stout of build. Yet it hardly yields to them in activity or in the grace of its actions, as it seeks its food from the catkins of the alder or birch, regardless of the attitude it assumes while so doing. Of an olive-green above, deeply tinted in some parts with black and in others lightened by yellow, and beneath of a yellowish-white again marked with black, the male of this species has at least a becoming if not a brilliant garb, and possesses a song that is not unmelodious, though the resemblance of some of its notes to the running-down of a piece of clockwork is more remarkable than pleasing. The hen is still more soberly attired, but it is perhaps the Siskin's disposition to familiarity that makes it so favourite a captive, and, though as a cage-bird it is not ordinarily long-lived, it readily adapts itself to the loss of liberty. Moreover, if anything like the needful accommodation be afforded, it will build a nest and therein lay its eggs, but it rarely succeeds in bringing up its young in confinement. As a wild bird it breeds constantly, though locally, throughout the greater part of Scotland, and has frequently done so in England, but more rarely in Ireland. The greater portion, however, of the numerous bands which visit the British Islands in autumn and winter doubtless come from the Continent—perhaps even from far to the eastward, since its range stretches across Asia to Japan, in which country it is as favourite a cage-bird as with us. The nest of the Siskin is very like that of the Goldfinch, but seldom so neatly built, the eggs, except in their smaller size, much resemble those of the GREENFINCH (vol. xi. p. 165).

A larger and more brightly coloured species, *C. spinoides*, inhabits the Himalayas, but the Siskin has many other relatives belonging to the New World, and in them serious modifications of structure, especially in the form of the bill, occur. Some of these relatives lead almost insensibly to the GREENFINCH (*ut supra*) and its allies, others to the GOLDFINCH (*ut supra*), the Redpolls, and so on. Thus the Siskin perhaps may be regarded as one of the less modified descendants of a stock whence such forms as those just mentioned have sprung. Its striated plumage also favours this view, as an evidence of permanent immaturity or generalization of form, since striped feathers are so often the earliest clothing of many of these birds, which only get rid of them at their first moult. On this theory the Yellowbird or North-American "Goldfinch," *C. tristis*, would seem, with its immediate allies, to rank among the highest forms of the group, and the Pine-Goldfinch, *C. pinus*, of the same country, to be one of the lowest,—the cock of the former being generally of a bright jonquil hue, with black crown, tail, and wings—the last conspicuously barred with white, while neither hens nor young exhibit any striations. On the other hand, neither sex of the latter at any age puts off its striped garb—the mark, it may be pretty safely asserted, of an inferior stage of development. The remaining species of the group, mostly South-American, do not seem here to need particular notice. (A. N.)

[1] It is also called by bird-fanciers "Abadavine" or "Aberdevine"—names of which the etymology is wholly unknown.

SISMONDI, JEAN CHARLES LEONARD DE (1773–1842), whose real name was SIMONDE, was born at Geneva on May 9, 1773. His father and all his ancestors seem to have borne the name Simonde, at least from the time when they migrated from Dauphiné to Switzerland at the revocation of the edict of Nantes. It was not till after Sismondi had become an author that, observing the identity of his family arms with those of the once flourishing Italian house of the Sismondi, and finding that some members of that house had migrated to France, he assumed the connexion without further proof and called himself De Sismondi. The Simondes, however, were themselves citizens of Geneva of the upper class, and possessed both rank and property, though the father was also a village pastor. The future historian was well educated, but his family wished him to devote himself to commerce rather than literature, and he became a banker's clerk at Lyons. Then the Revolution broke out, and as it affected Geneva the Simonde family took refuge in England, where they stayed for eighteen months. Disliking it is said, the climate, they returned to Geneva, but found the state of affairs still unfavourable, there is even a legend that the head of the family was reduced to sell milk himself in the town. The greater part of the family property was sold, and with the proceeds they emigrated to Italy, bought a small farm at Pescia near Lucca, and set to work to cultivate it themselves. Sismondi worked hard here, both with his hands and his mind, and his experiences gave him the material of his first book, *Tableau de l'Agriculture Toscane*, which, after returning to Geneva, he published there in 1801. Two years later he published his *Traité de la Richesse Commerciale*, his first work on the subject of political economy, which, with some differences of view, continued to interest him to the end of his life (for his position and work in this respect the reader is referred to the article POLITICAL ECONOMY, vol. xix. p. 383). Meanwhile he began his great *History of the Italian Republics*, and was introduced to Madame de Stael. With her he became very intimate, and after being regularly enrolled in the society of Coppet he was invited or commanded (for Madame de Stael's invitations had something of command) to form one of the suite with which the future Corinne made the journey into Italy, resulting in *Corinne* itself during the years 1804–5. Sismondi was not altogether at his ease here, and he particularly disliked Schlegel, who was also of the company. But during this journey he made the acquaintance of the countess of Albany, Louisa of Stolberg, widow of Charles Edward, and all her life long gifted with a singular faculty of attracting the affection (Platonic and other) of men of letters. She was now an old woman, and Sismondi's relations with her were of the strictly friendly character, but they were close and lasted long, and they produced much valuable and interesting correspondence. In 1807 appeared the first volumes of the above mentioned book on the Italian republics, which (though his essay in political economy had brought him some reputation and the offer of a Russian professorship) first made Sismondi prominent among European men of letters. The completion of this book, which extended to sixteen volumes, occupied him, though by no means entirely, for the next eleven years. He lived at first at Geneva, and delivered there some interesting lectures on the literature of the south of Europe, which were continued from time to time and finally published, and he held an official post,—that of secretary of the chamber of commerce for the then

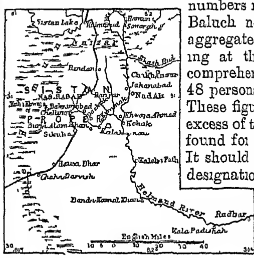
department of the Leman In 1813 he visited Paris for the first time and abode there for some years, mixing much in literary society Although a Liberal and in his earlier days almost an Anglomaniac, he did not welcome the fall of the empire During the Hundred Days he defended Napoleon's constitutional schemes or promises, and had an interview with the emperor himself which is one of the chief events of a not very eventful life After the Restoration he left Paris On completing his great book on the Italian republics he undertook a still greater, the *Histoire des Français*, which he planned on a vast scale, and of which during the remaining twenty-three years of his life he published twenty-nine volumes His untiring industry enabled him to compile many other books, but it is on these two that his fame chiefly rests The earlier displays his qualities in the most favourable light, and has been least injuriously affected by subsequent writings and investigations The *Histoire des Français*, as a careful and accurate sketch on the great scale, has been entirely superseded by that of M Henri Martin, while it is not to be mentioned, as a work of historical or literary genius, in the same category with that of Michelet Sainte-Beuve has with benevolent sarcasm surnamed the author "the Rollin of French History," and the praise and the blame implied in the comparison are both perfectly well deserved In April 1819 Sismondi married an English lady, Miss Allen, whose sister was the wife of Sir James Mackintosh and the marriage appears to have been a very happy one His later years were chiefly spent at Geneva, in the politics of which city he took a great, though as time and changes went on a more and more chagrined, interest Indeed, in his later days he became a kind of reactionary He died at Geneva on June 25, 1842 Besides the works above mentioned he had executed many others, his custom for a long period of years being never to work less than eight hours a day The chief of these are *Nouveaux Principes d'Économie Politique* (1819), an historical novel entitled *Julia Severa ou l'An 492* (1822), *Histoire de la Renaissance de la Liberté en Italie* (1832), *Histoire de la Chute de l'Empire Romain* (1835), *Précis de l'Histoire des Français*, an abridgment of his own book (1839), with several others, chiefly political pamphlets

Sismondi's literary character has been hinted at in the above remarks on his French history He was exceedingly laborious, for the most part (though not entirely) free from prejudice, and never violent even when he was prejudiced He had (with much "sensibility") plenty of common sense, though not perhaps any extraordinary amount of acuteness in estimating things uncommon, and he was a little deficient in historical grasp and in the power of taking large views of complicated series of events His style corresponded to his thought, and (putting aside certain solecisms which French critics usually affect to discover in Swiss writers) lacks point, picturesqueness, and vigour Of his moral character no one has ever spoken except in terms of praise, and it appears (which is not invariably the case) to have been as attractive as it was estimable His chief weakness seems to have been a tendency, frequently observable in writers of very great industry, to rank his own productions somewhat too much on a level with those of writers who, if less industrious, were infinitely more gifted Thus he has somewhere naively observed that "he should not object to signing" a certain proportion of a certain book of Chateaubriand's But this overvaluation of self appears to have been merely *naïf*, and not in the least arrogant

Sismondi's journals and his correspondence with Channing, with the countess of Albany, and others have been published chiefly by Mlle Mongolfier (Paris, 1863) and M de Saint-René Taillandier The latter work serves as the chief text of two admirable *Lundis* of Sainte-Beuve (September 1863), republished in the *Nouveaux Lundis*, vol vi

SISTÁN, or SEISTAN (SEJISTÁN), the ancient *Sacastane* (*Çakasthâna*, "land of the Sacæ") and the *Nimrúz* or "meridies" of the *Vendidad*, is situated generally between 30° 0′ and 31° 35′ N lat and 61° 0′ and (including Rudbár) 62° 40′ E. long Its extreme length is about 100 and its breadth varies from 70 to over 100 miles,—but the exact limits are vague, and the modern signification of the name practically comprehends the peninsula formed by the lower Helmand and its embouchure on the one side and the "Hamún" or "lake" on the other When British arbitration was brought to bear upon the disputed claims of Persia over this country in 1872, it was found necessary to suppose two territories—one compact and concentrated, which was called "Sistán Proper," the other detached and irregular, called "Outer Sistán" Of each of these a brief description will be given

1 Sistan Proper is bounded on the north by the "Naizár," or reed-bed which fringes the "Hámún" or expanse, west by the Hámún itself, of which the hill called "Kuh-i-Khwájah" marks the central point, south by a line shutting in Sikuha and all villages and lands watered by the main Sistán Canal, and east by the old bed of the Helmand, from a mile above the dam at Kohak to the mouth Kal'ah-i-nau and Rindan are among the more northerly inhabited villages The Kuh-i-Khwájah is a sufficient indication of the western side Búrj-i-'Alam Khan should be included within the southern boundary as well as Sikuha Khwájah Ahmad and Jahánabád, villages on the left bank, or west of the true bed of the Helmand, denote the eastern line The whole area is estimated at 947 square miles The fixed population may be roughly stated at 35,000,—some 20,000 Sistánis and 15,000 settlers,—the greater part of whom are Parsiwans, or rather, perhaps, a Persian-speaking people To the above numbers may be added 10,000 Baluch nomads Taking the aggregate at 45,000, and looking at the extent of country comprehended, we find nearly 48 persons to the square mile These figures are eight times in excess of the proportional result found for the whole of Persia It should be explained that the designation Sistán Proper is not arbitrarily given The territory comprehended in it is spoken of as Sistán by the dwellers on the right bank of the Helmand, in contradistinction to their own lands At the same time it could only be but a fractional part—as indeed the whole country under consideration could only be—of the Sistán of Persian history



Map of Sistán

Sistán Proper is an extensive tract of sand and clay alluvium, generally flat, but irregular in detail It has heaps, but no hills, bushes, but no trees, unless indeed three or four tamarisks of aspiring height deserve the name, many old ruins and vestiges of comparative civilization, but few monuments or relics of antiquity It is well watered by rivers and canals, and its soil is of proved fertility Wheat or barley is perhaps the staple cultivation, but pease, beans, oil-seeds, and cotton are also grown Among fruits, grapes and mulberries are rare, but melons and water-melons, especially the latter, are abundant Grazing and fodder are not wanting, and besides the reeds peculiar to Sistán there are two grasses which merit notice,—that called *bannu*, with which the bed of the Hamún abounds on the south, and the taller and less salt *kirta* on the higher ground

2 Outer Sistán, the country on the right bank of the Helmand, and east of its embouchure in the Hámún, extends more than 100 miles in length, or from a point between the Charboli and Khuspas rivers north to Rudbár south In breadth the district of Chakhansúr, measuring from the old bed of the Helmand, inclusive of Nad Ali, to Kadah, may be estimated at some 30 miles It

produces wheat and barley, melons, and perhaps a few vegetables and oil seeds Beyond the Chakhansúr limits, southward or up to the Helmand, there is probably no cultivation save that obtained on the river bank, and ordinarily illustrated by patches of wheat and barley with melon beds On the opposite side of the river, in addition to the cultivated portions of the bank, there is a large tract extending from above (*i e*, south of) Kohak, or the Sistán dam (*band*), to the gravelly soil below the mountain ranges which separate Sistán from Baluchistan and Narmashir The distance from north to south of this plain may be computed at 40 miles, and from east to west at 80 or 90 miles Lands north of the Názái not belonging to the Afghan district of Lash Juwain may also be included in Outer Sistan, but it is unnecessary to make any distinction of the kind for the tract marked "Hámún" on the west, where it merges into the Persian frontier Bellew states there are 1200 houses in Chakhansúr This can hardly apply to the fort in which the sardar lives, and the comparatively few houses outside, bearing that name, and noticed by Major Lovett on his visit in 1872 Nor did there then appear to be any other centres of population in the district, excepting perhaps Kadah on the eastern limit The inhabitants are Sistánis or Parsiwans, Baluch nomads, and Afghans Between the Kohak *band* and Rudbár they are mainly Baluch Most of the less nomad tribesmen are Sanjuráni and Toki, the sardars jealously claiming the former appellation

The most remarkable geographical feature of Sistán generally, in the modern acceptation of the term, is the Hámún, or expanse, which stretches far and wide on the north, west, and south, but is for a great part of the year dry or a mere swamp In the early spring, at which period the present writer was in the locality, the existence of a lake could only be certified by pools or hollows of water formed at the mouths of the principal feeders, such as the Khash Rúd on the north east, the Farah Rud on the north-west, and the Helmand, where its old bed terminates at no great distance from the Khash Rúd Bellew describes the aspect of that portion of Sistán limited to the actual basin of the Helmand as indicating the former existence of a lake which covered with its waters a considerable area On the north this tract has been raised to a higher level than the remainder by the deposit at the mouths of rivers of the solid matter brought down It is still, however, from 200 to 500 feet below the level of the desert cliffs that bound it, and which at some former period formed the shores of the lake, and it is from 50 or 60 to 200 feet above the level of the beds of the rivers now flowing into the existing Hámún The tract thus raised by depositions in the bed of the former lake, writes the same authority, is now the inhabited district of Sistán, and contains the Hámún, a great sedge-grown swamp, the last relic of the lake itself To the south of the Hámún and inhabited tract of Sistán is the Zarah hollow It extends for about 100 miles to the Sarhad Mountains Called by the natives God-i Zarah, or the hollow of Zarah, it is described as a wide and circular depression sloping gently up to the bounding hills and desert cliffs It receives the drainage of these in its central and deepest hollow, which, except in seasons of drought, is more or less marshy It is connected along the western border of the area with the existing Hámún by the Sar-shila, a great drainage gully through which runs the superfluous flood of the Hámún

The water-supply of Sistán is about as uncertain as that of Sind, though the general inclination to one bank, the left, is more marked in the Helmand than in the Indus Therefore the boundary lines given must be received with slight reservation It is easy to see that a good year of inundation extends the borders of the so-called lake to within the Názái, and there are well defined beds of dry canals intersecting the country, which prove the existence formerly of an extensive water-system no longer prevailing The main canal of Sistán, confounded by some writers with the parent river, bears the waters of the Helmand westward into the heart of the country They are diverted by means of a large *band* or dam, known indifferently as the "Amir's," the "Sistán," or the "Kohak" *band* It is constructed of horizontally laid tamarisk branches, earth, and perpendicular stakes, and protected from damage by a fort on the left and a tower on the right bank of the river Although this diversion of the stream may be an artificial development of a natural channel, and undoubtedly dates from a period long prior to recent Persian occupation, it appears that the later arrangements have been more maturely and better organized than those carried on by the predecessors of the amír of Káian The towns of Deshtak, Chelling, Burj-i 'Alam Khan, Bahramabad, Kimmak, and others of less note are actually on the banks of this main canal Moreover, it is the indirect means of supplying water to almost every town and village in Sistan Proper, feeding as it does a network of minor canals, by which a system of profuse irrigation is put in force, which, with an industrious and a contented population, should be productive of most extensive grain cultivation To consider the main canal as the river itself is a theory which a brief inspection of the locality seems quite to disprove On the one hand we have a comparatively narrow passage abruptly turning to the westward, on the other a broad and well defined river bed prolonged in the old direction, into which the waters would at all times flow unrestrained but for an artificial embankment Whatever arguments, however, may be used on this head, the larger bed is assumed to be the original Helmand for purposes of territorial limitation

Provisions in Sistán are, as a rule, sufficient, though sheep and oxen are somewhat poor Bread is cheap and good, being procurable to natives at less than a halfpenny the pound Vegetables are scarce, and rice is chiefly obtained from Herat The inundated lands abound with water-fowl Partridges and sand grouse are occasionally seen River fish are plentiful enough, but confined to one species, the barbel

The inhabitants of Sistán are mainly composed of Kaiyánis, descendants of the ancient rulers of the land, Sarbandis and Shahrakis, tribes supposed to have consisted originally of immigrants from western Persia, and Baluchis of the Nharui and Sanjurani (Toki) clans Bellew separates the "Sistánis", but it is a question whether this term is not in a large measure applied to fixed inhabitants of the country, whatever their descent and nationality For instance, an old Shahraki guide to the Sistan Mission of 1872 persisted in being a "Sistani", and, if his definition be accepted, the outside element must be confined to Baluchis and modern settlers only

History.—The ancient Drangiana (Zaraya, Daraŭka, "lake land") received the name of "land of the Sacæ" after this country was permanently occupied by the "Scythians" or Sacæ, who overran Iran in 128 B C (see PERSIA, vol xviii pp 594 *sq*) It was included in the Sásánian empire, and then in the empire of the caliphs About 860 A D, when it had undergone many changes of government under lieutenants of the Baghdad caliphs, or bold adventurers acting on their own account, Ya'kúb b Láith made it the seat of his power In 901 it fell under the power of the Sámánids, and a century later into that of the Ghaznavids An invasion of Jaghatais and the irruption into its richer lands by Timúr are salient points in the history of Sistán prior to the Safawid conquest (1508) Under this dynasty for more than two centuries, or up to 1722, Sistan remained more or less a Persian dependency At the time of the Afghan invasion of Mir Mahmúd (1722), Malik Muhammad Kaiyáni was the resident ruler in Sistán, and by league with the invader or other intrigue he secured for himself that particular principality and a great part of Khurasan also He was slain by Nadir Kuli Khan, the general of Shah Tahmasp, who afterwards, as Nadir Shah, became possessor of Sistán as part of his Persian dominions Shortly after the death of Nadir (1751) Sistán passed, together with other provinces, into the hands of Ahmad Shah Abdali, the first sovereign in a united Afghanistan On the death of Ahmad Shah in 1773 the country became a recognized bone of contention, not so much between Persians and Afghans as between Herat and Kandahar, but eventually the internal dissensions of Afghanistan gave Persia the desired opportunity, and by a steady course of intrigue and encroachment she managed to get within her grasp the better lands on the left bank of the lower Helmand and something on the right bank besides When the British arbitrator appeared on the scene in the beginning of 1872, though compelled to admit the shah's possession of what has been called "Sistán Proper," he could in fairness insist on the evacuation of Nad Ali, Kala Fath, and all places occupied on the right bank by Persian troops, and furthermore he left to the Afghans both sides of the river Helmand from the dam of Kohak to its elbow west of Rudbár For the precise boundary see PERSIA, vol xviii p 619

See *Eastern Persia*, vol i, Bellew's *Record of Sistan Mission*, *Journal of R Geog Society*, vol xliii (1873) (F J G)

SISTOVA, a town of Bulgaria, at the head of a district of its own name (40,893 inhabitants in 1881), is situated on the right bank of the Danube, about 40 miles above Rustchuk, and has rather a picturesque appearance on the slopes of the Kadbair and the Chuka On the latter hill there stood till the fire of 1810 a mediæval fortress, and previous to the 15th century it contained a Latin church of traditional celebrity The lower town along the river consists of modern houses, mostly erected since 1870, and is the scene of busy commercial life, especially during the

grain-export season. The principal church, completed in 1867, is a large and costly building with an imposing dome. Sistova was one of the first of the Bulgarian towns to introduce the national language into its schools (1833), some of which are now well endowed and flourishing. More than half the inhabitants, who numbered 11,560 in 1881, are Bulgarians, the rest being Turks, Walachians, and Gipsies.

Sistova is identified with the old Roman colony *Novæ* mentioned by Ptolemy and others. The exact site appears to have been Staklen, a cluster of vineyards with remains of ancient buildings to the west of the present town, which has gradually moved eastward since the 16th century, when it was reduced by the Turkish wars to a miserable village. It was at Sistova that the peace of 1790 was signed, by which the Austrian Turkish boundary was determined. The town was burned in 1810 by the Russian general Saint Priest, but subsequent to 1820 it began to revive, and the introduction of steam traffic on the lower Danube (1835) restored its prosperity in spite of the effects of the Russian war of 1828–29, when the Walachian town of Alexandria was founded by fugitives from Sistova. In 1877 the Russians entered Bulgaria by passing the river just below Sistova.

SISTRUM, a kind of rattle used by the ancient Egyptians in religious ceremonies, especially in the worship of Isis. It consisted of a frame through which passed four rods, attached to the frame was a handle. When shaken the rods rattled and produced the sound. After the introduction of Egyptian worships into Italy the Romans became familiar with the sistrum. It is described by Apuleius (*Metam*, xi 4). An ancient sistrum formerly existed in the library of Ste Geneviève at Paris. In paintings found at Portici a priest of Isis and a woman are represented rattling the sistrum. The instrument is said to be still in use in Nubia and Abyssinia.

SISYPHUS, a famous character of Greek mythology, was a son of Æolus and Enarete and brother of Cretheus, Athamas, and Salmoneus. He built Ephyra (Corinth), and married Merope, daughter of Atlas, by whom he had a son Glaucus. According to Pausanias (ii 3, 11) Sisyphus succeeded Medea in the sovereignty of Corinth. Having found the body of the drowned Melicertes lying on the shore of the isthmus, Sisyphus buried him and instituted in his honour the Isthmian games. From Homer onwards Sisyphus was famed as the craftiest of men. His name (formed by reduplication from the same root as σοφός) means the Wise, Wise One. When Death came to fetch him, Sisyphus put him into fetters, so that no one died till Ares came and freed Death, and delivered Sisyphus into his custody. But Sisyphus was not yet at the end of his resources. For before he died he told his wife that when he was gone she was not to offer the usual sacrifice to the dead. So in the under world he complained that his wife was neglecting her duty, and he persuaded Hades to allow him to go back to the upper world and expostulate with her. But when he got back to Corinth he positively refused to return to Deadland, so he lived to a good old age, and even then Hermes had a tough job to carry him off. In the under world Sisyphus was compelled to roll a big stone up a steep hill, but before it reached the top of the hill the stone always rolled down, and Sisyphus had to begin all over again. The subject was a commonplace of ancient writers, and was depicted by the painter Polygnotus on the Lesche at Delphi.

The way in which Sisyphus cheated Death is a common incident in folk-tales. Thus in a Venetian story the ingenious Beppo ties up Death in a bag and keeps him there for eighteen months; there is general rejoicing, nobody dies, and the doctors are in high feather. In a Sicilian story an innkeeper corks up Death in a bottle, so nobody dies for years, and the long white beards are a sight to see. In another Sicilian story a monk keeps Death in his pouch for forty years. (See Crane, *Popular Italian Tales*, Nos 63, 64, 65, 66, with the translator's notes.) The German parallel is Gambling Hansel, who kept Death up a tree for seven years, during which no one died (Grimm, *Household Tales*, No 82, in his notes Grimm cites a number of German parallels). The Norse parallel is the tale of the Master Smith (Asbjornsen og Moe, *Norske Folke-Eventyr*, 21, Dasent, *Popular Tales from the Norse*, p 106). For a Lithuanian parallel, see Schleicher, *Litauische Märchen, Sprichwörte, Rätsel und Lieder*, p 108 *sq*), for Slavonic parallels, Krauss, *Sagen und Märchen der Sudslaven*, ii, Nos 125, 126.

SITÁPUR, a British district in Sitápur division or commissionership of Oudh, under the jurisdiction of the lieutenant-governorship of the North-Western Provinces of India. It lies between 27° 7′ and 27° 53′ N lat and between 80° 21′ and 81° 26′ E long, and it is bounded on the N by Kheri district, on the E by that of Bahraich, from which it is separated by the Gogra river, and on the S and W by Bara Banki, Lucknow and Hardoi districts, the Gumti river forming the boundary. Sitápur district is elliptical in shape, its greatest length from south-east to north-west is 70 miles, and its extreme breadth from north-east to south-west 55 miles, its area is 2251 square miles. Being without hills or valleys, and devoid of forests, Sitápur presents the appearance of a vast plain sloping imperceptibly from an elevation of 505 feet above sea-level in the north-west to 400 feet in the south-east. The country is, however, well wooded with numerous groves, and well cultivated, except in those parts where the soil is barren and cut up by ravines. It is intersected by numerous streams, and contains many shallow ponds and natural reservoirs, which overflow during the rains, but become dry in the hot season. Except in the eastern portion, which lies in the doabs or alluvial plains between the Kewáni and Chauka and the Gogra and Chauka rivers, the soil is as a rule dry, but even this moist tract is interspersed with patches of land covered with saline efflorescence called "reh". The principal rivers are the Gogra, which is navigable by boats of large tonnage throughout the year, and the Chauka. Nylghau, many varieties of deer, wild hog, wolf, jackal, and fox are common, but none of the larger wild animals are found within the district. The climate is considered healthy, and the cantonments of Sitápur are famous for the low mortality of the British troops stationed there. The average annual rainfall is about 33 inches. The district contains no railway, but it is well provided with good unmetalled roads.

In 1881 the population was returned at 958,251 (505,986 males and 452,265 females), Hindus numbered 818,738, Mohammedans 138,733, and Christians 413. Sitápur contains but two towns with more than 10,000 inhabitants,—namely, Khairabad, 14,217, and Laharpur, 10,437. The administrative headquarters of the district are at Sitápur town, which is prettily situated on the banks of the Saráyan river, with good groves in all directions, and with a population in 1881 of 6780. Of the total district area 1455 square miles are cultivated and 510 are cultivable. The principal staples are wheat, barley, joar, gram, bajra, and rice, besides these a considerable quantity of sugar-cane is raised, as also oil seeds, cotton, and tobacco. The only manufactures of any note are tobacco and tazias at Biswan, with a little cotton printing and weaving in most of the towns. The history of Sitápur is closely associated with that of the rest of Oudh. The district figured prominently in the mutiny of 1857, when the native troops quartered in the cantonments rose in mutiny and fired on their officers, many of whom were killed, as were also several military and civil officers, with their families, in attempting to escape. Order being restored in 1858, the Government offices were re-opened, and nothing has since occurred to disturb the peace of the district.

SITTINGBOURNE, an ancient town of Kent, is situated on a navigable creek of the Swale, and on the London, Chatham, and Dover Railway, at the junction for Sheerness, 7 miles south from the latter town and 45 east-south-east of London. It consists principally of one long street and the northern suburb of Milton, formerly celebrated for its oysters, the fishery of which used to employ a large number of the inhabitants. Brickmaking is a very important industry, and there are large paper-

mills. St Michael's church, in the Early English and later styles, underwent extensive restoration in 1873 at a cost of nearly £3000. The principal other public buildings are the old town-hall, the corn exchange (erected 1859), and the museum. Public gardens 10 acres in extent have recently been laid out. The local government board was instituted in 1878. The population of the urban sanitary district (area 1004 acres) in 1871 was 6148 and in 1881 it was 7856.

Sittingbourne, or Sedyngburne, received a grant of a market and two annual fairs by a charter of Queen Elizabeth. The style "guardian and free tenants," applied to the corporation in this charter, was subsequently changed to that of "mayor and jurats." See W. A. Scott Robertson, *Sittingbourne and the Names of Lands and Houses in or near it*, Sittingbourne, 1879.

SIÚT, or Asyút (Asioot), more correctly Osyút, a town of Upper Egypt, and southern terminus of the railway on the left bank of the Nile, by which it is 229 miles from Bulák Dakrúr. The population is about 25,000. See Egypt, vol. vii. p. 775.

SIVA. See Brahmanism.

SIVÁS, or Siwás, a pashalic and capital of a pashalic of great importance in Asia Minor. The town is situated on the right bank of the Kizil Irmak (Halys), in a plain of some 16 to 20 miles in length and 4 to 6 in breadth. From the south the approach is by a good road among the mountains, and the aspect from the heights is pleasing. Dotted here and there with trees, some in large extended clusters, the houses and citadel cover a considerable space and appear much scattered. On the north a military road has been constructed to facilitate communication with the coast. Sívás is 4670 feet above the level of the Black Sea, and should be a healthy residence for Europeans. The population, estimated on the spot in 1864 at 10,000 houses, more than a fifth being Armenians, is stated in Murray's *Handbook* of 1878 to consist of 5000 Turkish and 1200 Armenian families. There are some respectable residences but not many buildings or monuments of note, and the streets are narrow and ill-maintained. The bazaars are fairly stocked with goods, British as well as of other European nations.

Sívás is the ancient *Sebasteia* (not to be confounded with Sebaste or Cabira on the Lycus, the modern Niksar), the capital of Armenia II., and the seat of an archbishop. In 1021 it was ceded by the emperor Basil to the Armenian king, Senekharim. It again became Greek in 1080, but soon after fell to the Seljúks. In the 13th century Marco Polo speaks of Sevaste as the place "where the glorious Messer Saint Blaise suffered martyrdom." It was, when he wrote, in the possession of the Turkmáns of Karamania, living under the government of the Seljúk princes. In the 14th century we have the testimony of Ibn Batuta, who says (ii. 289):—"It is one of the possessions of the king of Irak, and the largest town owned by him in the country. His chiefs and his collectors reside there. It is well-built, and has wide streets and crowded markets." Colonel Goldsmid visited Sívás in July 1864, and was shown some fine monuments described as the mausolea of the Seljúks, the inscriptions on which he found to date no earlier than 670 of the Hijra, though the actual tombs might be traceable to a former period.

SIXTUS I. (Xystus) figures in the lists accepted by the Roman Church as having been bishop of Rome from about 119 to about 126. He is conjectured to have been a presbyter and a martyr.

SIXTUS II. followed Stephanus I. as bishop of Rome in 257, and suffered martyrdom under Valerian in the following year. He restored the relations with the African and Eastern Churches which had been broken off by his predecessor on the question of heretical baptism. Dionysius succeeded him.

SIXTUS III., bishop of Rome from July 31, 432, to August 18, 440, had Cœlestinus I. as his predecessor, and was succeeded by Leo I.

SIXTUS IV. (Francesco della Rovere), pope from 1471 to 1484, was born 21st July 1414, near Savona. The statements respecting his parents' situation in life are very conflicting. In consequence of a vow made by his mother he entered the Franciscan order at an early age, and speedily acquired a great reputation for eloquence and learning. After filling several minor offices he became general of his order, and in 1467 was to his own surprise made cardinal by Paul II., at the recommendation, it is asserted, of Cardinal Bessarion. When, upon Paul's death in 1471, the rigour of Bessarion's principles prevented his profiting by the favourable sentiments of influential cardinals, who, nevertheless, expected to be recompensed for their suffrages, Rovere seems to have been found more accommodating. The liberality of his donations after his election, at all events, raised suspicion; but the friendship of Bessarion has also been enumerated among the causes of the sudden elevation of the most recent member of the Sacred College. He was elected on 9th August 1471, and immediately proceeded to lavish Paul's treasures—partly in laudable preparations against the Turks, partly in embassies, receptions of foreign princes, public improvements, and other expenses possibly imprudent, but at least not indecorous; partly, without any excuse, upon his unworthy nephews, Count and Cardinal Riario. The prodigalities of the latter surpassed all measure, and he compromised his uncle much more seriously by his complicity in the conspiracy of the Pazzi, aiming at the assassination of the Medici family. Sixtus was cognizant of the plot, but had positively forbidden the shedding of blood, which he must nevertheless have known to be inevitable. He deserves still more censure for entering into a fruitless and inglorious war with Florence, which terminated in 1480, after having kept Italy for two years in confusion. Scarcely was it over when he allowed himself to be involved in yet more troublesome and discreditable contests,—first inciting the Venetians to attack Ferrara, and then, after having been delivered by their general Roberto Malatesta from a Neapolitan invasion, turning round upon them and eventually assailing them on their refusal to desist from the hostilities which he had himself instigated. He relied on the co-operation of Lodovico Sforza, who speedily forsook him; and the scandal was witnessed of the secular princes and cities of Italy agreeing to a peace which the Father of Christendom did his best to thwart, and vexation at which was believed to have hastened his death. He died, at all events, a few days afterwards, 13th August 1484, leaving an unfortunate reputation as the first pope who brought nepotism into politics, and, not content with enriching his relatives by gifts and lucrative offices, made their aggrandizement the principal object of his policy as a secular prince. His private character was nevertheless estimable: he was pious, of blameless morals, hospitable and munificent to a fault, and so exempt from avarice, says his secretary Conti, that he could not endure the sight of money. His faults were those of a monk who had no natural outlet for strong affections except unworthy relatives, and who had been called from a cloister to fill the most conspicuous position in the world. His secular policy was capricious and spasmodic; he neither maintained the peace of Italy like his predecessor and successor nor carried out a consistent and well considered scheme of conquest like Alexander VI. He was, notwithstanding, always firm in his resistance to the Turks, and showed magnanimity by aiding his enemy the king of Naples against the common foe of Christendom. The brilliant side of his administration was his munificence as a founder or restorer of useful institutions and a patron of letters and art. He established and richly endowed the first foundling hospital, built and repaired numerous churches, constructed the Sixtine Chapel and the Sixtine Bridge, commissioned paintings on the largest scale, pensioned and

rewarded men of learning, and, above all, immortalized himself as the second founder of the Vatican library. It has been said that the stones alone inscribed with his name would serve to erect a considerable edifice. These great works, however, were not accomplished without grievous taxation and questionable methods of raising money; and Sixtus's successor expressed the general condemnation of his government when he declared that he for his part would imitate the example of Paul II. Sixtus was succeeded by Innocent VIII. (R. G.)

SIXTUS V. (Felice Peretti), pope from 1585 to 1590, was born 13th December 1521 at Grottamarina, in the district of Fermo, of a family said to be of Dalmatian extraction. His parents were undoubtedly in humble circumstances, but the story of his having been a swineherd in his youth seems to be a mere legend. He entered the Franciscan order at an early age, and obtained great celebrity as a preacher. After having been successively professor at Rimini and at Siena, he became inquisitor-general in Venice (where his firmness in controversy with the Venetian Government exposed him to personal danger), theologian at the council of Trent, and ultimately vicar-general of his order. In 1565 he accompanied the papal legate to Spain, and in 1570 was created cardinal by Pius V., and entrusted with the publication of a correct edition of the works of St Ambrose, which appeared in 1579–1585. Finding himself out of favour with Pius's successor, Gregory XIII., he withdrew to a villa which he had purchased, and lived in strict retirement, affecting, it is said, to be in a precarious state of health. According to the usual story, which is probably at least exaggerated, this dissimulation greatly contributed to his unexpected elevation to the papacy on the next vacancy, 24th April 1585. If the electors had indeed anticipated a weak or ephemeral pontificate, they were grievously disappointed. Sixtus speedily proved himself one of the most vigorous popes, both in body and mind, that had ever occupied the chair of St Peter. Within two years he issued seventy-two bulls for the reform of religious orders alone. Ardent, despotic, indefatigable, he did everything by himself, rarely invited advice and still more rarely followed it, and manifested in all his actions a capacious and highly original genius, in most respects eminently practical, but swayed in some things towards the visionary and fantastic by the inevitable effects of a monastic training. His first great aim was to purge the papal dominions of the robbers who had overrun them under the weak administration of his predecessor. This salutary undertaking was effectually accomplished, not without many instances of tyranny and cruelty which have left a stain upon his name; but security of life and property returned. Sixtus's financial management seemed on a superficial view equally brilliant; he had found the exchequer empty, and speedily accumulated an immense treasure. But this end was obtained partly by excessive taxation, partly by the sale of offices which had never before been venal; and the withdrawal of such an amount of specie from circulation impoverished the community. His intention was to amass a fund for use in special emergencies, such as a crusade or a hostile invasion, which never arose. Much, nevertheless, was expended by Sixtus in the encouragement of agriculture and commerce, and in public works, either of signal utility, like his supply of Rome with water, or such at least as impressed the popular imagination with his munificence, as the completion of the cupola of St Peter's, the construction of six new streets, and the elevation of four Egyptian obelisks in various parts of Rome. Though a scholar, Sixtus was no humanist, and did much mischief to the monuments of antiquity, ruthlessly destroying some, and disfiguring those which he repaired by the addition of Christian attributes. In his ecclesiastical and foreign policy good sense contended with eccentricity but usually obtained the upper hand. He thought of attacking Turkey with the alliance of Poland and Russia, of subjugating Egypt by his own forces, of making a descent into Syria and carrying off the Holy Sepulchre. But he never attempted to realize these projects, and his conduct of the affairs which imperatively required his attention evinced more moderation than could have been expected. After having strongly sided with Spain and the League, he allowed himself to be convinced by the Venetian ambassador of the evil consequences of Spanish preponderance in Italy, and showed a manifest disposition to acknowledge Henry IV. as king of France, on condition of his abjuration. This led to violent altercations with the Spanish ambassador, and the death of the pope on 27th August 1590 was attributed by many to poison, though without sufficient ground. He was succeeded by Urban VII. Sixtus V. left the reputation of a zealous and austere pope,—with the pernicious qualities inseparable from such a character in his age,—of a stern and terrible but just and magnanimous temporal magistrate, of a great sovereign in an age of great sovereigns, of a man always aiming at the highest things and whose great faults were but the exaggeration of great virtues.

The best view of his character and government is that given by Ranke. Leti's well-known biography is full of fables; Tempesti is too panegyrical; and Lorentz is little more than a compiler from the two. The most valuable part of Baron von Huebner's *Sixte Quint* (Paris, 1870) is the rich appendix of documents. Sixtus's note-books and drafts of letters in the Chigian library, frequently referred to by Tempesti and Ranke, were published by Cugnoni in 1882. (R. G.)

SKATE. See Ray.

SKATING, as at present practised, may be defined as a mode of progression (usually rapid) upon smooth ice, by the aid of steel blades attached to the soles of the feet. It probably originated in the far north of Europe, in Scandinavia and Germany; where it is still in common use. In Russia it has never been a national pastime, as no smooth ice is formed in the rapidly running rivers. Even in St Petersburg it is mainly engaged in by English and Germans. The earliest skates appear to have been certain bones of large animals, but wood was also used from an early period.

In modern skating there are two totally distinct styles, which require different skates differently attached to the feet, and different extents and qualities of ice. The first, the "running" or "fen" style, simply consists in going straight ahead at the highest possible speed. Its home is on the fiords of Scandinavia, the fens of Lincolnshire, and the large rivers and lakes of North America. In Holland, Denmark, and North America it is the medium for carrying a large winter market traffic. It first became common in England in 1662 after the return of the Stuarts. The wooden part or stock of a running skate is from 8 to 12 inches long, according to the length of the foot. The blade is made of the best steel, with an average width of $\frac{5}{32}$ inch. The heel is at right angles to the surface of the ice. The prow begins to rise off the ice at the fore end of the stock, at a gradually increasing angle, and projects 4 inches. The entire skate is attached to the foot by an iron screw in the heel of the stock which enters the skater's boot heel and two long straps which pass through slots in the stock and fasten round the ankle and toes of the skater. The length of the heel strap varies from 22 to 32 inches, and that of the toe strap from 15 to 23 inches. Formerly the bottoms of the blades were fluted. A concavity is now effected by grinding; and, when in motion, the blade is rarely flat on the ice. The curve should be slight, and the depth

no greater than will ensure a curve being made without touching the ice. The feet are placed at right angles to each other with the toes turned out and the body bent slightly forward. Each foot is then raised alternately and set down slightly on the inside edge. It immediately acquires a forward motion, which is increased by pushing with the other foot, that being at right angles and having no sliding motion. The feet must be kept perfectly level when raised and set down, and the skate carried in the same manner an inch above the ice when going forward. The forward stroke is made on the outer edge, and the pressure applied to the inner edge of the other foot. The arms are swung across the chest from side to side, and opposite to the direction of the striking leg in order to balance the weight. The quickest method of stopping is to place the feet parallel, dig the heels into the ice, and arch the back. A longer but more graceful method is to turn the toes inwards, thus spreading the outside edges athwart the line of going. The feet should never be looked at, as the balance of the body is thereby disturbed. The eye should always be on a line with the horizon.

The fastest skating times recorded, from a standing start, and with no rear wind, have all been made in the United States, at New York, as follows:—100 yards, $10\frac{3}{8}$ s.; 200, $21\frac{5}{8}$ s.; 300, $31\frac{2}{5}$ s.; $\frac{1}{4}$ mile, $44\frac{1}{5}$ s.; $\frac{1}{2}$, 1 m. $41\frac{4}{5}$ s.; $\frac{3}{4}$, 2 m. 34 s.; 1, 3 m. $26\frac{2}{5}$ s.; 2, 6 m. $56\frac{1}{5}$ s.; 3, 10 m. $33\frac{2}{5}$ s.; 4, 14 m. $10\frac{1}{2}$ s.; 5, 17 m. 45 s.; 6, 21 m. 38 s.; 7, 25 m. $17\frac{4}{5}$ s.; 8, 29 m. $9\frac{4}{5}$ s.; 9, 32 m. $54\frac{1}{5}$ s.; 10, 36 m. $37\frac{1}{5}$ s.; 20, 1 h. 14 m. $7\frac{1}{5}$ s.; 30, 2 h. 31 m. 12 s.; 40, 3 h. 21 m. 22 s.; 50, 4 h. 13 m. 36 s. The best running high jump on skates recorded is 3 ft. $1\frac{3}{4}$ in., and running long jump 15 ft. 2 in.

The second style, termed "figure skating," is quite modern and purely English in its origin. This may be practised on any small pond, provided the ice is clear of snow and perfectly smooth. The more numerous opportunities thus afforded make it the more popular style in Great Britain, where the large streams seldom freeze. Figure skating consists in cutting arcs, circles, figures, letters, serpentines, and spirals,—either forwards or backwards, slowly or rapidly, on one or both feet, singly or in combination. The style can ultimately be analysed into four kinds of strokes, all made on the edges of the blade—the inside forward, the outside forward, the inside backward, and the outside backward. The variety of evolutions which can be developed from these four movements is endless. The figure skate is made entirely of metal, is strapless and fixed to the boots by clamps or like devices. Unlike the running skate, it can be instantly put on or taken off. Many kinds have been invented, but the "Acme," first produced in Canada, is generally acknowledged the best. The blade projects the merest trifle beyond the length of the foot and is rounded off in an upward direction from the ice at both toe and heel. The bottom is $\frac{1}{4}$ inch wide, and the best curve for grinding it is to that of a seven-foot radius, equal throughout and not increased at either end. In stopping, the end of one skate is placed at right angles to the other.

Summer skating has been occasionally provided in "glaciariums" by means of artificially produced ice.

The London Skating Club, founded in 1830, is the leading skating society of Great Britain. Comprising but 170 members, including 20 ladies, and practising on exclusively private water in Regent's Park, it countenances figure skating only and gives no encouragement whatever to the spread or teaching of a national pastime. The National Skating Association was formed in the year 1879, and, on December 8, held the first race for the running championship at Thorney, Cambridgeshire. The objects of the association are as follows:—

To promote, ascertain, and reward speed in skating,—by the establishment and management of amateur and open skating championships of England, by stimulating and supplementing local action in holding of skating matches, by establishing an order of merit for speed skaters and awarding badges for the same, by assisting in providing facilities for skating by the shallow flooding of land in each locality where local branches exist, and by collecting through corresponding members information of the existence of ice on which skating is practicable, and the supplying of such information to its members, and to promote and encourage figure skating, by the establishment of standards at which figure skaters may aim, by bestowing badges of merit on those who attain these standards, and by promoting and assisting in the formation of skating clubs. To provide rules and regulations for the game of hockey on the ice. Also to promote the establishment of international skating contests in various countries under the direction of an international council.

In the United States and Canada large and shallow artificial ponds under cover, termed "rinks," are in winter frozen by filling them with water. Each night the surface is covered with a layer of water, which gives a fresh sheet of ice by morning. The covers protect the rinks from snow, another great advantage.

As regards a substitute for ice and ice skating on wooden or asphalt floors, the only invention that has ever been found even partially successful is that of James L. Plimpton of New York in 1869. The implements may be described as skates with two parallel wheels at the toe and heel, so hung that the wheel axles are moved out of parallel by the transverse rocking of the skater's foot, the wheels setting squarely on the surface whether the skater be upright or canted. The fatigue caused by these "roller skates" is quadruple that of ordinary ice skating.

See *The Field*, December 23, 1882, January 6 and February 3, 1883; N. and G. A. Goodman, *Handbook of Fen Skating*, 1882; G. Anderson, *Art of Skating*, 4th ed., 1880; H. C. Vandervell and T. M. Witham, *Figure Skating*, 3d ed., 1880; and M. F. M. and S. F. M. Williams's *Combined Figure Skating*, 1883.

SKELETON

THE word "skeleton," meaning in Greek a mummy, is popularly taken to denote that assemblage of bones and cartilages which forms the internal support of the body of man and of the animals more or less nearly resembling him. A slight acquaintance with the structure of these animals, however, seems to make it evident that a wider signification must be given to the term, since parts which in man and many of his animal allies are bony or cartilaginous may be only membranous in other such animals; and, conversely, parts sometimes quite external, which are merely membranous in man and many animals, may in others assume the structure of horn or bone or may contain bones or cartilages. The word skeleton may indeed be taken to denote both a more or less firm and complete *external* protection to a living body, and also a more or less firm and complete *internal* support to such body.

In this very wide sense even many vegetal structures may be said to possess a skeleton. For all plants which can sustain themselves in an upgrowth from the ground obviously both require and possess solid structures—various groups and varieties of woody fibres—to support such an upgrowth. Organs also, such as leaves, which need to be maintained in the form of a thin flat expanse, require and possess bundles of fibres (vulgarly called veins) which are even popularly said to constitute the skeleton of the leaf. Many plants form such skeletal structures largely of silex, as do the grasses and the horsetails (*Equisetum*), and others invest themselves to a greater or less degree with carbonate of lime, as do some *Algæ*, such as *Corallina* and *Melobesia*, while the *Desmidiæ* clothe themselves with a horny coat. Ordinarily, however, the word skeleton is only used to denote certain animal structures, and mainly such structures as form the skeleton of man and of creatures so nearly allied to him as to constitute, together with him, that primary division of animals known as backboned animals or *Vertebrata*.

It is to a concise description of the skeleton as it exists in Vertebrates generally that this article is devoted. For the details of the human skeleton the reader is referred to the article ANATOMY. In order, however, that its condition in Vertebrate animals may be better understood, it will be well briefly to point out some of the more important varieties of condition presented by the protecting or supporting parts of the body of the lower, or Invertebrate, animals.

THE SKELETON OF INVERTEBRATA

A great and fundamental distinction exists, however, between those lowly organisms known as *Protozoa* or *Hypozoa*—which are generally reckoned as animals—on the one hand and all the higher forms, both Vertebrate and Invertebrate, on the other. It is a distinction which renders it difficult to regard any skeletal structures of the *Hypozoa* as answering to, in the sense of being the homologues[1] of, any of the skeletal structures of higher animals. This great fundamental distinction consists in the fact that the bodies of all the higher animals are made up of distinct "tissues," which are derived from three different layers of cells, of which the embryos of all[2] of them are for a time composed, whereas the bodies of the *Hypozoa* either consist of but a single cell or else of a smaller or larger number of cells more or less loosely aggregated and not forming any distinct tissue. It follows of course that their reproduction does not take place by means of embryos formed of cellular layers.

Nevertheless the *Hypozoa* or *Protozoa* may exhibit very distinct protective structures. Thus the outermost layer of the substance of an *Amœba*, called its ectosarc, is of a firmer consistency than its interior, and it may in allied forms take on a chitinous character or become quite hard through the deposition within it of calcareous salts (as in the sometimes singularly complex shells of the *Foraminifera*) or form symmetrical cases of silica.

In the *Radiolaria*, the skeleton of the *Protozoa* attains its maximum of beauty and complexity. It consists of spicules which are generally siliceous, but may consist of a peculiar firm organic substance termed "acanthin." The spicules arrange themselves in an extraordinarily symmetrical manner, generally radiating from the central portion of the organism and being connected with one or more series of encircling spicules which may constitute a series of concentric spheres.

Among the *Infusoria* we also find examples of a hardening of the external cuticle, as in *Tintinnus lagenula* and in some other forms.

When we pass to that vast group of animals—the *Metazoa*—which includes all but the *Protozoa* (and all those therefore the bodies of which are formed of tissues derived from the three primitive layers), a distinction again requires to be drawn between the Sponges (*Porifera*), which constitute its lowest group, and all higher forms. The three primitive or germinal layers of the *Metazoa* are termed respectively—(1) the epiblast, (2) the mesoblast, and (3) the hypoblast. Of these three layers the epiblast and the hypoblast are to be regarded as primary.[3] The epiblast is essentially the primitive integument, and its cells give rise to the epidermis and cuticle and to the organs of sense. The hypoblast is essentially the digestive layer, and gives rise to the epithelium lining the alimentary canal. The mesoblast seems to originate from one or both of the two preceding layers, and gives rise to the general substance of the body—including that part of the skin which is beneath the epidermis, the muscles, and the blood vessels. It may divide into two layers, whereof the more external is distinguished as "somatic," while the more internal is called "splanchnic." Such is the general condition of the three germinal layers in the *Metazoa*. In the Sponges, however, it seems probable[4] that the germinal layers have a different nature—the epiblast and mesoblast being respectively the digestive and sensory layers.

The skeletal structures of the Sponges have the form of spicules, which may vary greatly in different genera as to their form, while they may be siliceous, calcareous, or horny. Sometimes they constitute structures of singular beauty. They appear to be formed in or on the cells of the mesoblast, and it does not seem that any skeletal structures arise in the epiblast or hypoblast of the *Porifera*. Should such, however, be hereafter found, then it must be borne in mind that their homologies with analogous skeletal structures of other organisms must depend on the final decision of the question of the exact relations which may exist between such germinal layers in Sponges and the epiblast and hypoblast of higher *Metazoa*.

In the great group of the *Cœlentera*, the skeleton may be either epiblastic or mesoblastic in nature. Thus in the *Hydrozoa*—where it mostly has the form of a horny investment, but may be (as in the Millepores) calcareous—it is epiblastic. In the *Actinozoa*—which includes the true coral animals—it is generally mesoblastic, although it is formed from the epiblast in the *Gorgonidæ*, *Isidinæ*, and *Pennatulidæ*.

In *Isis* the skeleton curiously consists of a series of segments which are alternately horny and calcareous.

In the *Echinodermata* we generally have, notably in the Sea-Urchin (*Echinus*), a wonderfully complex skeleton which is so near the outer surface that at the first glance it seems necessarily a most external form of skeleton. Nevertheless the plates which compose it are mesoblastic in nature and are independent of the epidermis.

The two valves forming the shell of the Lamp shells (*Brachiopoda*), and the very different two valves which constitute the shells of creatures of the Oyster class (*Lamellibranchiata*), as well as the single shells of the Snail and Whelk class (*Gasteropoda*), are all epiblastic in nature, and are calcifications of the outer part of the epidermis. The same is the origin of the apparently internal shell of the Slug, which is at first external in the embryo and subsequently becomes enclosed.

Similar is the nature of both the internal and external shells of the Squids, Cuttle-fishes, and Nautili, *i.e.*, of the class *Cephalopoda*. In the last named class, as in some Gasteropods, there is a cartilaginous structure inside the head, which structure supports and partly protects the brain. It is unlike any skeletal part yet mentioned save in its mode of origin, which, like the skeleton of some of the *Actinozoa*, is mesoblastic.

Lastly may be mentioned the hard protecting external coat of insects and animals of the Crab and Lobster class—in short, the external skeleton of that primary division of animals which is called *Arthropoda*. This is again epiblastic, and a hardening of a cuticle on the outer surface of the epidermis—a hardening effected generally by chitinization (the deposition in it of a substance termed "chitin"), or, as in many *Crustacea* and some *Myriapoda*, by calcification.

GENERAL SKELETAL CONDITIONS.

Having thus briefly glanced at the leading skeletal structures of a number of groups of lower organisms, we may make the following generalization, which will be of use to us in helping us to understand how the skeletal parts of backboned animals stand related to the skeletal parts of animals lower in the scale:—

(1) Skeletal structures may conceivably arise in parts which are epiblastic, or mesoblastic, or hypoblastic.

(2) Skeletal structures belonging to any one of those three categories may be further divisible into two subordinate categories according as they belong to a superficial or a deep part of the layer to which they appertain.

(3) Skeletal structures may be siliceous, chitinous, calcareous, cartilaginous, or horny.

(4) In certain animals the mesoblast subdivides into two layers, one *somatic* and the other *splanchnic*. Obviously, then, there may be skeletal parts corresponding to either of these last-named layers, and conceivably to a deeper or more superficial portion of either of them.

THE SKELETON OF VERTEBRATA.

The skeleton of the *Vertebrata*—that is, of the five classes of animals named *Pisces*, *Amphibia*, *Reptilia*, *Aves*, and *Mammalia*—may in the first place be most conveniently considered as consisting of two parts—a dermal skeleton, or *exoskeleton*, and an internal framework, or *endoskeleton*. The latter, which is generally much the more considerable, is mesoblastic, and the muscles are external to it.

External Skeleton of Vertebrata.

This division of the skeleton is itself again made up of two parts. The more external of these is the epidermis and is of epiblastic origin, and dense epidermal structures may arise towards its inner or its outer surface. The more internal constituent of the exoskeleton is the dermis and dense structures formed in it, and these are from the outer portion of the mesoblast.

Epidermal hard structures formed towards either surface of the epidermis may become intimately united with subjacent dermal hard structures, and then again, as we shall see, with parts of the true endoskeleton.

[1] "Homologous parts," or "homologues," are parts of an organism which correspond in relative position, that is, in their relation to surrounding structures, whether or not they serve the same ends. They thus differ from "analogous parts," which are parts performing similar functions whether or not they agree as to their relations of position to surrounding structures. Thus, *e.g.*, the nail of a man's middle toe and the hind hoof of a horse are "homologous parts," but the hoof, as the support of the body and agent in locomotion, is analogous to the whole foot of a man.

[2] Certain Cœlenterate animals consist but of two layers.

[3] See F. Balfour's *Comparative Embryology*, vol. i. p. 103.

[4] *Op. cit.*, vol. i. p. 122, and vol. ii. p. 285.

Any hard structures formed in the walls of the alimentary canal—the lining of which is continuous at either end with the external skin—are to be reckoned as fundamentally exoskeletal. In the process of development the epiblast becomes inflected more or less into either extremity of the alimentary tube, but the intermediate portion, together of course with any hard structures developed in it, is of hypoblastic origin.

In the great majority of Vertebrate animals the two layers of the skin, the epidermis and the dermis, are, as in man, soft, though locally provided with certain denser appendages, such as epidermal and dermal scales, hairs, nails, scutes, and teeth.

The soft general exoskeleton or skin invests the body of Man pretty closely, though slightly projecting folds of it extend between the roots of the fingers and toes. In some abnormal cases these folds extend so far and bind the digits together so much that the thus malformed person is said to be "web-fingered" or "web toed." Such a condition is found normally in many animals, as notably in Ducks and Geese, and such parts form a large portion of the "wing" of the Bat.

Other extensions of the skin of the body are noteworthy. Thus in the "Flying" Squirrels and Opossums, and the curious Rodent named *Anomalurus*, the skin of the sides, between the arms and the legs, is much expanded, serving for a parachute. There may be a skin parachute supported by long free movable ribs, such as we shall see exist in the little Lizards called "Flying Dragons." There may be a very remarkable extensive skin round the neck, as in the Frilled Lizard, and folds of skin may hang freely, as in the "dewlap" of Cattle, or may be formed here and there as in the Rhinoceros, the skin of which animal is so thick as to necessitate the existence of such folds to allow free movements to the body and limbs. Long filamentary processes may be formed along the back, as in the Iguana and various other Lizards.

In the Seals a fold of skin connects together the hind legs and the tail, and also in our common Bats, which have in addition their very elongated webbed fingers connected with the sides of the body and legs by another great fold of skin which, with those between the fingers, forms the entire bat's "wing."

The integument may be very distensible, as in those Fishes (*e.g.*, *Diodon*) which distend themselves with air and then float belly upwards.

The epidermis of many Vertebrates, and of Man, is shed in minute fragments, constantly removed by friction and ablution, and constantly replaced; only under abnormal conditions and after certain diseases does it come away in large and continuous patches. In some other Vertebrates, as notably in Snakes, the entire epidermal investment of the body, even that of the eyes, is cast off entire as one whole.

The epidermis never has its superficial layer connected with bone, but it often becomes thickened and horny as we see in the sole of the foot, or the labourer's hand, and in those abnormal thickenings called "corns." Certain local thickenings which are not abnormal may exist in animals; such are the callosities on the inner side of the legs of the Horse, on the breast of the Camel, and on the nates of the lower Old-World Apes.

Of the appendages of the epidermis the most simple are scales, such as we find on the legs of Birds and the bodies of Serpents and Reptiles generally.

A *scale*—a true scale, such as those of Snakes and Lizards—consists of papillæ of the dermis invested by the epidermis, the whole being covered by a cornification of the external part of the epidermis. Scales may be very diverse in shape, prominence, and relative size, and may form very large plates. The so-called scales of Fishes are of deeper origin and are a form of scutes.

A *hair* differs from a scale in that, instead of being an epidermic investment of a dermal projection outwards, it originates by an epidermal projection inwards into the subjacent dermis. A small papilla of the dermis, however, soon projects upwards, in turn, into the descending epidermal process, and then cornification sets in (at first in the immediate vicinity of the dermal papilla) in the cells around the axis of the epidermal descending projection, and this hardened portion soon projects beyond the surface of the body, while the part of the epidermis about its deepest part becomes modified into its so-called "root."

A *nail* or *claw* arises as a cornification of the epidermis (but not of its deepest layer) lying upon numerous very vascular ridges (or transversely elongated papillæ) of the dermis, forming the primitive bed of the nail, and enclosed in a deep fold of the integument. One end of the structure becomes free and projecting superficially, while the opposite region grows by epidermal additions from beneath and at its attached extremity.

A *feather* is more nearly related to a scale than it is to a hair. It consists at first of an upwardly-projecting dermal papilla invested with epidermis, and it is only at a later stage that its base sinks into a sack or "feather follicle." The outermost layer of epidermis becomes converted into a horny sheath, which is thrown off when the feather is completed. The *quill* is formed by cornification of the deepest and more superficial layer of epidermis investing the base of the dermal and vascular papilla, and is open at both ends. The vascular papilla it encloses shrinks up when the feather is fully formed. The *vane* of the feather is formed from the more apical portion of the papilla, and its central part, or *shaft*, is continuous with the quill, while ridge-like thickenings of epidermis diverging from either side of this central part constitute the barbs of the vane, from each of which yet smaller processes or barbules proceed.

A *scute* is a hardening of the outermost portion of the dermis, with an investment from the deepest layer of the epidermis. Such are the so-called scales of ordinary Fishes, which may be represented by the bony plates and processes called placoid scales—so common in the groups of Sharks and Rays. In these latter structures dermal papillæ appear and calcify, forming a dense structure without corpuscles, called dentine, beneath which may be a corpusculated structure of true bone. The calcifying papillæ receive an investment of still denser calcareous tissue, called enamel, from the deepest layer of the epidermis. These placoid structures often come to project outwards on the surface of the body as long spines or as shorter tooth-like processes, or they may protect the surface of the body as flat plates. Often the dentine more or less entirely atrophies, so that the structure comes to be formed almost entirely of true bone or of that peculiar calcified tissue of which the scales of ordinary Fishes (such, *e.g.*, as the Perch and Carp) are composed.

A *tooth* is a structure closely related to a scute. It differs from the latter just as a hair differs from a scale—namely, by owing its origin to an ingrowth of the epidermis instead of merely to a primitive outgrowth of the dermis.

The so called teeth of the Lamprey are not true teeth, but are merely horny epidermal structures essentially similar to scales.

In the origin of a true tooth a process of the epiblastic layer of the mouth—the buccal epithelium—grows into the subjacent dermis, and, assuming a cup-like form (with the concavity of the cup turned away from the epithelial surface of the mouth), a dermal papilla rises into the cup. The apex of this papilla then superficially calcifies into dentine, and becomes invested with a layer of enamel formed from the immediately adjacent surface of the epidermic cup or "enamel organ." An investment of connective tissue called the dental capsule becomes formed round the whole. The dentine then increases, a remnant of the papilla remaining as the "pulp." The young tooth gradually approaches the buccal surface, and the base of the papilla becomes formed into the root or fang of the tooth. The enamel organ does not descend so far, but only invests the crown of the tooth. The inner layer of the capsule, however, investing the fang gives rise to a third dental tissue known as the cement. A bud may or may not be given off from the developing tooth to serve as its future successor.

Thus teeth are normally both epiblastic and mesoblastic structures, but in certain Fishes they line parts of the throat (the branchial arches), the superficial membrane of which is derived from the hypoblast, and such may of course be considered as hypoblastic skeletal elements, and, thus considered, must be reckoned as constituting a separate category of teeth.

Such being the various kinds of dense structures which enter into the composition of the Vertebrate exoskeleton, each kind may be developed to a greater or less extent in different groups of Vertebrate animals.

Exemplifications of Epidermal Skeletal Parts

Scales entirely clothe the bodies of most Lizards and Snakes and the legs of Birds. In Tortoises and Turtles they take the form of large plates, which in one species are known as tortoise-shell. The

shape and size of scales are made great use of as distinctive characters for classification See REPTILES The scales of a Serpent are held together by their epidermic investment in such a way that it and they are cast off as one whole each time the animal effects that process known as changing its skin In the Rattlesnakes curiously modified thickenings of epidermis surrounding the end of the tail are not cast off but continue partially adherent, as growth proceeds and successive castings of the skin take place, these ring like thickenings become numerous, and so knock one against the other, when the end of the tail is vibrated, as to produce a singular sound—the so-called rattling of the system of rings or "rattle"

Hairs form the characteristic clothing of the class *Mammalia*, though certain Mammals, such as Whales and Porpoises in their adult condition, are naked Man is quite exceptional in having the ventral surface of the body more hairy than its dorsum Long hair on the head, and whiskers and beard, are variable human characters, also possessed by some Apes, and many animals—as the Lion, the Horse, the Aardvark, &c —have long hair in one or other region of the body Some hairs may be especially thickened and serve as feelers, as in the "vibrissæ" or "whiskers" of the Cat tribe But the maximum of development is shown in such creatures as the Hedgehog and the Porcupine, where hairs become dense and solid spines

Nails do not exist in the class of Fishes and rarely in that of Batrachians They first make their appearance in the most simple form—that is, in the form of slight thickenings of the epidermis—at the ends of the digits in certain Toads and of one kind of Eft A nail is at its maximum of development when it quite surrounds and encloses the last or end bone of the digit which bears it Such nails exist in Horses, Oxen, &c, and are called hoofs A nail when produced into a sharp point is called a claw,—as in the familiar case of the Cat, and also in Birds Nails may, however, be much reduced in size and not nearly extend to the end of the digits which support them, as in the Sea Bears They may be altogether wanting, even in Mammals, as in the Porpoise, or attain a prodigious relative size, so that the body can be suspended by them in progression, as in the Sloth

Nail like structures may be developed from the side of the hand, as in certain Birds (*e g*, *Palamedea*), which are said to be "spur-winged," and in a Mammal (*Ornithorhynchus*) a hollow horny spur grows upon each ankle

In the Rhinoceros we meet with a horn, or two horns, which grow up from the dorsum of the muzzle like a great blunt nail, long dermal papillæ extending into it and answering to the dermal ridges beneath a true nail In Owen's Chameleon no less than three long horns are developed—one from the nose and a symmetrical pair from the front of the head

Other horns which do possess bony cores are developed from the head in pairs on the so-called hollow-horned Ruminants, *i e*, the Oxen, Antelopes, Goats, and Sheep, and only in one anomalous form, the Prongbok (*Antilocapra*), are these horny structures shed at intervals, in the rest they persist throughout life Normally there is never more than one pair amidst existing Ruminants, with the exception of the Four horned Antelope, which has two pairs Such horns may be straight or curved or spirally twisted, but they are never branched, with the single exception of the Prongbok

Sharp edged, overlapping, horny plates (each of which is comparable with a nail) may be developed beneath the proximal part of the tail, as in the curious Rodent *Anomalurus* Such plates may clothe the entire body, head, limbs, and tail, as in the scaly Manis or Pangolin

The epidermis and epithelium which respectively line the outside and inside of the jaws may both be converted into horn, forming a small beak which may be composed of a number of close set processes and may be temporary, as in the Tadpole, or permanent, as in the Siren Larger and denser structures of a similar kind form the beak of Birds and of the Turtle and of that most exceptional Mammal, the Ornithorhynchus

The epithelium within the mouth may be locally cornified, forming horny teeth which have, as before mentioned, rather the nature of scales—as in the suctorial mouth of the Lamprey

In certain Beasts, as the Cow and the Sheep, the front edentulous part of the upper jaw is invested by a horny epithelial pad against which the teeth of the front of the lower jaw bite A much more developed structure is met with in the Dugong The front of both jaws is furnished with a dense horny plate formed like the horn of the Rhinoceros, though of course widely different in shape But the maximum development of this kind of structure is found in the Whalebone Whales The upper jaw in these is furnished with very numerous horny plates, termed *baleen*, which hang down from the palate along each side of the mouth They thus form two longitudinal series, each plate of which is placed transversely to the long axis of the body, and all are very close together The outer edge of each plate is entire, but its inner edge gives forth numerous hair like processes These are some of the constituent fibres of the horny plates which thus, as it were, fray out and line the sides of the buccal cavity with a network of countless fibres formed by the inner edges of the two series of plates This network acts as a sort of sieve, allowing water to escape between the plates but retaining in the mouth the small creatures on which the whale feeds

Cornifications of the tongue may exist Thus in some Birds, as in Woodpeckers, the structure of its apical portion becomes so dense that it serves as a dart or spear Its surface may be more or less cornified in Beasts Thus it may be furnished all round with backwardly pointing spines, as in the Lesser Anteater (*Tamandua*) There may be a large horny papilla on each side of it, as in the Manatee or Ornithorhynchus, or there may be horny plates on the tongue, as in the Java Porcupine

Horny structures also exist which cannot be considered as either epiblastic or mesoblastic, but must be hypoblastic in origin Such are the horny linings of the stomachs or gizzards of Birds, and the similar lining of the stomach of the Great Anteater, *Myrmecophaga jubata*

Feathers are the universal and peculiar cutaneous appendages of Birds, and generally differ much in size in different parts of the body, long and strong feathers constituting the most conspicuous part of the wings and so-called "tails" of Birds Feathers are implanted on the body neither in an irregular nor in a uniform manner, but are aggregated together in different modes in different groups of Birds—each definite patch of implanted feathers being called a feather tract The arrangement of these tracts in a bird is called its "pterylosis," and serves amongst other characters to distinguish different groups of Birds one from another

Exemplifications of Dermal Skeletal Parts

Scutes —True dermal ossifications are met with in some kinds of Mammals Thus the Armadillos possess a very complete external *dermal* skeleton formed of small many-sided bony scutes, the margins of which are adjusted together, and which are differently aggregated—into transverse bands or into larger inflexible masses—in different species In the extinct *Glyptodon*, the body was invested, from the neck to the root of the tail, with one such solid case

In the Armadillos a horny *epidermal* skeleton is so adjusted to the bony case that the former is divisible into small scales corresponding with the several scutes Amongst Reptiles, we find in the Tortoises and Turtles (*e g*, *Emys*, *Testudo*) a solid exoskeleton, the dorsal part of which is called the "carapace," while the ventral portion is named the "plastron" The former consists of a median series of scutes, to each side of which is annexed a series of lateral scutes which are more elongated transversely to the long axis of the animal's body, and these three series are intimately united with subjacent portions of the internal skeleton The carapace is completed by a series of smaller scutes, which surround it and are therefore called "marginal" scutes The plastron consists of eight pairs of scutes and one azygous scute In the Box-Tortoises the ends of this plastron are movable, and (the head and limbs of the animal being drawn in within the shell) can be applied to the ends of the carapace, so that all the soft parts can be completely enclosed within the dense exoskeleton As in the Armadillos, the bony scutes are covered by epidermal scales, some of which have been already referred to as constituting "tortoise shell" Unlike the Armadillos, however, the segments of the epidermal and dermal skeletons do not correspond The dorsal scales are much larger and less numerous than are the scutes, but, while the scutes of the plastron are but nine in number, it has twelve horny plates or large scales

Amongst the *Amphibia* certain Frogs (*e g*, *Ephippifer* and *Ceratophrys*) develop dorsal osseous scutes, and these, as in the Tortoises, are more or less united with parts of the subjacent internal skeleton

A solid skeleton of juxtaposed osseous scutes may exist in Fishes, as in the Bony Pike *Lepidosteus*, where the scutes are enamelled and united by a peg and-socket articulation *Polypterus* also has an investment of bony scutes, and in the extinct fish *Pterichthys* they were developed into large plates on both the dorsal and ventral surfaces of the body The Sharks and Rays may have their scutes thickly distributed over the surface of the body, but quite small A skin so furnished is called "shagreen" They may also be larger and fewer, and placed far apart, with elegant patterns on their exposed surfaces, or they may take the form of strong defensive spines In the Sturgeon the scutes are arranged in rows along the body, separated from each other by softer portions of integument

In the ordinary bony Fishes, or *Teleostei*, the scutes (commonly but erroneously called "scales") are differently calcified from the scutes of Sharks, and may have their free projecting margin smooth, when they are described as *cycloid*, or in toothed-like processes, when they are termed *ctenoid*, or they may be intermediate between these two types of form The Teleostean scutes are generally separate, but they may coalesce to form a connected

solid investment, as in *Ostracion* and the Seahorses (*Lophobranchii*), or develop strong projecting spines, as in *Diodon*

Fishes have two other very important exoskeletal structures, which may be bony or cartilaginous One set of these structures consists of filamentary processes, which may be either horny or calcareous, and which support the skin of the fins, whether those of the back, belly, and tail, or those of the limbs, such structures are termed "fin-rays" The other set consists of bony or cartilaginous hard parts, which serve to support the fin rays, which therefore lie more deeply, or at least are less projecting, and are commonly termed "interspinous bones or cartilages," but which may be conveniently distinguished as *radials*, they are very important elements of the fins of Elasmobranchs

Certain Siluroid fishes exhibit in the adjustment of portions of their dermal exoskeleton an altogether peculiar mode of articulation, called a shackle joint This is in the form of a dermal scute articulated with a superposed spine The scute has an osseous ring on its dorsal surface, and through this passes another osseous ring which forms part of the base of the superimposed spine

In connexion with dermal scutes and spines may be mentioned those familiar yet exceptional structures, the bony horns of Ungulates In the Oxen, Goats, and their allies horns exist on the head as bony cores, persisting throughout life, and supporting those "hollow horns" before noticed amongst the epidermal or epiblastic parts of the exoskeleton As is the case with the scutes of Chelonians, these bony parts are intimately united with subjacent parts of the true endoskeleton In the Giraffe there are three such bony prominences, which arise as distinct ossifications, and only later anchylose with the skull These are the Giraffe's pair of short horns, together with the median prominence in front of them In the Deer we find bony antlers, which are shed annually and are destitute of any horny covering Antlers may exist in both sexes, as in the Reindeer, but generally they are present in the males only They arise as soft highly vascular prominences, and when fully grown become hardened by calcareous deposit In some months the investing skin dries up and is got rid of, and the horn itself falls off after the breeding season, leaving a stump whence a new antler shoots forth again in the following year Antlers, as a rule, are branched—more so as the individual becomes older, till maturity is attained Some Deer have enormous antlers, weighing as much as 70 lb, and formed at the rate of 1 lb a day

Teeth —The differences in structure, number, form, and development of the dental organs are so great that they cannot here be treated of See vol vii pp 232 *sq* , also vol xv pp 349 *sq*

Internal Skeleton of Vertebrata

The most essential part of the Vertebrate internal skeleton is the spinal column, the foundation of which is laid by a temporary or permanent structure called the notochord or *chorda dorsalis* At the anterior end of the spinal column there is almost always a solid structure known as the cranium or skull, to which mandibular, hyoidean, and branchial arches may or may not be attached The spinal column may be divisible into cervical, thoracic, lumbar, sacral, and caudal portions, and may have processes projecting from it upwards, downwards, or laterally, with arches of varying extent, as neural arches, chevron bones, and ribs, together with a median ventral portion—the sternum The whole of these parts taken together constitute the axial skeleton This may exist alone if the body is limbless, but otherwise additional hard structures are found which together constitute the appendicular skeleton

Vertebrate animals never have more than two pairs of limbs, and each pair is attached to the body by the help of certain skeleton elements termed a limb-girdle, diverging from which are the hard parts which constitute the skeleton of either "appendage" or "limb" In addition to these we find in Fishes certain azygous structures—the unpaired fins,—the osseous or cartilaginous supports of which must be reckoned as a part of the appendicular skeleton With the occasional (or possibly constant) exception of the notochord, the whole Vertebrate internal skeleton is a mesoblastic structure In the great majority of the *Vertebrata* the skeleton is more or less bony, but it always in part consists of cartilaginous and fibrous structures

The number and nature of the solid parts vary with age in the same species When, in the earlier stages of existence, the process of ossification has once begun, it goes on more or less rapidly till maturity is attained, and is continued, to a certain extent, throughout the whole of life

The points at which bone formation begins and whence it radiates are termed "centres of ossification," and there may be one, two, or several of these in what is ultimately to become a single bone Sometimes these "centres" have an important morphological significance, and in other instances they would seem to be determined by the size of the future structure [1] Bones are classed as "cartilage bones" or "membrane bones" according as they are formed either through the previous formation of a cartilage which subsequently ossifies or directly from membrane without the intervention of cartilage These two classes can generally be easily distinguished, but there are instances in which it would seem that what is really the same corresponding bone differs as to its mode of origin in different animals Moreover, a compound bone, formed of a membrane bone and a cartilage bone intimately united, may come to lose either its cartilaginous or its membranous elements, and thus further difficulties of interpretation may arise There are also cases (as in the carapace of Chelonians) in which exoskeletal dermal bones coalesce with subjacent bones of the endoskeleton Such bones may become deeper in position as development advances, and there is reason to think that not a few bones ordinarily reckoned as parts of the endoskeleton are of dermal origin, and first appeared in ancestral forms as placoid scutes or dermal spines

As the development of the skeleton proceeds, ossification tends to fuse together more and more bones which at their first appearance were separate and distinct This is notably the case in warm-blooded animals, and is most noteworthy in the warmest-blooded class—that of Birds

Besides the coalescence of distinct bones, another fusion of bony structures occurs This is due to the fact that the ends, or projecting portions, of what are essentially and ultimately one bone may for a time persist as distinct bony parts, termed "epiphyses" Thus, in the case of Man, the ends of the long bones of the limbs are at first separate from the main part (or shaft) of each long bone, and do not become continuous with the latter till the human frame has nearly attained maturity

The hard parts of the internal skeleton, being those which as a framework support the body, form points of attachment for the muscles which move the body,—such hard parts being used as either levers or fulcra, as the case may be The great majority of the bones are thus intended to move one upon another The contiguous surfaces of bones form "joints," which may be immovable, mixed, or movable The bones of the skull are united by immovable joints, called "sutures" Joints are said to be mixed when the motion allowed is exceedingly slight, as when two bones are allowed to be slightly separated from each other by the intervention of a softer substance which is attached to both We have examples of movable joints in the human neck, the two uppermost bones of which are articulated on the principle of a pivot, in the elbow, which forms a hinge, and in the shoulder, where the upper arm joins the shoulder-blade in a ball and socket joint

If one convex articulating surface be globular, it is termed a head, if it be elongated, it is called a condyle. If either of these is borne upon a narrow portion of bone, this latter is called a neck, if a pulley like surface is formed by such a juxtaposition of two condyles as to leave a depression between them, such an articular surface is named a trochlea

The curious and exceptional arrangement termed a

[1] Balfour's *Comparative Embryology*, vol ii p 448

shackle joint has been already noticed under the head of "Scutes"

AXIAL SKELETON

The whole axial skeleton—including both the cranium and the spinal skeleton—apart from the notochord, is formed from the mesoblastic tissue bordering the medullary groove of the embryo As the essential part of the axial skeleton is the spinal column, so the essential foundation of this column itself is what is known as the "notochord" This is an elongated cylindrical rod of soft tissue running along the antero posterior axis of the body immediately subjacent to the central portion of the nervous system Its mode of origin from the germ-layers of the embryo has yet to be finally determined It is said by Balfour [1] to be developed, in most if not all cases, as an axial differentiation of the hypoblast The cells of the notochord form a tissue resembling cartilage, and it becomes surrounded by a more or less dense fibrous sheath Such an organ is found to exist, temporarily or permanently, in certain lower creatures—Ascidians—which in most other respects widely differ from Vertebrate animals Some few of these animals are furnished with a tail throughout the whole of life, while others are furnished with such an organ only in their larval or immature condition It is alone in such permanent or temporary tail, and not in the body of Ascidians, that a structure of this kind is met with

In every Vertebrate animal the notochord is the first part of the skeleton to appear, and it extends throughout the whole length of the body, as well as of the tail In every such animal, except the Lancelet (*Amphioxus*), it becomes arrested anteriorly in the midst of that secondarily formed skeletal region which becomes the skull In *Amphioxus*, however, in which no skull is ever formed, the notochord extends to quite the anterior end of the body It is enclosed in a strong sheath, within which its substance is segmented so as to resemble a longitudinal series of coins[2] or counters The only other representatives of the internal skeleton in this animal are—(1) longitudinal ligaments (strengthening the sheath of the notochord above and below), (2) fibrous septa which pass out laterally from it between the muscles of the body, to the fibres of which they give attachment, (3) a longitudinal membranous sheath of the central part of the nervous system, forming an elongated antero-posteriorly directed cylinder above the notochord, (4) two vertical septa,—one dorsal, ascending medianly from such neural sheath, and one ventral, descending medianly from the sheath of the notochord in the region of the tail, (5) two jointed cartilaginous filaments which lie one on each side of the longitudinal slit which serves the lancelet for a mouth, and (6) certain cartilaginous filaments which strengthen the sides of the branchial cavity between the intervening vertical fissures of the walls of that cavity

In all other Vertebrate animals the axial skeleton is divisible into that of the head, or the cranial skeleton, and that of the axial skeleton behind the head, or the spinal skeleton

Spinal Skeleton

In all Vertebrate animals except the Lancelet, the axial skeleton is complicated by a longitudinal series of additional hard parts—cartilaginous or osseous—which serve to protect the spinal cord, or marrow, above it, or the great blood-vessels beneath it, and which hard parts support, encroach upon, or replace the notochord itself Nevertheless, the notochord persists throughout the whole of life in certain Fishes both of the lowest and highest types of piscine organization, but it does not persist in its entirety in any adult Vertebrate which is not a Fish

[1] *Comparative Embryology*, vol ii p 449

[2] Owen's *Anatomy of Vertebrates*, vol i p 31

In the Lamprey the notochord persists, but a longitudinal series of small, similarly shaped cartilages strengthen the sides of the more anterior part of the membranous dorsal canal which encloses the spinal marrow In the Chimæra these are more developed, while numerous circular calcifications appear in the notochordal sheath In the most anterior part of the trunk the cartilaginous elements unite to form a continuous investment of the notochord Amongst the Ganoid Fishes, the notochord persists unconstricted and cylindrical in the Sturgeon and the Lepidosiren, but cartilaginous or bony parts appear about it and form a longitudinal series of arches above and below it for the protection respectively of the spinal marrow and sub-vertebral blood-vessels In different kinds of Sharks further complications arise, and the notochord becomes encroached upon, in different modes, by chondrification and calcification, till it becomes segmented by the intervention of a series of thus formed hard parts called "bodies" or "centra," between which relics of the notochord still remain By this process of segmentation there come to be formed what are called vertebræ, the presence of which in the overwhelming majority of Fishes, as well as in all the higher classes of animals, has led to the whole group being called *Vertebrata*

In the vertebræ of most Vertebrates we have a solid body or centrum, from the dorsum of which there arises on each of its two sides a neural plate, which then bends inwards to meet its fellow of the opposite side, thus forming an arch (the neural arch) for the protection of the spinal cord, or marrow, which passes through it From the dorsal side of such neural arch a process called the neural spine very commonly ascends From the sides of the centrum or neural arch, or of both, a single process, or two superimposed processes, may jut outwards, which are known as the transverse process or processes, to which the ribs are generally articulated when ribs are present Inferiorly directed processes, single or double, may descend from beneath the centrum, or may be developed in the intervals between adjacent centra, and are generally related to the protection of large blood-vessels, though they may only serve for muscular attachment

Adjacent vertebræ are commonly connected together by special modifications of the neural arches or the centra, or of both Mostly the opposed margins of the neural arches develop special processes for attachment called articular processes or zygapophyses, and there may be additional interarticulations There may be as few as ten or as many as four hundred vertebræ

Vertebræ may be divisible, as in the highest animals, into five categories —(1) cervical, or those of the neck, (2) dorsal, or those of the back, (3) lumbar, or those of the loins, (4) sacral, or those with which the pelvic limbs are connected, and (5) caudal, or those which are posterior to the sacral vertebræ, or which support the tail when such an organ is present There may be only two categories (dorsal and caudal), as in Fishes

In most Fishes and some exceptional Reptiles the body or centrum of each vertebra is so imperfectly ossified as to remain biconcave or amphicœlous,—that is to say, it presents a deeply concave cup-like form both in front and behind The space thus enclosed by the adjoining cups of each pair of successive vertebræ is filled up by a soft, spheroidal remnant of the notochord, which thus serves as an intermediate connecting substance The cups may become filled up by ossification, as in Man and Beasts, the flattened surfaces being connected by what are called intervertebral disks Each such disk is made of fibrous lamellæ which surround a soft elastic central portion which is a last remnant of the notochord Often the vertebræ may

have the centrum very convex at one end and very concave at the other, and so give rise to a ball-and-socket joint at each junction between the successive centra. Such vertebræ may be procœlous (*i.e.*, have the cup in front and the ball behind), as in existing Crocodiles, or opisthocœlous (*i.e.*, with the cup behind and the ball in front), as in the Bony Pike Fish (*Lepidosteus*), the Land Salamander, and the cervical vertebræ of Ruminants; sometimes a vertebra may be biconvex (*i.e.*, have a ball at each end of its centrum), as in the first caudal vertebra of the Crocodile; or, very rarely, there may be two prominences, or the cups may exist side by side on one surface of a centrum, as in some cervical vertebræ of Chelonians. Instead of intervertebral disks, with spheroidal remnants of the notochord, adjacent vertebræ are often (as in Snakes) united by what are called synovial sacs, or membranous closed bags containing an albuminous fluid called "synovia" and commonly known as "joint oil."

The various parts of a vertebra may be all united to form one single bone, as is generally the case in the higher animals, but such is by no means universally the case. In the Ichthyosaurus we find the neural arch permanently distinct from the centrum, and in the Carp the transverse processes are separate. The neural arch itself may be made up of two separate pieces on each side, as in some Elasmobranch Fishes, *e.g.*, *Raia* and *Spinax*.

Sometimes the neural arch, instead of reposing upon its own centrum only, appears, as it were, shifted so as to be connected with two adjacent centra, as is the case, *e.g.*, with the dorsal vertebræ of Tortoises.

Generally the nerves which pass outwards from the spinal marrow which lies in the neural canal pass out in the intervals between adjacent neural arches. Instead of this, however, they sometimes perforate the neural arch.

Neural spines, though generally single, may be double or altogether absent, and sometimes, as in Tortoises, they may intimately coalesce with superimposed dermal plates.

Cervical Vertebræ.—As has been already indicated, no vertebræ can be distinguished as cervical in the class of Fishes. Nevertheless the first three or four vertebræ next the head may, in some of these animals, present a marked difference from the succeeding vertebræ, being much elongated and united to each other by suture, as in *Fistularia* and *Bagrus*, and they may, as in the latter Fish, develop a continuous inferior vascular canal. The second and third vertebræ may form a hollow bladder-like case of bone, as in *Cobitis*, or send outwards or downwards special processes, as in the Carp.

In Amphibians only a single vertebra can be called cervical, but in Sauropsidans the number may be very large. Thus in the Swan it amounts to twenty-five, while in some of the Plesiosaurians it exceeded forty. Birds, being animals which have to perform with the beak functions which in most animals are performed by limbs, require to have a very movable neck, and consequently a considerable number of joints (and therefore of vertebræ) are required in the neck, which is the only part of the spinal column that is very flexible. In Serpents, which have the whole spinal column very flexible, no really satisfactory line can be drawn between cervical and dorsal vertebræ. In Lizards there are usually from seven to nine, but in the whole class of Mammals (whether the neck be very long, as in the Giraffe, or, like that of the Porpoise, extremely short) there are constantly but seven cervical vertebræ, except in the Sloths, which may have from nine to six, the Manatee, which has but six, and the Manis, which may have eight. All the cervical vertebræ may become anchylosed together into a single mass, as usually in the true Whales. Ordinarily in Mammals the transverse process is said to be perforated, *i.e.*, there are two such on each side, which are short and connected at their distal ends by a bony bridge which represents what, in the thorax, is known as a rib, as is shown by their condition in other classes of Vertebrates. Indeed in the lowest Mammals (*Echidna* and *Ornithorhynchus*) these osseous bridges have the form of distinct, more or less Y-shaped bones, as also in the Crocodile, where they are much prolonged. In many Lizards and Birds the posterior cervical vertebræ bear long ribs, and are only counted as cervical because such ribs do not reach the breast bone, while more posteriorly placed ribs do attain it. The two superimposed transverse processes, with the rib joining them attached to succeeding vertebræ, form on each side of the neck a sort of bony canal in which runs the vertebral artery. Sometimes, however, as in the Camels and Llamas, this canal is replaced by one excavated in the neural arches. In some Cetaceans the external bar (or rudimentary rib) is wanting, so that there come to be two elongated transverse processes on each side.

Successive cervical vertebræ may differ strikingly one from another. Thus in the common European Terrapin we find the fourth cervical vertebra with its centrum convex in front and concave behind. The centrum of the fifth is biconvex. That of the sixth is concave in front with a double convexity behind. The seventh is doubly convex both in front and behind. The eighth is doubly concave at each end. The ninth is doubly convex in front and singly so behind.

The first cervical vertebra is known as the atlas, and joins the skull, which in Man it supports. It may be fused in one solid mass with the skull, as in the Sturgeon, or with a certain number of vertebræ, as in the Rays. It may be united by suture, as in *Bagrus*. The ventral part of the atlas may be unossified, as in the Wombat, or remain a distinct bone, as in the Thylacine. The neural spine may be detached from the neural arch, as in the Crocodile and Tunny. Its ventral part may send out a pointed process towards the head, as in *Amphiuma*. It may develop two concave surfaces to articulate with the skull, as in Amphibians and Mammals, or only a single cup, as in Sauropsidans generally.

The second cervical vertebra is known as the axis, and is distinguishable in all Vertebrates above the *Ichthyopsida*. Its centrum develops anteriorly a special peg-like or tooth like prominence known as the odontoid process, round which the head and atlas vertebra turn as on a pivot. This process may (as in many Reptiles and in the *Ornithorhynchus* amongst Mammals) remain a distinct bone, and is regarded as the true centrum of the atlas, which thus generally coalesces into the axis vertebra instead of with the other portions of its own vertebra. The odontoid process may be absent in certain Mammals, as amongst Cetaceans.

Dorso-Lumbar Vertebræ.—The vertebræ which come between the cervical vertebræ and those (sacral) which support the pelvic limbs, or, when these latter are absent, the vertebræ between the cervical and the caudal vertebræ, form the vertebræ of the trunk. These are subdivisible into dorsal and lumbar when some of them (always the more anterior) bear ribs and others do not but have transverse processes only.

The number of trunk (or dorso lumbar) vertebræ varies greatly, being very few in Frogs and Tortoises and very numerous in Serpents. In Mammals it ranges from about seventeen, in some Primates, to twenty-seven, in *Hyrax*. A definite number of trunk vertebræ is characteristic of certain groups of Mammals, though this number may be made up by different numbers of dorsal and lumbar vertebræ.

Dorsal Vertebræ.—Rib bearing vertebræ are structures constantly found in all Vertebrate animals save certain Fishes and Amphibians. Dorsal vertebræ must be considered as including the whole number of trunk vertebræ in Serpents, since in those animals the whole series of the latter support ribs.

An ordinary Mammalian dorsal vertebra consists of a body and neural arch with articular processes or zygapophyses and with a more or less elongated neural spine, and a transverse process which juts out and bears an articular surface at its end. This process answers to the more dorsal of each pair of transverse processes on each side of a cervical vertebra. Another articular surface placed at about the junction of the neural arch and centrum answers to the more ventral of each pair of transverse processes on each side of a cervical vertebra.

The rib which on each side of the vertebra articulates with these two surfaces has generally itself such a surface at its proximal end (or head) and another on a more or less marked prominence called the tubercle of the rib. These are respectively designated the capitulum and tuberculum, and therefore the processes or articular surfaces of the vertebra to which the capitulum and tuberculum are respectively attached are called the capitular and tubercular processes or surfaces, as the case may be.

Sometimes each vertebra carries but one such articular surface (that for the capitulum of the ribs), as in the Dolphin. The two articular surfaces may co exist at different levels on one single process, as in the dorsal vertebræ of the Crocodile, or they may be in close apposition, and, as it were, fused together, as in Serpents. They may, however, be supported by two quite distinct processes—one dorsal, the other ventral,—as in *Ichthyosaurus* and *Menobranchus*.

Man has twelve dorsal vertebræ. This is a little below the average of his class, where there may be twenty-four, as in the Two-toed Sloth. There are more than twelve in most Reptiles, while in Birds there are mostly but seven to nine, or, very rarely, eleven, while there may, as in *Ciconia alba*, be but three reckoned as dorsal on account of the great extent of ossification in the sacrum or part connected with the legs.

The most remarkable modification of dorsal vertebræ is that in Tortoises and Turtles, where the neural spines expand at their

summits into wide plates which articulate by suture with each other and with similarly expanded ribs, to form the carapace.

In Serpents and Iguanas we have a special mode of vertebral interarticulation, over and above that formed by the zygapophyses. The neural arch develops a median anterior prominence with two articular surfaces called the zygosphene, and this fits into a corresponding median posterior recess called the zygantrum.

The maximum of complication as regards the interarticulation of dorsal vertebræ is found in the last dorsal of the Great Anteater. There each posterior zygapophysis develops two additional articular surfaces, one on each side of a notch which receives a process from the anterior side of the neural arch of the succeeding vertebra, which process is furnished with two corresponding surfaces. More or less distinct traces of certain additional processes, called metapophyses and anapophyses, are sometimes present, but these it will be better to notice when describing the lumbar vertebræ, wherein they are more developed.

We find in some Serpents peculiar processes which project downwards and forwards from the base of the inner side of the transverse processes. We may also find present a long median inferior process extending vertically from the ventral surface of the centrum and as long as, or longer than, the neural spine of the same vertebra. Such processes are present in many Serpents—especially the poisonous ones—and in such Birds as the Penguin and Cormorant.

Lumbar Vertebræ.—These are vertebræ interposed between the dorsal vertebræ and the sacrum; they are generally the largest vertebræ of each vertebral column, but sometimes (as in Bats and Pterodactyles) the cervical vertebræ are yet larger. Lumbar vertebræ are generally to be distinguished in Mammals, in Crocodiles, and in certain Lizards, but not in any Ichthyopsidan.

In Birds lumbar vertebræ are present, but are disguised and hidden by the extent to which the sacral ossification extends forwards.

There are five lumbar vertebræ in Man, but the number in him is below the average of his class, though some Apes have but four. The Slow Lemur may have nine, the Two-toed Sloth has but three, and the Monotremes but two. These vertebræ are very numerous in the *Cetacea*, but the hinder limit of the lumbar region is more or less difficult to determine in these animals. The transverse processes are generally much longer than those of the dorsal vertebræ, and do not bear either capitular or tubercular articular surfaces.

The processes already spoken of as metapophyses and anapophyses are generally much more developed in the lumbar than in the dorsal vertebræ. The former project forwards from the vicinity of the anterior zygapophyses, and the latter project backwards at a lower level. Both processes are to be detected in the last dorsal and first lumbar vertebræ of Man, but are at their maximum in the Armadillos. In addition, also, to the complexity of articulation before described as existing on the last dorsal vertebra of the Great Anteater, we find in that animal's lumbar region an additional articular surface on each side of each transverse process.

The lumbar vertebræ may be anchylosed together and to other parts of the skeleton, as is the case in Birds.

Sacral Vertebræ.—These are distinguished from others, not only by their connexion with the skeleton of the pelvic limbs, but also by their coalescence and a certain degradation in their structure as compared with the trunk and cervical vertebræ. In Man five vertebræ thus coalesce to form the more or less triangular single bone known as the sacrum, but which always shows plain traces of its composite nature. Such coalescence and degradation generally exist in Vertebrates above the *Ichthyopsida*, which possess fully developed limbs. The coalescence of vertebræ is generally less extensive than in Man, though sometimes—as in Birds, some Edentates, and some Reptiles—it is much greater. The sacrum may be composed of as many as ten vertebræ (as in some Armadillos) or of twenty (as in the Ostrich), and the lumbar or caudal vertebræ or both contribute to its formation.

In most if not all Mammals the sacral vertebræ—or the more anterior of them—have what are at first distinctly ossified elements in their transverse processes, which elements (like parts before noticed in the cervical vertebræ) are costal in their nature, *i.e.*, represent rudimentary ribs, and in Crocodiles and Tailed Amphibians the sacral vertebræ have a distinct rudimentary rib attached to each transverse process. In Birds, however, the vertebræ of the sacrum, which have expanded transverse processes, do not develop these from distinct ossifications.

As regards the extent of connexion between the sacrum and the hip bones, union is more extensive in Man than in most Beasts, or in animals below Birds. Often in Mammals and almost always in Tailed Batrachians it may be confined to a single vertebra; but ten vertebræ may be involved in this union in Mammals and twenty in Birds.

That the development of the sacrum is not always in proportion to that of the pelvic limbs is proved by the little Lizard *Seps*, in which, in spite of the rudimentary condition of the limbs, there are true sacral vertebræ.

No Fishes have a true sacrum, though, very rarely, as in the Turbot, we meet with a kind of false sacrum, formed by the anchylosis of the bodies and ventral spines of the first two caudal vertebræ.

Caudal Vertebræ.—The vertebræ of the tail may be as many as 270, as in some Sharks. Amongst Mammals 48 (*Microgale longicaudata*) is the highest number. Man has usually rudimentary caudal vertebræ, completely or partially united so as to form a small conical bone called the coccyx. Its proximal end articulates with the sacrum by its centrum and two small zygapophyses. It has besides two rudimentary transverse processes and two processes representing piers of the absent neural arch. The other vertebræ are destitute of processes and consist but of smaller and smaller vertebral centra. Thus the last vertebra is the very opposite of the first (or atlas), being all centrum, while the atlas has no centrum at all. The coccyx usually becomes anchylosed to the sacrum about or after the middle of life. The caudal region is still more reduced in some Bats, where there may be but two such vertebræ.

In animals provided with numerous coccygeal vertebræ, such vertebræ may be provided with processes and articulations as complex as those of other spinal regions. Transverse processes may be largely developed at the tail root, but almost always thence backwards diminish in extent; sometimes, however, as in the Armadillo (*Chlamydophorus*), they may increase in size backwards from the tail root. Rarely (as, *e.g.*, in *Menobranchus*) caudal vertebræ may be furnished with two ribs supported by both tubercular and capitular processes. Inferior arches may exist in the form of detached "chevron bows" placed beneath the intervals of successive caudal vertebræ, especially towards the tail root. They may be represented by processes or by continuously ossified inferior arches, which may, as in the Flat Fishes, be very prolonged, extending downwards from each centrum as much as the neural arch and spine extend upwards from it.

Birds have generally six or eight, but may have ten, caudal vertebræ, at the end of which is a so-called "ploughshare-bone," consisting of two or more vertebræ anchylosed together.

The caudal region of the Frog is formed in a very peculiar way. It never consists of distinct vertebræ at any time of life, but is formed by the ossification of the membrane which surrounds the notochord, to which two small neural arches become attached. This structure is called the urostyle.

In Fishes (as in the Perch and Stickleback) there may be a urostyle continuous with the centrum of the last vertebra. Such a urostyle, unlike that of the Frog, is very sharply bent upwards. It is very small and inconspicuous. In other Fishes the hinder part of the notochord may (as in the Salmon) remain unossified and only protected by lateral bony plates, but it is still sharply bent upwards. In a few Fishes (as, *e.g.*, *Polypterus*) the hinder end of the spinal column is not bent upwards. In other Fishes again (as in the Sturgeon and many Sharks) the hinder end of the vertebral column gradually tapers and gradually (not suddenly as in the Perch and Salmon) inclines upwards. In the forms in which the hinder end of the vertebral column bends upwards—whether gradually or suddenly—the arches and processes beneath its hinder end exceed in size those on the dorsal side of it, as also do the fin-rays attached to them. Thus it happens that the part of the caudal fin which is on the ventral side of the gradually or suddenly bent-up part of the spinal column more or less greatly exceeds in size the part on the dorsal side. In those Sea Fishes (*e.g.*, the Sturgeon and many Sharks) in which the upward flexion is gradual and manifest, the ventral part of the caudal fin is evidently the larger, and such a tail is called *heterocercal*. In Fishes in which the hinder end of the spinal column is suddenly bent up and of minute size, so that its real condition is disguised, the caudal fin appears symmetrical and as if the parts dorsal and ventral to the end of the spinal column were equal. Such a condition has been named *homocercal*. Those Fishes in which the spinal column ends without turning upwards, and in which the parts of the caudal fin dorsal and ventral to it are really and not only apparently symmetrical, are said to be *diphycercal*.

Sternum.—The breastbone or sternum extends more or less along the middle line of the ventral region of the anterior part of the trunk in all Vertebrates above Fishes, except Serpents and a few other Reptiles.

Almost always it is connected with the more anterior ribs. Its anterior end is distinguished as the manubrium or presternum, and its hinder is called the xiphoid process or xiphisternum—the middle part being the "body" or mesosternum. A sternum may exist without ribs, or without forming any cartilaginous or osseous connexion with ribs, as in the *Amphibia*. The plastron of Chelonians might well be supposed to be a great sternum, more especially as the plate-like ribs are connected with it. It appears, however, that this great complex plate does not really include a sternum.

The before-mentioned threefold division of the sternum is normal in Mammals, and also exists, though more obscurely, in Birds and Reptiles Even in Mammals it is not universal, the manubrium only may be present, as in the Greenland Whale, or the manubrium and xiphisternum without any mesosternum, as in the Dugong

In Tailed Amphibians and the Slow-Worm (*Anguis*) we have a single sternum, which may be mesosternum only, while in many Frogs and Toads we have only the latter and the xiphisternum The manubrium may develop a median keel, as in Bats, the Mole, and Armadillos, or the mesosternum, as in the Tamandua, or the mesosternum and xiphisternum, as in most Birds

The xiphisternum may assume various forms, but attains its maximum development in Birds, where it forms the part of the sternum posterior to the attachment of the ribs, and may consist of a median and four lateral processes, as in the Fowl It bears the greater part of the keel

In the Monotremes there is a median ossicle in front of the manubrium, which is often called the episternum It is really a part of the appendicular skeleton

Ribs —Mammals possess a greater or less number of ribs, which are mostly long, slender, curved bones, extending downwards from the transverse processes or bodies of the vertebræ, the more anterior of them forming a junction with the sternum The part of the skeleton formed by the rib-bearing vertebræ, the ribs, and the sternum is called the thorax In Man (see ANATOMY) there are twelve ribs (on each side of the body), whereof the first seven join the sternum by the intervention of cartilages, and are called "true ribs" The other five, which do not join the sternum, are called "false ribs" Each rib (except the last two on each side) has a double attachment to the spinal column At its proximal end it has a rounded "head" or "capitulum," which articulates with the capitular surface of a dorsal vertebra At a little distance from the capitulum is another rounded articular prominence called the "tubercle" or "tuberculum," which joins a vertebral tubercular surface The part of the rib between the head and the tubercle is called the "neck" At its distal end each rib has attached to it an elongated cartilage called "costal" Those costal cartilages which do not join the sternum either end freely or blend with the costal cartilage next in advance

Frogs and Toads have no ribs, nor can they be said to exist in some Fishes (*e g*, the Chimæra, the Seahorse, the Lamprey and its allies), but in the immense majority of Vertebrates there are cartilaginous or osseous ribs, attached by their proximal ends to the vertebral column, and tending to surround the trunk

All rib-bearing animals have both "true" and "false" ribs, save Serpents, Fishes, and Chelonians, which can have no true ribs since they have no sternum, and Tailed Amphibians, in which, though there is a sternum, no ribs join it There may, however, be but a single pair of true ribs—as in the Whalebone Whales The ribs are exceptionally broad in the Two-toed Anteater, where they overlap one another The number of ribs has already been indicated under the head of "dorsal vertebræ," though in Birds we may have short ribs attached to the cervical vertebræ, and others coming from vertebræ which are generally counted as "sacral" There may be as few as five or six pairs, as in *Amphiuma*, or the numbers may reach 320, as in some Pythons In many Reptiles, as in the Crocodiles, there may be cervical ribs, and there may even be caudal ribs, as in *Menobranchus*

The function of aiding respiration is one which the ribs possess in the higher *Vertebrata*, but quite other purposes may be subserved by them in addition to, or instead of, respiratory action—namely, locomotion, change of form, or bodily protection as armour Thus the ribs may form a solid case for the safe keeping of the parts within, co-operating in this office with other skeletal structures so as to form the "carapace" of Tortoises already noticed Ribs may be the main agents in locomotion, as in Snakes, which glide along by the successive application to the ground of the edges of their ventral scales, which is brought about by the motions of the ribs, the ends of which are connected with the inner surface of such scales In the little flying Lizard *Draco* certain much elongated ribs serve to support a parachute-like flying membrane, and in the Cobra it is certain ribs which sustain its "hood" when distended.

The presence of a distinct "head" and "tubercle" is a general but not constant character, and the head of the ribs may be connected with two vertebræ or only with one vertebra The ribs may bifurcate proximally into two equal diverging branches, one representing the "head" and the other the "tubercle" A small backwardly-projecting structure termed an "uncinate process" may be given off from the ribs and may ossify as a distinct bone, as in most Birds and in the Crocodile

Sometimes (as in Monotremes and many Lizards) a third segment may be intercalated between a rib and its sternal cartilage, and sternal cartilages may be represented by bones, as in Birds and Armadillos In some Lizards the sternal cartilages of opposite ribs are continuous in the mid ventral line There may be no representative of a sternal rib, as in Fishes and Batrachians

Rarely, as in the Crocodile, there may be ventral rib-like structures in the wall of the abdomen, which meet and are attached ventrally, but are "free" at their dorsal ends These cannot, however, be counted as true ribs Fishes have often two series of ribs on each side of the body, and in *Polypterus* some vertebræ may have four ribs on either side In Fishes the ribs may also be in part attached to the neural spines above or to the hæmal spines below the vertebræ

Cranial Skeleton

By the cranial skeleton we mean the skull, or that part of the axial skeleton which serves to shelter the brain (or anterior expanded end of the central part of the nervous system), together with solid structures continuous or more or less directly connected therewith Such a structure exists in every Vertebrate animal, except the *Amphioxus*, which has no brain Nothing of the kind is known to exist in any Ascidian or in any Invertebrate animal,—unless that cartilage of Cuttlefishes which serves as an investment of the nerve centres and a support for the optic and auditory organs may be deemed a true cranial skeleton, since its portions just enumerated make it, as we shall shortly see, very analogous to a true skull

The cranial skeleton is, of course, at first composed entirely of soft mesoblastic tissue, parts of which always become cartilaginous and generally also osseous, while more or less of its structure may remain in the condition of mere membrane The bones which generally, as just said, enter into its framework may arise directly in the membrane or may be preceded by cartilage which ossifies, a circumstance which divides the cranial bones into two categories—"membrane bones" and "cartilage bones"

The cranial skeleton of Vertebrates is made up of three sets of parts —(1) parts devoted to enclosing and protecting the brain, this is the cranium proper, (2) parts sheltering the organs of sense situated in the head—namely the optic, auditory, and olfactory capsules, these skeletal parts consist of the bones, cartilages, and membranes of the orbit, the internal ear, and the nose respectively, or the perioptic, periotic, and perirhinal bones and cartilages, (3) parts continuous or more or less directly

connected with the cranium, and applied to aid nutrition in the form of deglutition or respiration; such skeletal parts are the jaws and arches (or parts of such) behind the jaws known as the hyoidean and branchial arches.

1. *The Cartilaginous Cranial Skeleton.*—This is formed "by a differentiation within the membranous cranium,"[1] and consists of two plates (parachordals) placed one on each side of the anterior part of the notochord, and forming with the latter the floor of the hinder part of the cranium, which part is known as the basilar plate. The cartilaginous auditory capsules are closely united to the outer sides of the basilar plate. From the anterior margin of that plate two bars, called the "trabeculæ," diverge forwards from the anterior end of the notochord, and then approximate, so as to enclose what is known as the pituitary space, and also the floor of the anterior part of the cranium. Thence they advance (generally united) into the nasal or ethmoidal region of the skull, forming a median nasal septum, having a cartilaginous olfactory capsule on each side of it, and developing lateral processes in front of and behind those capsules. Only in the *Cyclostomata* is there a single olfactory capsule instead of a pair. The nature of the parachordals and trabeculæ is disputed, but opinion inclines to regard them as corresponding to the neural arches of the spinal skeleton,—except the part around the notochord, which corresponds with centra in an unsegmented condition.

Upgrowths arise on the outer side of each parachordal, and these meet above and thus form a complete dorsal arch in the hinder or occipital region of the skull. The posterior aperture of this arch is called the occipital foramen, and through it the spinal cord enters the cranium, there to expand and become the brain. Lateral plates arise on each side farther forwards, in the anterior or sphenoidal region of the cranium. But these do not generally ascend enough to unite together dorsally, at least they almost always form but an imperfect roof to the cranial cavity. This cranial aperture may be related to a median, dorsally placed, eye, which probably once existed in all Vertebrates, and still exists in a rudimentary condition in many Lizards.[2] The lateral plates grow together medianly in front, and more or less completely separate the cranial cavity from the ethmoidal region in front of it. Openings are left here and there in the cartilages of the cranial walls for the passage outwards of nerves from the central part of the nervous system; but these openings or foramina will be noticed in describing the osseous cranial skeleton. On each side of the sphenoidal region are the optic cartilaginous capsules, which, however, never become united (as do the others) with the cranium, and therefore are not generally reckoned as parts of the skull. A special median cartilaginous vertical upgrowth from the trabeculæ between these capsules may (as in Teleostean Fishes, Lizards, and Birds) form an interorbital plate beneath the most anterior part of the cranial cavity.

The third category of cranial skeletal parts is generally represented by a series of descending cartilaginous bars (or visceral arcs) on each side of the alimentary canal, running forwards beneath the cranium to terminate at the mouth.

As this lateral region of the head corresponds with the body wall behind it, and shows transitory indications of division (like the body wall behind it) into an inner part or splanchnopleure and an outer part or somatopleure, it is obvious that skeletal structures formed in its inner or outer part may be taken as belonging to different categories. In the *Cyclostomata*, as in the Lamprey, we find cartilaginous bars placed in the somatic division exclusively,—bars which support and externally protect the series of gill-pouches on each side; and parts probably homologous with these somatic bars of the Lamprey are found also in some Sharks.

[1] Balfour, ii. p. 466.

[2] See *Nature* of May 13, 1886, p. 33.

The Cyclostomes also possess complex labial cartilages which support the lips of their suctorial mouths. Representatives of these cartilages are also to be found about the mouths of many Fishes, as well as in the temporary suctorial mouth of the Tadpole; and they still persist in connexion with the olfactory capsules, though in a reduced form, in higher animals.[3] The most important members of the third category of cranial skeletal parts are—(1) the series of cartilaginous arches lying in the splanchnic or inner region of the lateral wall of the head, which arches support the gill-pouches on their inner sides and are known as the branchial arches, and (2) the arches seemingly in series with them, which are more anteriorly placed, and which are known as the hyoidean arches and the jaws.

One or other, or both, of these two sets of arches are well developed in all craniate Vertebrates, except the Cyclostomes, in which there are no true branchial arches, but only a hyoidean and a rudimentary jaw arch. There may be as many as seven branchial arches (*e.g.*, in *Notidanus*), but five are usually present in water-breathing Vertebrates. The hyoidean arch becomes segmented into two noteworthy portions, the upper of which is known as the hyomandibular portion.

The most anterior, or mandibular arch, also becomes segmented into an upper or metapterygoid portion, an inferior or Meckelian portion, and a median or pterygo-quadrate portion, which grows forwards in front of the metapterygoid portion, and forms the foundation of the upper jaw against which the lower jaw (formed from the Meckelian portion) bites.

The thus formed upper and lower jaws may come to be suspended from the cranium in one of three ways. (1) They may depend from the cranium directly, that is, without the intervention of the hyoidean arch; this arrangement is known as autostylic,[4] and exists in all Vertebrates above Fishes, as well as in certain of the latter (*Chimæra* and the *Dipnoi*). (2) They may be suspended by the co-operation of the hyomandibular portion of the hyoidean arch with their own metapterygoid portion; this arrangement is known as amphistylic, and is found in *Notidanus*, *Hexanchus*, and *Ostracion*.[5] (3) They may be suspended exclusively by the hyomandibular portion of the hyoidean arch (to the exclusion of their more proximal portion), as in most Fishes and the Skates—an arrangement known as hyostylic.

2. *The Osseous Cranium.*—The bony skull is formed partly by ossifications of the cartilage of the cartilaginous skull and partly by ossifications of the membranes investing or completing it. The cartilaginous cranium may, as in Elasmobranchs, be covered by a thin calcified layer without becoming ossified. It may, as in the Selachian Ganoids, remain itself quite unossified, and yet become enveloped by membrane bones. In most cases, however, the investment of the cartilaginous cranium by membrane bones is accompanied by a more or less complete ossification of the cartilage itself. In the *Amphibia* the cartilaginous cranium is to a not inconsiderable extent ossified, but the membrane bones which invest it are nevertheless easily separable from it. The most constant ossifications of the cartilaginous cranium are in the occipital region. In the Lepidosiren these are the only ones, a bone being thus formed on each side of the occipital foramen, which bones are known as the exoccipitals.

[3] Balfour, *loc. cit.*, p. 490.

[4] These terms were proposed by Professor Huxley.

[5] Balfour, *loc. cit.*, p. 475.

Many disputes have taken place as to what cranial bones (both cartilage and membrane bones) of one group of animals correspond with those of other groups. Such disputes still exist in certain cases, and it would be unwise to positively assert more than the existence of a general correspondence between the cranial bones of widely different Vertebrates—such, for example, as between Teleostean Fishes and Reptiles or Mammals.

Beneath the occipital foramen the basioccipital bone arises, and it may, as in Birds and Reptiles, develop a posterior prominence which joins with contiguous prominences of the exoccipitals to form a single "condyle" for articulation with the spine. On the other hand, there may be, as in Mammals and Amphibians, two lateral exoccipital condyles unaccompanied by any median basioccipital prominence. In most Fishes we find only a concave articular surface behind the basioccipital, which thus resembles in form the vertebral centra, the anterior posterior surfaces of which are concave. A fourth bone, the supraoccipital, generally bounds the occipital foramen above.

In front of this occipital segment the auditory capsule, on each side, generally ossifies from three centres of ossification, which form the prootic, opisthotic, and epiotic bones respectively. Of these the first is the most constant, and is the only one which ossifies in the Frog. When all three are present, the prootic is anterior in position, the opisthotic inferior and posterior, and the epiotic posterior and superior. Sometimes, as in Fishes, two other supero-external bones may be formed in the auditory capsule, the more anterior of which is the sphenotic and the more posterior the pterotic.

The base of the cranium, in front of the basioccipital, generally ossifies as the basisphenoid, and a depression on its upper surface is known as the sella turcica or pituitary fossa. In front of the basisphenoid there may be, as in Mammals, another azygous bone, the presphenoid. The skull's lateral walls (in front of the auditory capsule) ossify as the alisphenoid and orbitosphenoid on each side, the latter forming the antero-lateral wall of the cranium. The optic capsule or sclerotic may be merely membranous, as in Mammals, or may ossify, as in Birds, but it never forms any solid connexion with the cranial walls.

The olfactory region very often ossifies as a median vertical bone (the mesethmoid) and two lateral ones (the lateral ethmoids or prefrontals). These ethmoidal ossifications may close the cranial cavity anteriorly, or may be altogether anterior to it. The olfactory and presphenoidal region may ossify very exceptionally as one bone. Such a condition we find in the Frog and its allies. These bones vary greatly in different classes of Vertebrates as to the degrees in which they anchylose together or remain distinct, and also as to the order in which those unite which ultimately coalesce. Similar differences occur with respect to the remaining skull bones. Speaking generally, we find the greatest amount of distinctness in the Osseous Fishes, and the greatest amount of coalescence in the class of Birds.

The membrane bones of the cranium are most conspicuous and constant on its roof. In Fishes we find every grade of transition between simple dermal scutes and true subdermal bones of the internal skeleton. Well-developed dermal cranial scutes are to be found in the Sturgeon and some Siluroids. Where the membrane bones still retain the character of dermal plates, those on the dorsal surface of the cranium are usually arranged in a series of longitudinal rows, continuing in the region of the head the rows of dermal scutes of the trunk. The dorsal cranial dermal bones differ in different Fishes as regards arrangement and number as well as size. Owing, however, to their linear arrangements, they usually receive corresponding names, though it is very doubtful whether they can be considered as truly homologous.[1] In most Bony Fishes, as in higher animals, we may generally distinguish in the cranial roof one or two parietals, with an interparietal or upper (or upper part of a) supraoccipital behind the parietals, and a frontal or pair of frontals in front of them. A bone called the squamosal may also form part of the cranial roof, as in Mammals, and may send forwards and outwards a process which unites with another form, a preorbital bone, to form a zygomatic arch. In front, above, behind, and beneath the orbit (in which lies the sclerotic) bones may arise termed malars and lachrymals, supraorbitals, and post-frontals respectively, and the zygomatic process of the squamosal may unite with a corresponding process from the malar or the post-frontal. The malar bone, or (as it is often called) the jugal, rather belongs, however, to the third category of cranial skeletal parts. The olfactory or ethmoidal region becomes roofed over in part by the frontals, in part by the lateral bones (belonging to the third category of cranial parts to be presently noticed) called the maxillæ, but it is mainly roofed over by two bones (sometimes one bone) called nasals, which bound the posterior surface of the external nasal opening on each side of the skull. In Bony Fishes, Amphibians, and Serpents almost the whole cranium is invested below by a large membrane bone called the parasphenoid.

The nervous centres within the cranial cavity send forth nerves through certain definite small apertures or foramina, which show much constancy of position. As a rule, and in the highest class of Vertebrates, the olfactory nerves pass out medianly in front to the ethmoids, between the orbitosphenoids or the membranous parts which may represent them. The optic nerves perforate the orbitosphenoids, but may pass out behind them. In Lizards (*e g*, *Hatteria*, *Anguis*, and many others) an aperture is left in the roof of the skull which is called the "parietal foramen." It serves for the reception of a third and rudimentary eye, the existence of which in Lizards was before referred to in noticing the cartilaginous cranium. It is a structure of great morphological interest. The nerves of the muscles of the eye, as well as the first of the three divisions of the fifth nerve, pass out in the interval between the orbito and ali-sphenoids. The two other divisions of the fifth, as a rule, perforate the alisphenoid, the third the more constantly, the aperture for it being known as the foramen ovale, the less constant aperture for the second branch being called the foramen rotundum. The auditory nerve enters the auditory capsule (whether ossified or not) on its inner side, and does not pass out from it, but the facial nerve both perforates and traverses it. The glossopharyngeal, pneumogastric, and spinal accessory nerves pass out between the auditory capsule and the exoccipital, which latter bone is perforated and traversed by the hypoglossal nerve.

Thus the osseous cranium (apart from the sense-capsules) consists of three arched segments: of these the hindmost is formed by the basi-, ex-, and supra-occipitals, the median by the basisphenoid, alisphenoids, and parietals, and the anterior by the presphenoid, the orbitosphenoid, and the frontals. These have been called "cranial vertebræ," and certainly if the essence of vertebræ consists in their being a series of solid rings, fitted together and enclosing a tract of the nervous centres, then it must be admitted that the cranium—of the highest class of animals at least—is made up of three such vertebræ. Their development, however, is altogether different from that of true vertebræ, and no such resemblance to vertebræ

[1] Balfour, *loc cit*, p 486

is to be detected in the constituent parts of the cartilaginous cranium. Nevertheless it is undeniable that there is a singular secondary and induced resemblance to vertebræ in these ossified skeletal parts.

The osseous condition of the third category of cranial skeletal parts varies extremely in different classes of Vertebrates. The limits of this article are altogether insufficient for more than a brief indication of the main varieties of the cranial structures of any of the three categories, and the reader must refer for details to the descriptions given in the various articles of this work which are devoted to different groups of animals.

The most anterior lateral descending bar or visceral arc is known as the mandibular arch. That part of it which extends forwards and forms the upper jaw presents us with the following ossifications arranged in two rows—one external, the other internal. The external row, proceeding from before backwards, consists of premaxilla, maxilla, jugal (or malar), and very often of a quadratojugal, which latter, when present, is generally in the form of a bar of bone (with an interval between it and the skull), forming, or helping to form, an inferior lateral external arch analogous to the superior lateral arch already noticed as the "zygoma." There may be a pair of premaxillæ, or they may be represented by an azygous bone. The premaxilla, maxilla, and jugal often unite with the anterior outer margins of the nasal, frontal, and lachrymal to form a continuous bony external wall to the anterior part of the skull. The internal row of bones, proceeding again from before backwards, consists of the vomer, palatine, and pterygoid, which, with their fellows of the opposite side (and sometimes with the aid of the parasphenoid), form the bony roof to the mouth, which roof may (as in Mammals and Crocodiles) be a continuous bony partition, or may be but a sort of open bony framework. Besides the pterygoid proper, other ossifications, adjoining it, have been distinguished as the entopterygoid and ectopterygoid.

The lower part of the most anterior lateral visceral arc forms all or part of the lower jaw. In the *Mammalia* it forms the whole of that jaw, and is invested by but a single bone—the dentary. In other Vertebrates it forms but the distal, though greater, part of that jaw, and may be invested, not only by a dentary, but also by bones called angular, subangular, coronoid, and splenial. The jaw is further continued, proximally, by two bones—the articular and the quadrate—which are ossifications of the cartilaginous arc itself. This may, as in Birds and Reptiles, be directly articulated to the cranial wall, or it may be (as in Fishes) suspended therefrom by bones, the highest of which is termed the hyomandibular, which articulates with the ossified auditory capsule. The hyomandibular joins below two other bones, the anterior of which is called the metapterygoid and the posterior the symplectic, to both of which the quadrate is attached. Thus these four bones act as a "suspensorium" for the lower jaw, the joint between which jaw and the suspensorium is placed at the junction of the quadrate and the articular. In Mammals, parts answering to the suspensorium, the quadrate, and the articular form no part of the jaw but are of relatively minute size and are known as certain parts (the auditory ossicles, &c.) of the internal ear,[1] and are protected externally by an ossification called the tympanic bone.

The second lateral descending bar or visceral arc, known as the hyoidean arch, may have its upper part ossified, in union with the preceding arch, as in the bony suspensorium of Fishes just described. On the other hand its upper part may, as in Mammals, be represented only by minute parts of the internal ear,—except the very summit of the arch, which forms the tympanohyal, and is anchylosed to the ossified auditory capsule of the internal ear. In Bony Fishes the hyoidean arch begins to free itself from the suspensorium, as a bone called the stylohyal, which is attached to the preceding or mandibular arch, between the hyomandibular and the symplectic. The arc then continues downwards as the epihyal and ceratohyal, ending below in the basihyal, from which a glossohyal may project forwards and a urohyal backwards. In Fishes certain styliform ossicles termed branchiostegal rays may project backwards from the hyoidean arch, and above them certain membrane bones called opercular bones—the operculum, preoperculum, suboperculum, and interoperculum—are attached above to the hyomandibular, and lie outside the mandibular and hyoidean arches.

In the air-breathing Vertebrates the hyoidean arch may be well developed or very imperfectly so, and concurs with parts belonging to the more posteriorly situated lateral arches to form a complex bone—the os hyoides—as will be further described.

These more posterior lateral arches—the branchial arches—attain their most complex osseous condition in Bony Fishes, which have commonly five of them, not solidly united to the skull above, but connected one with another inferiorly and with the inferior part of the hyoid arch. From below upwards these arches consist generally of a basibranchial, a hypobranchial, a ceratobranchial, an epibranchial, and a pharyngobranchial, but the hindmost arch is less fully and complexly formed.

In air-breathing Vertebrates the already-mentioned os hyoides consists of a central part or "body," to which are attached two pairs of single or jointed processes termed cornua. The anterior pair of cornua (known in human anatomy as the lesser cornua) represent the hyoidean arch, and may contain all its bones, including the "tympanohyal." The posterior pair of cornua (the greater cornua of human anatomy and the thyrohyals of Mammals generally) answer to or represent part of the branchial arches, and may be longer or shorter than the anterior pair of cornua. That they really have this homology is proved by the process of metamorphosis of the Tadpole, which in its early stage has distinct cartilaginous branchial arches that become the posterior cornua of the os hyoides of the adult Frog.

The osseous skull may, its bones remaining distinct, form a very solid whole, and the brain-case may be complete, as in Mammals, or it may be very loosely constructed and largely membranous, as, *e.g.*, in most Lizards. Teeth may be connected with various bones,—most constantly with the dentary, maxillæ, and premaxillæ,—but the palatines, pterygoids, parasphenoid (in *Plethodon*), pharyngobranchials, and even the basioccipital (Carp and Tench), may be dentigerous.

The structure of the skull is so exceedingly complex and varied that it is impossible within the limits of the present article to do more than give the above general indications. For further particulars the reader is referred to the anatomical details which will be found in the several articles of this work which are devoted to the description of different single groups of Vertebrate animals, and especially to the description of the skull of Man in the article ANATOMY.

APPENDICULAR SKELETON

This part of the internal skeleton of Vertebrate animals normally supports two pairs of limbs only, but in one class—that of Fishes—there are azygous structures—the unpaired fins—which, as before said, must be reckoned as belonging to this category. These latter will be more

[1] The exact and precise homologies of these parts seem still to be *sub judice*.

conveniently treated of later. The whole appendicular skeleton may, however, be wanting, as in the Lamprey and in most Serpents.

The Skeleton of the Paired Limbs.—The paired-limb skeleton normally consists of that of an anterior, pectoral, or thoracic pair of limbs and that of a posterior or pelvic pair. In certain species there may be but a single pair of limbs, which may either be the pectoral pair, as, *e.g.*, in the Amphibian genus *Siren*, or the pelvic pair, as in the Reptilian genera *Bipes*, *Lialis*, and *Ophiodes*.

Normally each pair consists of diverging appendages—the limb skeleton proper—attached to a solid structure embracing parts of the trunk, *i.e.*, a limb-root or limb-girdle. A thoracic limb-girdle may exist in a well-developed condition without any limbs attached to it—as in the Slow-Worm (*Anguis*), but there is never a well-developed pelvic girdle without a rudiment of a pelvic limb.

In all Vertebrates above Fishes the limbs are divisible into a main part of the limb—arm or leg,—with a distal part or extremity—"manus" (hand) or "pes" (foot). We sometimes find (as in *Lialis*, *Python*, and *Balæna*) a rudimentary development of the skeleton of the leg without any rudiment of a pes, but we never find any rudimentary development of an arm without any rudiments of a manus. In the paired limb, as we have seen, a limb-girdle may be present without any part of a limb, but no part of the limb skeleton is ever developed without any limb-girdle. Normally the two limb-girdles are attached in a solid manner to the axial skeleton, in different modes.

Normally the pectoral girdle is only thus connected with the axial skeleton by its ventral part, or with the ventral part of that skeleton, *i.e.*, with the sternum, while it ends freely above, being dorsally connected with the axial skeleton only by soft structures. In Fishes, however, it may abut by its dorsal extremities on each side against the neural region of the spinal column, as in *Raia clavata*, or be connected with the head by skeletal structures, as in Bony Fishes, *e.g.*, Perch, Cod, &c.,—having all the time no connexion with the spine by its ventral part.

The pelvic girdle, on the contrary, is normally connected by its dorsal part solidly with the axial skeleton, though, as in Fishes, it may not be at all so connected. It never, however, abuts ventrally against the axial skeleton as does the thoracic girdle.

Appendicular Skeleton of Vertebrates above Fishes.

The paired limbs of all animals above Fishes are formed on one type, and differ greatly from those of the last-mentioned class. It will be convenient to describe first the general condition of the limbs in Mammals, Birds, Reptiles, and Amphibians.

Both the thoracic and pelvic limbs of these animals are divided, as before said, into main parts (arm and leg) and extremity (manus and pes). Each main part is further subdivided into a proximal segment (upper arm and thigh) and a distal segment (fore-arm and lower part of the leg). Each extremity is subdivided into a root portion ("carpus" and "tarsus"), a middle portion ("metacarpus" and "metatarsus"), and a terminal portion known as the digits. Thus the skeleton, *e.g.*, of the hand of Man is composed of—(1) the root part of the hand or the "carpus" (made up of eight small bones); (2) the middle part of the hand or "metacarpus" (made up of five long bones enclosed in the flesh of the palm); and (3) that of the digits, *i.e.*, of the thumb (or "pollex") and of the four fingers, while the great toe (or "hallux") and the four other toes are the "digits" of the pes.

The joints between the proximal and distal segments of the main part of each limb are the elbow and the knee, and these are turned mostly (as in ourselves) in opposite directions. Primitively, however, in all animals and permanently in some (*e.g.*, Tortoises), both these joints are so conditioned as to open inwards—the elbow and knee being both directed outwards—while the palm of the manus and the sole of the pes are also both inwards in the embryo, and in the adult are applied to the ground, the digits of each extremity being directed outwards. This is the position in which the correspondence in structure between the thoracic and pelvic limbs is most obvious, and in it the whole surface of the limbs, which (on account of the muscles there placed) is known as the "extensor" surface, is turned outwards, whereas that known as the "flexor" surface is turned inwards, while the pollex of the manus and the hallux of the pes are both in front of their respective extremities. This primitive condition is altered during the process of development of Man and most air-breathing Vertebrates, the knee becoming bent forwards and the elbow backwards, while the fore-arm is twisted by a movement called "pronation," so as to enable the flexor or palmar surface of the manus to be applied in a direction parallel to that of the flexor or plantar surface of the pes.

In Bats the thigh is turned backwards, so that the knee bends backwards like an elbow. Were it necessary in these animals to apply the sole of the pes to the ground with the digits forwards (as in most animals), then a pronation of the lower leg would be needed in them, similar to the pronation of the fore-arm, which, as above said, takes place in the majority of animals here referred to—air-breathing Vertebrates.

The Thoracic or Pectoral Limb Girdle.—The shoulder girdle normally consists of the following bones or cartilages:—(1) a superior portion, generally a more or less broad plate of bone, called the scapula, the upper part of which may remain cartilaginous and more or less distinguishable as a suprascapula; (2) a posterior inferior portion, named the coracoid, which may or may not be continuous with the scapula, and may have additional parts or subdivisions distinguished as the coracoid proper, precoracoid, and epicoracoid; at the junction of the scapula and coracoid there is a concave articular surface—the glenoid cavity, into which the pectoral limb is articulated; (3) an anterior inferior portion, called the clavicle, which may abut against an azygous median structure known as an interclavicle, the two being distinguished from the other elements of the girdle by being more or less entirely membrane bones.

These structures are found well developed in many Lizards and quite exceptionally in Monotremes amongst Mammals. In them and in Birds, the coracoids are largely developed, while they remain mere processes of the scapula in non-Monotrematous Mammals, and sometimes are quite rudimentary. In such Mammals the pectoral arch is only completed inferiorly by the clavicles which abut against the sternum, but sometimes (as, *e.g.*, in Ungulates) are altogether absent. The "merrythought" of Birds is a clavicular structure. In Amphibians the two halves of the shoulder girdle are each formed of a continuous plate. Some anatomists reckon part of this as representing a clavicle, but this determination is very doubtful.

The Pelvic Girdle.—This girdle, like the former one, normally consists of three parts—one dorsal, the ilium, and two ventral, whereof the more anterior is the pubis and the posterior the ischium, and all these are cartilage bones. The pubis generally meets ventrally its fellow of the opposite side, but not always so. The ischia meet ventrally more rarely. In Birds and certain extinct Reptiles a third element, the post-pubis, intervenes between the ischium (more or less parallel to the latter) and a pubis which may be fully or only rudimentarily developed. At the junction of the ilium and the ventral pelvic elements there is a concave articular surface for the pelvic limb, the acetabulum. An interval between the pubis and ischium of each side is known as the obturator foramen. We find amongst Amphibians there is a peculiar cartilage in the ventral median line in front of the pubis, which has been called the prepubic cartilage.[1] In Marsupials and Monotremes a bone extends forwards in front of each pubis, and these bones are known as the marsupial bones.

The Limbs.—The general condition of these organs and the bones supporting them in Vertebrates above Fishes having already been indicated, it remains but to fill in a few details as to their normal structure and its principal varieties.

A. *Pectoral.*—The bone of the upper arm is called the *humerus*, and is more or less cylindrical in shape, with an expansion at each end. It may, however, be almost as broad as long, as in the Mole and some Cetacea. The lower arm is generally furnished with two bones, the radius and the ulna, placed side by side. The ulna may be more or less abortive, as in Ruminants and Bats, but it may be the larger of the two fore-arm bones, as is the case amongst Birds.

The *carpus* may have its parts more or less permanently cartilaginous, as in some Urodeles and Cetaceans.

Taking the carpus of Man as a type of the ossified carpus (for further details, see ANATOMY), it consists of the eight following short bones arranged in two transverse rows. The proximal row (that next the arm) includes the scaphoides, lunare, cuneiforme, and pisiforme, while the distal row (that next the fingers) comprises the trapezium, trapezoides, magnum, and unciforme—starting, in each enumeration, from the thumb side of the manus. The pisiforme stands out from the rest, and is reckoned as a sesamoid bone.

[1] Balfour, *loc cit.*, p. 499.

or ossification of a tendon, rather than a true carpal ossicle. There may be an analogous sesamoid ossicle on the other side of the wrist (on the side of the scaphoid) even in Apes, and this obtains its maximum in the Mole, where it strengthens and broadens the manus for digging. The true carpal bones may be more numerous or less numerous than in Man. Thus there may be an ossicle—called intermedium or centrale—placed in the mid line between the two rows of carpals, and this may be double, as in *Cryptobranchus* and some Siberian Urodeles. The unciforme may also be represented by two bones, as amongst Chelonians; the pisiforme is often absent, and also the trapezium. The bones of the distal row are the less constant in number and development, and they may coalesce with the metacarpals, as in the Chameleon. Their development is related to that of the digits with which they articulate. All the true proximal carpal ossicles may unite into one bone, as in *Pteropus*, and the whole carpus may be reduced to two distinct bones, as amongst Birds.

The *metacarpus*, when fully developed, consists of five rather long metacarpal bones, as in Man. There may, however, be but two, and these united into what is called a "cannon bone" (as in Sheep, Deer, &c.), or there may be but a single one, as in the Horse,—answering to Man's third metacarpal. They vary in relative size and proportion in different animals, but are most remarkable for their length and slenderness in the Bats, while they are much elongated in the Horse and most Ruminants.

As to the *digits*, there may be but a single one, as in the Horse, or two, as in Ruminants and the Marsupial known as *Chœropus*. There may be three, as in the Rhinoceros, the Proteus, and in *Seps*; or there may be four. The digits are never certainly more than five (except by monstrosity), although in the Ichthyosaurus extra marginal bones along the manus give at least the appearance of more.

When a digit is wanting it is generally the pollex (thumb), as in Spider Monkeys, but it may be the fifth, as in Pterodactyles, or both fourth and fifth may be wanting, as in Birds. The pollex may be more or less opposable to the others, as in Lemurs, most Monkeys, and in Man, or two digits may be opposed to the other three, as in the Chameleon.

The second digit may be greatly reduced, as in the Potto, or the third may be disproportionally slender, as in the Aye-Aye, or thick, as in the Great Armadillo. The digits may be enormously elongated, as in the Bats, or short, as in the Mole and the Land Tortoises. They may be very imperfectly developed, as in Birds. They may be so united by dense tissue as to be quite incapable of separate motion, as in the Cetaceans. The bones of the fingers are called phalanges, and there are always three of them to each digit except the pollex, which has but two in all Mammals with the exception of certain Cetaceans, which have more. There may be as many as fourteen phalanges in one digit in *Globiocephalus*. The proximal row of these bones may become anchylosed to the metacarpals, as in the Three-toed Sloth. In Reptiles the numbers of the phalanges often increase from two in the pollex to five in the fourth digit, as in the Monitor. The abortive manus of Birds has at its best but three digits, with two phalanges to the pollex, three to the index, and one or two to the third digit. The phalanges are very numerous in the Ichthyosaurus and Plesiosaurus.

B. *Pelvic*.—The bone of the thigh is called the *femur*, and is a long bone which varies less in its form and proportion in different animals than does the humerus. It is, however, relatively very short in the Seals, and still shorter in the Ichthyosaurus.

In front of the knee-joint there is generally present a large sesamoid bone known as the knee pan or patella. This, however, may even in Mammals be very small, as in Bats and Seals, or wanting altogether, as in the Wombat.

The leg below the knee is supported by two long bones, the *tibia* and the *fibula*, placed side by side, whereof the former is the more internally situated, the larger generally, and the more constant. The two bones may anchylose together at each end, as in the Armadillos, or they may do so only below or only above; the two bones may be completely fused together, as in the Frog. The tibia may be the only long bone, through the small development of the fibula, as in Ruminants and the Horse. The fibula may be quite styliform, as in Birds, or it may be developed inferiorly but be atrophied at its upper end, as in Bats. It may be represented only by a small ossification outside the lower end of the tibia, as in the Ox, and with this there may exist a styliform rudiment of its upper part, as in the Elk.

The joint by which the foot moves on the leg is situated between the lower end of the leg bones and the tarsus in Mammals and Amphibians. In Birds and Reptiles, however, this joint is placed in the tarsus, the proximal part of which is firmly connected with the leg, while its distal part is firmly connected with the metatarsus.

The *tarsus* of Man consists of seven irregularly shaped, more or less short bones. Of these the astragalus joins the tibia and has the os calcis beneath it and the naviculare in front of it, while the metatarsals are supported (from the great toe outwards) by the internal, middle, and external cuneiform bones and by the cuboides, which is connected with the fourth and fifth metatarsals.

The tarsus may have its parts more or less permanently cartilaginous, as in some Urodeles. The number of its bones, or cartilages, may be as many as nine, as in the Salamander, or be reduced to three, as in *Proteus*, or perhaps to two, as in *Ophiodes*. Two tarsal bones (the os calcis and naviculare) may take the form of long bones, as in *Galago* and especially in *Tarsius*. These two bones and the astragalus may be represented by a single bone, as in many Lizards, or may early unite with the tibia, as in almost all Birds. The astragalus may be represented by two bones, as in Urodeles. It may have an extra ossicle annexed to it, as in the male *Ornithorhynchus* and *Echidna*. Two extra ossicles may be attached to the tibial side of the foot, as in the true Porcupine (*Cercolabes*). The naviculare may anchylose with one of the distal tarsal bones, as in the Ox and Deer, where it unites with the cuboid. The distal bones are less constant than the others, and they may anchylose with the metatarsals, as in Birds, the Chameleon, and the Three-toed Sloth. The cuboid may be represented by two bones, as in certain Urodeles. The internal cuneiforme may be wanting, as in the Ox, or coalesce with the middle one, as in the Horse.

The *metatarsus* when fully developed consists of five rather long metatarsal bones, as in Man, and never of more. There may be but a single developed metatarsal, as in the Horse (the third) and *Chœropus* (the fourth), or two fused together, as in the Sheep, Deer, &c., or three fused together, as in the Jerboa, or four so fused, as in many Birds. There may be but two metatarsals well developed, as in the Hog, or three, as in the Rhinoceros, or four, as in the Dog. They are never enormously elongated like the metacarpals of Bats, but they may all be extremely short, as in Land Tortoises and the Ichthyosaurus.

The *digits* vary in number, as has just been indicated with respect to the metatarsal bones sustaining them.

When one digit is wanting it may be the fifth, as in Birds, or the hallux (first or great toe), as in the Hare. The third and fourth digits may be only functional ones, as in the Ostrich; but the third may abort, leaving only the fourth, as in *Chœropus*, or the fourth, leaving only the third, as in the Horse. The fourth and fifth may be the only functional ones, as in the Kangaroo. The hallux may be opposable to the other digits, as in Monkeys, Lemurs, Opossums, and Phalangers; or the first and fourth digits may be opposed to the second and third, as in Parrots; or the first and second to the third, fourth, and fifth, as in the Chameleon.

The phalanges of the digits are in Man's whole class always three to each digit except the hallux, which (like the pollex) has but two—save in the Orang, where it may have but one phalanx. They may be much more numerous than in Mammals, as in the pes of the Ichthyosaurus and Plesiosaurus. The numbers of the phalanges as we proceed from the first to the fifth digit may be 2, 3, 4, 5, 4, as in Lizards generally, or 1, 2, 3, 3, 2, as in the Salamander, or 2, 2, 3, 4, 3, as in the Frog. In Birds (where the fifth digit is more developed) the numbers of the phalanges, proceeding from the hallux, are mostly 2, 3, 4, 5; but they may be 2, 3, 3, 3, as in the Swifts, or 2, 3, 4, 3, as in the Goatsuckers.

Appendicular Skeleton of Fishes

The Paired Limbs.—Most Fishes possess two pairs of limbs, known as the pectoral and ventral fins, which respectively correspond to the pectoral and pelvic limbs of higher Vertebrates. These limbs are attached to corresponding limb-girdles, whereof the pelvic girdle is always inferior in development and never attains the large relative proportions and fixed position of the pelvic girdle of non-Piscine Vertebrates.

Very often, however, the ventral fins are entirely wanting, and the pectoral fins are sometimes wanting also. In the latter case there is usually present more or less of a pectoral limb-girdle, though it may be, as in *Murænophis*, little more than a filament. In all non-Piscine Vertebrates the right and left limbs are symmetrically and equally developed, but in the Flat Fishes (*Pleuronectidæ*) one pectoral fin may be larger than the other, or one may disappear, as in *Monochirus*.

The situation of the paired limbs is, in Elasmobranchs, Ganoids, and a good many Teleosteans, similar to that they hold in higher Vertebrates, but in some other Teleosteans (such as the Fishes on that account called "thoracic") the ventral fins are placed far forwards so as to come immediately behind the pectoral fins, while in yet other Teleosteans (known on that account as "jugular" Fishes) they are placed even in front of the pectoral fins.

The *pectoral girdle* may consist of a simple cartilaginous arch, as in Elasmobranchs, or it may be composed, as amongst Teleosteans, of two bones meeting ventrally, each being commonly regarded as a clavicle which is continued up dorsally to the skull by the intervention of a supraclavicle and a post-temporal. Besides these there is a cartilaginous element on each side which usually ossifies in two pieces, the upper one of which is reckoned as representing a scapula and the lower one a coracoid. These parts are annexed to the inner side of the clavicle, where also there is sometimes found a styliform bone, more dorsally placed, called the post-clavicle.

The *pelvic girdle* is represented in Elasmobranchs by a transverse

cartilaginous structure formed of two separated or two medianly-united pieces, each of which sometimes, as in *Chimæra* and *Callorhynchus*, shows much resemblance to the innominate bone of higher Vertebrates in that it sends up a process simulating (and probably representing) the iliac element and possesses a sort of obturator foramen. In Osseous Fishes the pelvic girdle is normally represented by two innominate bones medianly joined, each of which may, by rare exception, as in *Lophius*, send up a tall ilium-like process. In no Fish, however, does the pelvis become solidly united with the spinal column. In the cartilaginous Ganoids it is very rudimentary, and each lateral portion (which has a slightly-developed pubic and iliac process) is separated from its fellow on the opposite side, while in *Lepidosiren* there is only a single simple median cartilage with no iliac process.

The skeleton of the *pectoral limb*, or *fin*, of most Elasmobranchs consists of three considerable basal cartilages, placed side by side, articulating with the pectoral arch, and named the propterygium, the mesopterygium, and the metapterygium. Of these the propterygium is proximal or anterior in position. To the distal ends of these are articulated a number of slender elongated more or less segmented radial cartilages, and to the distal portions of these are annexed the horny fin-rays which form the solid supports of the distal portion of the fin.

Sometimes there may be but two and rarely only one basal cartilage, which one must then be considered as representing the whole three condifferentiated. In *Ceratodus* there is a single basal cartilage followed by a series of small cartilages—secondary radial cartilages diverging from both sides of that series and having fin-rays annexed to them. In *Lepidosiren* the limb skeleton is still more simplified, consisting only of a single series of short slender cartilages with small fin-rays attached to one side alone, without the intervention of any radial cartilages.

In some Bony Fishes (*e g*, *Polypterus*) the basal cartilages are more or less ossified, as are also most of the radials next them, while to these small cartilaginous radials are annexed, which support ossified fin-rays. In some other Ganoids certain of the radial cartilages articulate directly with the pectoral arch. In the *Teleostei* a few, not above five, more or less ossified cartilages lie side by side and articulate with the pectoral arch, and one or more rows of small cartilages succeed to them. These two elements represent the basal and radial cartilages of Elasmobranchs, and to them are articulated the relatively large fin-rays which make up the far greater part of the Teleostean pectoral limbs.

The skeleton of the *ventral fin* or *pelvic limb* is almost always more simple than that of the pectoral one. Only very rarely, as in *Ceratodus*, *Lepidosiren*, and *Callorhynchus antarcticus* (see *Trans Zool Soc*, vol x p 455, and plate lxxix figs 3 and 4), have they a close, or pretty close, resemblance. Generally the Elasmobranch ventral limb is supported by an elongated cartilage, the basipterygium, which articulates with the pelvic cartilages and bears on its ventral border a series of cartilaginous radialia with which the fin-rays are connected. In *Polyodon folium* there are only radials which support fin-rays but are not themselves supported by any basipterygium, nor is there any pelvic cartilage. In the *Teleostei* the fin-rays are directly attached to the osseous pelvic elements.

The Unpaired Appendicular Elements.—Besides the two pairs of limbs there are, as has been mentioned, certain azygous structures commonly known as the unpaired or azygous fins or limbs. They are only found in Fishes, and consist of the dorsal, caudal, and anal fins. These may all run one into the other and form a continuous fin fringe to the body from the head round the tail and forward again to the vent, as in Eels and many Gadoid and Blennioid Fishes. In most cases, however, there are one or two distinct dorsal fins, and an anal fin also distinct from the caudal one.

The structure of the *dorsal fin* in Elasmobranchs is singularly like that of their paired fins, inasmuch as it is supported by an elongated or segmented basal cartilage or cartilages, from the dorsal margin of which radial cartilages (generally elongated, slender, and segmented) proceed, having the fin-rays connected with them distally. The basal cartilages may or may not be directly connected or become confluent with the subjacent spinal skeleton. There may be (as in the second dorsal of *Callorhynchus antarcticus*) but a single longitudinal series of more or less elongated cartilages side by side, like radial cartilages devoid of any subjacent basal cartilages. In the *Teleostei* the fin-rays may be osseous and in the form of more or less strong spines, or soft and of a horn-like consistency, and segmented both vertically and horizontally, and fin-rays generally consist of two (right and left) halves, which, although closely applied together for the greater part of their length, diverge proximally to embrace the skeletal element to which they are annexed. These latter elements in the *Teleostei* are small ossicles or chondrifications, termed "interspinous bones or cartilages." They extend upwards between the neural spines of the axial skeleton and the dorsal surface of the body.

Anal fins are essentially similar in composition to dorsal fins.

The *caudal fin* is modified according to the condition of the posterior termination of the axial skeleton, the different condition of which in Fishes has already been noticed (p 112). Much-modified axial elements generally form the support of the fin rays, but the numerous complex and varied conditions which these parts may present in different forms is a matter of ichthyology, which can hardly find a place in a general description of the Vertebrate skeleton.

Nature and Origin of Appendicular Skeletal Parts.—From the researches of the late Prof Balfour it appears that the paired limbs arise as differentiations of continuous lateral folds or projections from the surface of the body, and the azygous fins arise as differentiated projections from its dorsal and ventral surfaces. Thus all these appendicular parts may be viewed as different species of one fundamental set of parts (pterygia), for the sum total of which the term "sympterygium" has been proposed (see *Trans Zool Soc*, vol x pp 481, 482). The paired limbs and azygous fins are of similar origin and nature. Separate narrow solid supports, in longitudinal series, and with their long axes directed more or less at right angles with the long axis of the body, were developed in varying extent in all these four folds or projections. These supports have, it would appear, very often united to form basal cartilages, the original single and united condition persisting in such forms as the ventral fin of *Polyodon* and the second dorsal of *Callorhynchus*, both already noticed.

The paired limbs are thus, in all probability, essentially peripheral structures which have become more or less closely connected with the axial skeleton. Their proximal parts uniting and growing inwards have often become directly connected with parts of the axial skeleton. Thus the limb-girdles seem to have arisen,—namely, as ingrowths from the basal cartilages of the limbs, and therefore the whole appendicular skeleton belongs to a different skeletal category from that of the head and spinal column or axial endoskeleton.

SKELTON, JOHN, an eccentric English scholar and poet of the 15th century. Mr Dyce, the editor of his works, fixes his birth about 1460. His first essay in verse was a poem after the manner of Lydgate on the death of Edward IV (1483). He lived to pay compliments to Catherine, wife of Henry VIII, to jeer at the Scotch over the battle of Flodden, and to make fierce attacks on Wolsey, and is supposed to have died in 1529. In general intellectual force, fierceness of invective, wildness of buffoonery, and coarseness of language Skelton bears some likeness to Swift. But he stands by himself as one of the most eccentric and paradoxical characters in English literature. He began life apparently as the protegé of a pious, learned, and literary lady, the mother of Henry VII, who founded St John's College and Christ's College, Cambridge, and translated devotional works from the French. He was himself one of the most notable scholars of his time, was appointed tutor to Henry VIII, was

hailed by Erasmus (whether *ex officio* or *propter merita* is left to conjecture) as "unum literarum Britannarum lumen et decus," was proclaimed *poeta laureatus* by both universities, and frequently applied this title as well as that of *orator regius* to himself without challenge. At about the age of forty he took orders, and was appointed rector of Diss in Norfolk, where he seems to have spent the last twenty-five years of his life. Yet this eminent scholar and churchman is the author of the oldest and the best drinking song in the English language—the drinking song in *Gammer Gurton's Needle*, and of one of the coarsest poems in any language—*The Tunning of Elinor Rumming*. He is the author of a satire against the clergy of his time—*Colin Clout*,—unsurpassed in pre-Reformation literature for direct and merciless ridicule, and of a satire against the great cardinal when at the height of his greatness—*Why come ye not to Court?*—boiling over with ferocious invective and insolent contempt. At the same time he had such a repute for rough wit and irregularity of life that he became the hero of a book of "merry tales." These mythical tales were probably in the mind of the historian who has described Skelton as a "ribald buffoon," "a profligate and ill-living wretch." Whether the real Skelton deserved such epithets is doubtful; his verse undoubtedly contains much that may fairly be described as ribaldry and buffoonery. It has not a trace of the chivalrous spirit of Chaucer, and his most characteristic form, known as Skeltonical verse, is wayward and unconventional—adopted as if in mad defiance of regular metre. Still, as Skelton himself claimed for it, "it has in it some pith."

"Though my ryme be ragged,
Tattered, and jagged,
Rudely rain beaten,
Rusty and moth-eaten,
If ye take well therewith
It hath in it some pith."

Colin Clout, *Why come ye not to Court?* and *The Book of Philip Sparrow*—which Coleridge pronounced "an exquisite and original poem"—are written in this metre. *The Bowge* (ship) *of Court*, a satirical vision of personified abstractions, is more conventional in form, and was probably one of his earlier works. Both it and his interlude *Magnificence* show great power in the vivid description of character.

SKIMMER, the English name bestowed by Pennant[1] in 1781 on a North-American bird which had already been figured and described by Catesby (*B. Carolina*, i. pl. 90) as the "Cut-water,"—as it appears still to be called on some parts of the coast,[2]—remarkable for the unique formation of its bill, in which the maxilla, or so-called upper mandible, is capable of much vertical movement, while the lower mandible, which is considerably the longer of the two, is laterally compressed so as to be as thin as a knife-blade. This bird is the *Rhynchops nigra* of Linnæus, who, however, united with it what proves to be an allied species from India that, having been indicated many years before by Petiver (*Gazoph. Naturæ*, tab. 76, fig. 2), on the authority of Buckley, was only technically named and described in 1838 by Swainson (*Anim. Menageries*, p. 360) as *R. albicollis*. A third species, *R. flavirostris*, inhabits Africa; and examples from South America, though by many writers regarded as identical with *R. nigra*, are considered by Mr Saunders (*Proc. Zool. Society*, 1882, p. 522) to form a fourth, the *R. melanura* of Swainson (*ut supra*, p. 340). All these resemble one another very closely, and, apart from their singularly-formed bill, have the structure and appearance of TERNS (*q.v.*). Some authors make a family of the genus *Rhynchops*, but it seems needless to remove it from the *Laridæ* (GULL, vol. xi. p. 274). In breeding-habits the Skimmers thoroughly agree with the Terns, the largest species of which group they nearly equal in size, and indeed only seem to differ from them in the mode of taking their food, which of course is correlated with the extraordinary formation of their bill. (A. N.)

[1] "I call it *Skimmer*, from the manner of its collecting its food with the lower mandible, as it flies along the surface of the water" (*Gen. of Birds*, p. 52).

[2] Other English names applied to it in America are "Razorbill," "Scissorbill," and "Shearwater."

SKIN DISEASES. These form a large and important class. In number they are very extensive, owing to the varied forms of morbid change which the skin texture may undergo, no less than to the different portions of the structure and its appendages which may be specially affected. Further, the modifications of the typical forms of these diseases which are to be observed have led to arrangements and classifications of very complex character and multiplied greatly their nomenclature. Skin diseases are regarded by the physician as of great importance, not only from the fact that morbid action in this texture must have a powerful influence on the general health and may bring in its train other maladies, but also because they are not unfrequently themselves the expression of constitutional conditions, inherited or acquired, the recognition of which is essential to their effectual treatment. In order to clearness of description it is necessary to make use of some method of classification. Various arrangements have been adopted by writers on the subject, but the following appears sufficient for the present purpose[3]:—

I. Disorders of the secreting apparatus (of the sebaceous and sweat glands);

II. Disorders specially relating to nutrition (hypertrophies, atrophies, new formations, pigmentary changes);

III. Inflammatory affections (erythematous, papular, vesicular, pustular, squamous or scaly);

IV. Neuroses (nervous disorders);

V. Parasitic affections (animal, vegetable).

I. DISORDERS OF THE SECRETING APPARATUS.—(1) *Of the Sweat Glands.*—The chief morbid conditions are excessive sweating (*hyperidrosis*) and fœtid sweating (*bromidrosis*). Excessive sweating is a symptom observed in various diseases, such as phthisis and rheumatic fever, but it may exist apart from such conditions, and either be general, affecting the whole body, or confined to a part, such as the axillæ, head, hands, feet, or, as in some rare instances, the one half of the body. Some persons habitually perspire, often to a great extent, on making any effort, yet never appear to suffer in health, although the discomfort is considerable. Excessive perspiration may often be prevented by the habitual use of the cold bath, and by tonics, such as iron, quinine, strychnia, &c. Locally, the use of astringent lotions of vinegar or a weak solution of lead will also be of service. Bromidrosis or fœtid sweating is often associated with the former condition, and it too may be general or local. It most frequently affects the feet, especially in those who have much fatigue, and is a source of much personal discomfort as well as of annoyance to others. It is apparently due to rapid decomposition in the perspiration which has saturated the stockings, and for its treatment it is essential that these should be frequently changed and the feet washed several times a day, dried carefully, and dusted with some antiseptic powder, such as boracic or salicylic acid mixed with starch or French chalk. Hebra recommends the application to the feet of a composition of equal parts of olive oil and litharge plaster spread upon linen and used twice a day.

(2) *Of the Sebaceous Glands.*—*Seborrhœa* is a term

[3] For the structure of the skin see ANATOMY, vol. i. p. 897.

applied to describe an accumulation on the skin of the normal sebaceous secretion mixed up with dirt and forming scales or a distinct incrustation On the head, where it is commonly seen, it may interfere with the nutrition of the hair and cause partial baldness A form of this disease occurs in young infants The main treatment is local, consisting in thorough cleansing of the parts The crusts may be softened with oil and the affected skin regularly washed with soft soap and rectified spirit The sebum frequently accumulates in the sebaceous ducts, giving rise to the minute black points so often noticed on the face, back, and chest in young adults, to which the term *comedones* is applied A form of this disorder, but of larger size and white appearance, is termed *milium* These affections may to a large extent be prevented by strict attention to ablution and brisk friction of the skin, which will also often remove them when they begin to appear The retained secretion may be squeezed out or evacuated by incision and the skin treated with some simple sulphur application

Acne is an eruption produced by inflammation of the sebaceous glands and hair follicles It may occur in connexion with the preceding or independently, and shows itself in the form of red pimples or papules which may become pustular and be attended with considerable surrounding irritation of the skin This affection is likewise most common in early adult life, and occurs on the chest and back as well as on the face, where it may, when of much extent, produce considerable disfigurement It is apt to persist for months or even years, but usually in time disappears entirely, although slight traces may remain in the form of scars or stains upon the skin Eruptions of this kind are sometimes produced by the continued internal use of certain drugs, such as the iodide or bromide of potassium The treatment is similar to that for the previous affection, viz, brisk friction of the skin, short of producing irritation, and the application of a sulphur lotion or ointment Attention to the general health by suitable diet, tonics, exercise, &c, is a necessary adjuvant A variety of this malady, to which the name *acne rosacea* is given, is a more severe and troublesome disorder than that already mentioned It is characterized by great redness of the nose and cheeks, accompanied with nodular enlargements on the surface of the skin, which produce marked disfigurement Although often seen in persons who live too freely, it is by no means confined to such, but may arise in connexion with disturbances of the general health, especially of the function of digestion, and in females with menstrual disorders It is apt to be exceedingly intractable to treatment, which is here too, as in the preceding form, partly local and partly constitutional Of internal remedies preparations of iodine and of arsenic are sometimes found of service

Molluscum contagiosum belongs to this class of skin diseases It consists of an enlargement of the sebaceous glands and occlusion of the ducts, and is seen most commonly on the face, body, or hands in children, or on the breasts in women It is said to be contagious, but it is a rare form of skin disease

II DISORDERS AFFECTING NUTRITION —(1) *Hypertrophies* —A *corn* (*clavus*) is a local thickening of the skin, generally occurring on the toes There is hypertrophy of the epidermis, and in the centre of the corn there is usually a still denser mass, which, pressing down upon the subjacent sensitive true skin, causes pain and may give rise to inflammation and suppuration in the part When situated between the toes the corn is softer than when on the free surface of the foot The treatment consists in maceration of the hardened skin and the use of the knife or strong caustics Salicylic acid combined with ether and collodion, painted over the part, is said to be useful in the case of soft corns

A *wart* (*verruca*) is an excrescence from the surface of the skin due to hypertrophy of the papillary layer of the cutis and of the epidermis This form of growth may also occur on mucous membranes Warts occasionally disappear spontaneously, or they may be excised, or carefully touched with some strong caustic acid or alkali

Ichthyosis or *xeroderma* consists of a general thickening of the whole skin and marked accumulation of the epidermic elements, with atrophy of the sebaceous glands, giving rise to a hard, dry, scaly condition It generally first appears in infancy, and is probably congenital It differs in intensity and in distribution in different cases, and is generally little amenable to any but palliative remedies, such as the regular application of oily substances, although it is not a fatal malady

For *elephantiasis Arabum*, see vol viii p 126.

(2) *Atrophies* —The chief of these relate to the hair *Canities* or whitening of the hair consists in the non-formation of the pigmentary matter which is normally present in the substance of the hair, and occurs generally as a slow senile change It may, however, take place prematurely, in which case it is often hereditary, or it may be associated with degenerative changes taking place in the system It is occasionally seen to occur temporarily in very young persons in connexion with some defective condition of the general health Its development suddenly has not unfrequently been observed as the result of some strong mental emotion

Alopecia, or baldness, is the loss of hair, which is most commonly a senile change and irremediable, or on the other hand may be premature, occurring either hereditarily or in connexion with some previous constitutional morbid state (*e g*, after fevers or other blood poisons), in which latter case it may be only, although not always, temporary It appears to depend upon atrophic changes affecting the hair follicle, including obliteration of the capillary vessels,—the result of which is that strong hairs cease to be produced, and only feeble, short, and thin hair (*lanugo*) is formed, which soon falls off and is not reproduced Usually the whole skin of the hairy scalp undergoes thinning and other atrophic changes as well as the hair follicle Sometimes the loss of hair occurs in distinct circular patches (*alopecia areata*), which tend to spread until the whole scalp is denuded The treatment of temporary or premature baldness bears reference especially to any known conditions affecting the general health, and tonics, baths, and other means to promote a vigorous skin function are useful Stimulating liniments containing spirits and cantharides, the regular cleansing and moderate brushing of the parts, the application to the scalp of the constant current of electricity, and various other remedies appear to be of service in promoting the growth of hair

(3) *New Formations* —(*a*) *Lupus* is a disease characterized by the formation in the skin of tubercles or nodules consisting of new cell growth which has no tendency to further development, but to retrograde change, leading to ulceration and destruction of the skin and other tissues in which it exists, and the subsequent formation of permanent white scars *Lupus vulgaris* is most commonly seen in early life, and occurs chiefly on the face, about the nose, cheeks, ears, &c, but it may also affect the skin of the body or limbs It first shows itself in the form of small, slightly prominent nodules covered with thin crusts or scabs These may be absorbed and removed at one point, but they tend to spread at another Their disappearance is followed by a white permanent cicatrix The disease may be superficial in which case both the

ulceration and resulting scar are slight (*lupus non-exedens*), or, on the other hand, the ulcerative process may be deep and extensive, destroying a large portion of the tissues of the nose or cheeks, and leaving deep marks with much disfigurement (*lupus exedens*) Another form of this disease, termed *lupus erythematosus*, is of comparatively mild character, and occurs on the nose and adjacent portions of the cheeks in the form of red patches covered with thin scales, underneath which are seen the widened openings of the sebaceous ducts,—this variety of the disease affecting specially that portion of the skin texture It is very slow in disappearing, but does not leave any marked scar Lupus is generally more frequently seen in women than in men, and it is held to be connected with a scrofulous constitution Its treatment bears reference especially to this condition (see SCROFULA) In the superficial variety the application of soothing ointments when there is much redness, and Squire's method of slight linear incisions to destroy the increased blood supply, are often serviceable In the ordinary form the great principle of local treatment is to remove the new tissue growth This is most readily done either by solid points of caustic, of which the nitrate of silver is perhaps the best, thrust into the tubercles to break them up, or by means of a scoop (Volkmann's spoon) to scrape away the diseased masses Only by such means can the ulceration be arrested and healing brought about

(*b*) *Leprosy* (*elephantiasis Græcorum*) may be regarded as belonging to this class of skin diseases, inasmuch as it consists in a new growth of cell material, like lupus, but with less tendency to disintegration and with a wider distribution affecting the skin, mucous membranes, nerves, &c, all over the body For its history and pathology see vol XIV p 468 *sq* Leprosy is not amenable to treatment, beyond attempts at palliation of the symptoms and by general hygiene

(4) *Pigmentary Changes*—*Chloasma* is an abnormal pigmentation, in the form of brown patches, either generally diffused or confined to one part, such as the forehead and face, and occasionally seen in women suffering from uterine ailments *Addison's disease* is connected with a morbid condition of the suprarenal capsules (see PATHOLOGY), and is accompanied with general bronzing of the skin, together with anæmia and great and increasing prostration *Leucoderma* is a change in the pigmentation of the skin, whereby it becomes white in patches, with a tendency to spread and affect almost the whole surface, until a few dark areas alone remain to represent the original appearance of the skin It is sometimes called white leprosy, but has no relation to that disease, nor is it of any special significance as regards the health *Albinism* is an entire absence of pigment from the hair, skin, eyes, &c The hair is usually white, and the skin exceedingly pale, and the eye has a pinkish appearance This condition is congenital It occasionally exists to a partial extent in any of the textures named

III. INFLAMMATORY SKIN AFFECTIONS —These embrace the following chief varieties —(1) diffuse (erythema), (2) papular (lichen), (3) catarrhal (eczema), (4) vesicular (herpes, pemphigus), (5) pustular (impetigo), and (6) scaly (psoriasis, pityriasis)

(1) *Diffuse*—This variety includes *erythema* (see ERYSIPELAS) and its forms, particularly *erythema nodosum*, which consists of spots and patches of dark red colour and slightly elevated, appearing on the front of the legs and back of the arms in young persons, mostly females The patches continue for a number of days and then become fainter It is supposed to be connected with rheumatism, joint pains not unfrequently accompanying it *Urticaria* or *nettle-rash* is a diffuse redness of the skin, accompanied with wheals of raised and paler appearance, not unlike the effect produced by the sting of nettles or of insects, and attended with great irritation and itching Certain kinds of food, such as fruit and fish, produce this eruption in some persons, as also some drugs, such as opium It is best treated by some soothing application, such as a solution of sal volatile, to which a little chloral has been added, and by attention to the state of the alimentary canal *Roseola*, which consists in the appearance of rose-coloured spots upon the body, is frequently seen in children, and is apt to be mistaken for measles, but has none of the accompanying febrile or catarrhal symptoms of that disorder, and is of brief duration

(2) *Papular*—*Lichen*, an eruption consisting of small, thickly-set, and slightly-elevated red points, more or less widely distributed over the body, and in the young somewhat resembling scarlet fever, but with only slight febrile symptoms and no sore throat, usually results from digestive derangements, but apparently may also arise from exposure to the sun, and it lasts but a short time Some forms, however (*e g*, *lichen ruber*), are of chronic character and difficult of treatment The ordinary form requires little beyond attention to the digestive organs and the application of a soothing lotion or powder The chronic forms are best treated by the administration of arsenic *Strophulus*, or tooth-rash, or, as it is popularly termed, "red gum," an affection very common in young infants, belongs to this class of skin disorders

(3) *Catarrhal*—*Eczema*, one of the most common and important of all skin diseases, consists of an inflammation of the true skin, of catarrhal character, together with the formation of papules, vesicles, or pustules, attended with more or less discharge, and with itching and other symptoms of irritation It may be either acute or chronic, and presents itself in a variety of forms As regards causation, it appears impossible to assign any one condition as giving rise to this disease It occurs frequently in persons to all appearance in perfect health, and it may in such cases be a permanent or recurring affection during a whole lifetime Again it is undoubtedly found in persons who possess a morbid constitution, such as the gouty or scrofulous, but apart from any such evident associations it seems in some instances itself distinctly hereditary Sometimes it is set up as the result of local or general irritation of the skin in certain occupations, and it may exist in connexion with the presence of some other skin disease It is much more common in men than in women Numerous varieties of eczema are described, according to its site and duration, only the more important of these can be alluded to *Acute eczema* shows itself by redness and swelling of the skin, with the formation of minute vesicles, and attended with severe heat and irritation Should the vesicles rupture, a raw moist surface is formed, from which a colourless discharge oozes, which when it accumulates forms thin crusts The attack may be general over the greater portion of the body, or it may be entirely localized to a limb or other part It usually lasts for a few weeks and then passes off, leaving, however, a liability to recurrence Such attacks may occur as a result of digestive derangements, or in persons of rheumatic or gouty habit, and they tend to appear at certain seasons, such as springtime They are usually best treated by attention to the general health, and by a simple and carefully-regulated diet, while locally some soothing application, such as a weak lead lotion or a dusting powder of zinc, starch, or boracic acid, will be found of benefit. *Chronic eczema* shows itself in various forms, of which we note the most common In *eczema rubrum* the disease affects a part, very often a limb, as a severe form of inflammation, with great redness, and weeping or oozing

of serous matter from the raw surface. It gives rise to great irritation and pain, and may cause considerable disturbance of the general health. It may last for years, with intervals of partial recovery, but easily recurring. The skin of the limb becomes in time thickened and the limb itself much swollen. In *dry eczema* the skin, though irritable, remains dry and scaly. In *pustular eczema*, or *eczema impetiginodes*, in addition to the cutaneous inflammation there occur pustules which break and the purulent matter forms yellow crusts upon the skin. This form is very common on the heads of young children during the period of dentition. The treatment of chronic eczema depends in great measure upon the form it assumes. Where there exists much irritation, soothing lotions or applications similar to those required for acute eczema are necessary, but where irritation has subsided, stimulating ointments, such as those of zinc or white precipitate, are often of service. Constitutional remedies, such as iron, arsenic, &c, are an important and often essential part of successful treatment.

(4) *Vesicular.—Herpes* is an inflammation of the true skin, attended with the formation of isolated or grouped vesicles of various sizes upon a reddened base. They contain a clear fluid, and either rupture or dry up. Two well-marked varieties of herpes are frequently met with. (*a*) In *herpes labialis et nasalis* the eruption occurs about the lips and nose. It is seen in cases of certain acute febrile ailments, such as fevers, inflammation of the lungs, or even in a severe cold. It soon passes off. (*b*) In *herpes zoster*, zona, or shingles, the eruption occurs in the course of one or more cutaneous nerves, often on one side of the trunk, but it may be on the face, limbs, or other parts. It may occur at any age, but is probably more frequently met with in elderly people. The appearance of the eruption is usually preceded by severe stinging neuralgic pains for several days, and, not only during the continuance of the herpetic spots, but long after they have dried up and disappeared, these pains sometimes continue and give rise to great suffering. The disease seldom recurs. The most that can be done for its relief is to protect the parts with cotton wool or some dusting powder, while the pain may be allayed by opiates or bromide of potassium. Quinine internally is often of service.

Pemphigus consists in large blebs upon a red base. They contain clear or yellowish fluid. This disease appears to show itself most frequently on the bodies and limbs of unhealthy or neglected children. The blebs give rise to much irritation, and when they burst leave raw ulcerated surfaces which are slow of healing. One variety of this malady (*pemphigus foliaceus*) affects the entire skin of the body, from which there exudes a constant discharge. This form is apt sooner or later to prove fatal from its exhausting effects. The treatment is mainly constitutional,—by good nourishment, iron, &c.

(5) *Pustular.—Impetigo*, consisting of small pustules situated upon a reddened base, mostly occurs in children. There appears to be a contagious form of this malady. *Ecthyma* consists of large pustules of similar character on the body and limbs. The treatment of these ailments requires special attention to nutrition, since they usually occur in low states of health.

(6) *Squamous or Scaly.—Psoriasis*, an inflammatory affection of the true skin, attended with the formation of red spots or patches, which are covered with white silvery scales, may affect any portion of the surface of the body, but is most common about the elbows and knees, and on the head. There is as a rule comparatively little irritation except at the outset, but there is an extensive shedding of the scales from the affected spots. Varieties of this disease are described in relation to the size and distribution of the patches. The causes of psoriasis have given rise to much discussion, and, while some authorities regard its appearance as in many instances connected with some constitutional morbid state, such as gout, rheumatism, &c, the majority deny any such relationship, and mention hereditary influence as the only recognizable cause, although it must be admitted that even this evidence is wanting in a large number of cases. The disease appears to be consistent with continued good health. It is usually obstinate to treat, and may, with intervals of comparative immunity, last a lifetime. The remedies most serviceable are arsenic internally and the application externally of preparations of tar. Recently the employment of chrysophanic acid as an ointment or in solution has been resorted to with considerable success.

Pityriasis, a superficial inflammation of the skin, with the formation of minute branny scales, occurs most commonly on the head, and is of chronic duration. The remedies most useful are alkaline lotions and tar preparations. A variety of this disease (*pityriasis rubra*) affects the whole body, and is most intractable to treatment.

IV. Neuroses (*Nervous Affections*).—Various disorders of nutrition of the skin occur in persons suffering from organic nervous diseases, such as bedsores, atrophic changes, eruptions, &c, but these belong to the symptoms of the several diseases with which they are associated. The most common of the neuroses of the skin is probably *pruritus*, which is an ailment characterized by intense itching of the surface of the body. It may occur in connexion with other morbid conditions, such as jaundice, diabetes, digestive disorders, &c, or as the result of the irritation produced by lice or other skin parasites. The most serious form is *pruritus senilis*, which affects old persons, and is often a cause of great suffering, depriving the patient of sleep (the malady being specially troublesome during the night). In such cases it is probably due to atrophic changes in the skin. No eruption is visible, except such marks as are produced by scratching. The treatment consists in the removal of any apparent cause, and measures to strengthen the system, such as the use of quinine, iron, &c. Soothing lotions composed of solutions of alkalis conjoined with chloral, opium, hydrocyanic acid, &c, may be applied to the affected skin at bedtime.

V. Parasitic Diseases.—(1) *Animal.*—The following are the chief animal parasitic diseases. *Phthiriasis* is produced by the presence of lice (*pediculi*), of which there are three varieties, infesting respectively the head, body, and pubis. The cause is in most instances uncleanliness, but occasionally in the aged, and in persons suffering from chronic diseases, there appears to be a liability to the development of pediculi, notwithstanding every care to prevent it. The irritation produced by the parasite and the scratching thus occasioned may give rise to abrasions of the skin and eczematous conditions. The treatment consists in thorough cleansing of the parts and the use of parasiticides, such as red or white precipitate, carbolic lotions (one in twenty), or a decoction or ointment of stavesacre. Where clothing is infested it should be destroyed or subjected to a strong heat to get rid both of the parasites and their ova. *Scabies* or *itch* is a skin affection due to the *Acarus scabiei* (see Mite). The female insects burrow into the upper layers of the skin and deposit their eggs in the tract thus made. Great irritation of the skin is set up, and scratching produces eruptions which aggravate the condition, especially at night. The most frequent sites are the parts between the fingers, or the wrists, but by scratching the disease may be conveyed to any part of the body, and in extreme cases the greater portion of the surface of the trunk and limbs may be involved. In infants the feet and buttocks

are the parts which suffer The eruption in mild cases has at first the appearance of small raised vesicles with clear fluid, but it may become pustular or eczematous, and extensive excoriations may result The treatment consists in thorough cleansing of the skin and the inunction of some form of parasiticide,—sulphur ointment being on the whole the best The application should be discontinued after a few days, otherwise irritation may be produced by its use

(2) *Vegetable parasites* consist of fungous growths in the texture of the skin and hair, which are characterized microscopically by minute round bodies or spores often coalesced into clusters or bead-like arrangements, and jointed filaments or *mycelium* of elongate and branching form They are readily detected by removing a hair, or scraping a portion of the affected skin, treating it with a strong alkaline solution, and submitting it to microscopic examination, by which the slight differences in form and arrangement of the varieties of the parasite can be easily made out The common name "tinea" is applied to these parasitic affections *Tinea tonsurans*, or *ringworm* (parasite *Trichophyton tonsurans*), is a very common form of parasitic disease It occurs as a result of contagion in the heads of children, and begins as circular patches with a scaly appearance and red border, which tend to spread The hair at the part becomes thin and brittle and is easily removed It is often extremely obstinate to treatment, and numerous agents have been proposed as specifics, not one of which, however, appears to possess infallible virtues Among the best are oleate of mercury (5 to 10 per cent) and other mercurial preparations, all which, however, must be used with care, and carbolic or sulphurous acid with glycerin, iodine, cantharides, &c, but isolation of the patient as far as possible, together with strict medical supervision, are essential for the effectual treatment of this disorder *Tinea sycosis*, or ringworm affecting the beard, and *tinea circinata*, or ringworm affecting the body, require to be dealt with in a similar manner *Tinea favosa*, or *favus* (parasite *Achorion Schonleinii*), is less frequently seen than the preceding It occurs mostly on the scalp in unhealthy and neglected children, but it may affect the skin in any part of the body It is characterized by round, yellow, sulphur-coloured, cup-shaped spots or crusts, which, when occurring extensively upon the scalp, have a peculiar mousy odour It is very destructive of hair growth, and is most difficult to cure The best treatment is removal of the hairs by epilation, and the employment of some of the parasiticides already mentioned, together with attention to the healthy nutrition of the patient. *Tinea versicolor*, or *pityriasis versicolor* (parasite *Microsporon furfur*), is a brown-coloured rash of scaly character occurring mostly in the form of spots or patches on the skin of the trunk, particularly on the front of the chest or between the shoulders, but sometimes also upon the arms and legs It affects adults in whom the skin-function is not sufficiently attended to, or those who are in ill-health The parasite affects the epidermic cells, and is readily made out by the microscope, thus enabling the disease to be distinguished from other skin disorders to which it often bears resemblance It is best treated by the regular washing and brisk friction of the parts, and by the use of some of the applications above referred to (J O A)

SKINNER, JOHN (1721–1807), author of *Tullochgorum* and *The Ewie wi' the Crookit Horn*, was an Episcopalian minister in the parish of Longside, Aberdeenshire He held this charge for more than sixty-four years The son of an Aberdeenshire schoolmaster, born at Balfour in 1721, he had been intended for the Presbyterian ministry, but, after passing through Marischal College, Aberdeen, and teaching for a few years, he took orders in the Episcopal Church, and was appointed to the charge of Longside in 1742 There was a considerable remnant of Episcopacy in Aberdeenshire, but very soon after Skinner joined it it became, in consequence of the Jacobite rebellion in 1745, a much persecuted remnant The young pastor's church was burnt, his house was plundered, for some years he had to minister to his congregation by stealth, and in 1753 information was lodged that he had broken the law by officiating to more than four persons besides his own family, and he suffered imprisonment for six months After 1760 the penal laws were less strictly enforced, but throughout the century the lot of the Episcopalian ministers in Scotland was far from comfortable, and only the humblest provisions for church services were tolerated Skinner's robust nature, however, made light of all privations, and his kindliness, humour, conviviality, ready wit, and generous force of character made him personally a favourite far and near outside the bounds of his own denomination In 1789 he was presented with the freedom of the town in whose jail he had been a prisoner for conscience sake It is by his songs, limited in quantity, but some of them of the very highest quality, that Skinner is generally known An interesting correspondence took place between him and Burns, who considered *Tullochgorum* "the best Scotch song Scotland ever saw," and addressed the reverend poet with touching respect His best songs had stolen into print, a collection was not published till 1809, under the title of *Amusements of Leisure Hours* Such literally they seem to have been Throughout his life he was a vigorous student, and in spite of his scanty resources established a more than local reputation for scholarship, while, according to his latest biographer, he had a paramount influence on the doctrinal views of his clerical brethren in the north He published in 1788 an *Ecclesiastical History of Scotland*, in the form of letters, and other works in the same form, which best suited his easy unaffected strength, were collected and published by his son after his death (June 1807), having previously had a wide circulation in manuscript His prose style has the happiness, ease, and lucid force of a natural master of language The reasoning of his answer to Beattie's *Essay on Truth* is an evidence of his robust clearness of intellect

A minutely accurate biography of Skinner, in connexion with the history of Episcopacy in the north of Scotland, was published by the Rev W Walker in 1883 An edition of his songs and poems by Mr H G Reid, 1859, contains an interesting memoir

SKIPTON, an ancient market-town in the West Riding of Yorkshire, is situated on the river Aire, on the Leeds and Liverpool Canal, and on the Midland Railway, 9 miles north-west of Keighley and 15 south-east of Settle It is substantially built of stone The strong castle built by Robert de Romille in the time of the Conqueror was partly demolished in 1649, but was restored by the countess of Pembroke Of the ancient building of De Romille all that now remains is the western doorway of the inner castle In the castle grounds are the ruins of the ancient parish church of St John The church of the Holy Trinity, in the Decorated Gothic, was also partly demolished during the Civil War, but was restored by the countess of Pembroke, and again underwent renovation in 1854 The free grammar school was founded in 1548 by William Ermysted, a canon of St Paul's, London The town has a considerable general trade The population of the urban sanitary district (area 4215 acres) in 1871 was 6078 and in 1881 it was 9091

Skipton was the capital of the ancient district of Craven At the Norman accession it became part of the possessions of Earl Edwin, and was granted to Robert de Romille, who built the castle about the end of the reign of William Subsequently it went to

the Albemarle family, but was again vested in the crown, and Edward II. bestowed it on Piers de Gaveston. In 1311 it came into the possession of the Cliffords. The castle was taken by the Parliamentary forces in 1645 and demolished in 1649.

SKITTLES. This English game, which somewhat resembles American bowls (see vol. iv. p. 180), was formerly known as *Kails* (Fr. *quilles*), and first came into vogue in England in the 14th century. Nine large oval-headed pins with flat bottoms, and made of a hard wood, are set up on a wooden frame, three pins square on each side. An angle and not an even side of the said square is presented towards the player, who stands at the distance of 21 feet. There may be one or two players a-side, and the object of each side is to knock down, or "floor," the greatest number of pins in the least possible number of throws, which are generally two or three, though they may extend to five, according to agreement. The roundish ball used for throwing weighs from 8 to 14 lb, and in fair playing only one step forward is allowed in delivery. A firm grasp should be taken of the ball in a slightly slanting position, so as to strike the fore pin on the shoulder and then reach the back ones. A player who clears the board in two throws may be considered a good all-round one. In different localities there are minor variations in playing the game.

SKUA,[1] the name for a long while given to certain of the *Laridæ* (see GULL, vol. xi. p. 274), which sufficiently differ in structure, appearance, and habits to justify their separation as a distinct genus, *Stercorarius* (*Lestris* of some writers), or even Subfamily, *Stercorariinæ*. Swift of flight, powerfully armed, but above all endowed with extraordinary courage, they pursue their weaker cousins, making the latter disgorge their already-swallowed prey, which is nimbly caught before it reaches the water, and this habit, often observed by sailors and fishermen, has made these predatory and parasitic birds locally known as "Teasers," "Boatswains,"[2] and, from a misconception of their intent, "Dunghunters." On land, however, whither they resort to breed, they seek food of their own taking, whether small mammals, little birds, insects, or berries, but even here their uncommon courage is exhibited, and they will defend their homes and offspring with the utmost spirit against any intruder, repeatedly shooting down on man or dog that invades their haunts, while every bird almost, from an Eagle downwards, is repelled by buffets or something worse.

The largest species known is the *Stercorarius catarrhactes* of ornithologists—the "Skooi" or "Bonxie" of the Shetlanders, a bird in size equalling a Herring Gull, *Larus argentatus*. The sexes do not differ appreciably in colour, which is of a dark brown, somewhat lighter beneath, but the primaries have at the base a patch of white, visible even when the wings are closed, and forming, when they are spread, a conspicuous band. The bill and feet are black. This is a species of comparatively limited range, breeding only in some two or three localities in the Shetlands, about half a dozen in the Færoes,[3] and hardly more in Iceland. Out of the breeding-season it shows itself in most parts of the North Atlantic, but never seems to stray further south than Gibraltar or Morocco, and it is therefore a matter of much interest to find the Southern Ocean inhabited by a bird—the "Port Egmont Hen" of Cook's *Voyages*—which so closely resembles the Skua as to have been for a long while regarded as specifically identical with it, but is now usually recognized as distinct under the name of *S. antarcticus*. This bird, characterized by its stout deep bill and want of rufous tint on its lower plumage, has an extensive range, and would seem to exhibit a tendency to further differentiation, since Mr Saunders, in a monograph of the group (*Proc. Zool. Society*, 1876, pp. 317–332), says that it presents three local forms—one occurring from New Zealand to Norfolk Island and past Kerguelen Land to the Cape of Good Hope, another restricted to the Falklands, and the third hitherto only met with near the south polar ice. On the western coast of South America, making its way into the Straits of Magellan, and passing along the coast so far as Rio Janeiro, is found *S. chilensis*, distinguished among other characters by the cinnamon tint of its lower plumage. Three other smaller species of the genus are known, and each is more widely distributed than those just mentioned, but the home of all is in the more northern parts of the earth, though in winter two of them go very far south, and, crossing the equator, shew themselves on the seas that wash the Cape of Good Hope, Australia, New Zealand, and Peru. The first of them is *S. pomatorhinus* (often incorrectly spelt *pomarinus*), about the size of a common Gull, *Larus canus*, and presenting, irrespective of sex, two very distinct phases of plumage, one almost wholly sooty-brown, the other particoloured—dark above and white on the breast, the sides of the neck being of a glossy straw-colour, and the lower part of the neck and the sides of the body barred with brown, but a singular feature in the adults of this species is that the two median tail feathers, which are elongated, have their shaft twisted towards the tip, so that in flight the lower surfaces of their webs are pressed together vertically, giving the bird the appearance of having a disk attached to its tail. The second and third species so closely resemble each other, except in size, that their distinctness was for many years unperceived, and in consequence their nomenclature is an almost bewildering puzzle. Mr Saunders (*loc. cit.*) thinks that the larger of them, which is about the size of a Black-headed Gull, should stand as *S. crepidatus*, and the smaller as *S. parasiticus*, though the latter name has been generally used for the larger when that is not termed, as it often is, *S. richardsonii*—a name that correctly applies only to whole coloured examples, for this species too is dimorphic. Even its proper English name[4] is disputable, but it has been frequently called the Arctic Gull or Arctic Skua, and it is by far the commonest of the genus in Britain, and perhaps throughout the northern hemisphere. It breeds abundantly on many of the Scottish islands, and in most countries lying to the northward. The nest is generally in long heather, and contains two eggs of a dark olive colour, suffused with still darker brown patches. Birds of either phase of plumage pair indiscriminately, and the young shew by their earliest feathers whether they will prove whole or particoloured, but in their immature plumage the upper surface is barred with pale reddish-brown. The smallest species, commonly known in English as the Long-tailed or Buffon's Skua, is not known to exhibit the remarkable dimorphism to which the two preceding are subject. It breeds abundantly in some seasons on the fells of Lapland, its appearance depending chiefly on the presence of lemmings (*Lemmus norvegicus*), on which it mainly preys. All these three species occasionally visit the southern coasts of Europe in large flocks, but their visitations are highly irregular. (A. N.)

SKUNK. The existence of the animal to which this name[5] is applied was first notified to European naturalists as long ago as 1636, in Gabriel Sagard-Theodat's *History of Canada*, where, in commencing his quaint account of it (p. 748), he describes it as "enfans du diable, que les Hurons appelle Scangaresse, . . . une beste fort puante," &c. This fully shows in what reputation the skunk was then held, a reputation which has lasted to the present time, and has become so notorious that the mere name of skunk is an opprobrious epithet and can hardly be used in polite society.

The skunks, for there are several species of these animals, are members of the Meline or badger-like section of the family *Mustelidæ*, which contains also the

---

[1] Thus written by Hoier (*circa* 1604) as that of a Færoese bird (*hodie* Skúr) an example of which he sent to Clusius (*Exotic. Auctarium*, p. 367). The word being thence copied by Willughby has been generally adopted by English authors, and applied by them to all the congeners of the species to which it was originally peculiar.

[2] This name in seamen's ornithology applies to several other kinds of birds, and, though perhaps first given to those of this group, is nowadays most commonly used for the species of TROPIC-BIRD (*q.v.*), the projecting middle feathers of the tail in each kind being generally likened to the marlinespike that is identified with the boatswain's position, but perhaps the authoritative character assumed by both bird and officer originally suggested the name.

[3] It has long been subjected to persecution in these islands, a reward being paid for its head. On the other hand, in the Shetlands a fine was exacted for its death, as it was believed to protect the sheep against Eagles. Yet for all this it would long ago have been extirpated there, and have ceased to be a British bird in all but name, but for the special protection afforded it by several members of two families (Edmonston and Scott of Melby), whose exertions to that effect deserve the praise and recognition of all ornithologists.

[4] It is the "Fasgadair" of the Hebrides, the "Shooi" of the Shetlands, and the "Scouti allen" of the fishermen on the east coast of Scotland.

[5] Probably derived from "Seccawk," the Cree name for the skunk. Another form given is "seganku."

martens, stoats, otters, &c., and forms the largest family of the *Arctoidea* or bear-like division of the Land *Carnivora* (see the article MAMMALIA, vol. xv. p. 439–40, where the zoological characters of these groups are given in detail).

The common skunk (*Mephitis mephitica*) is a native of North America, extending from Hudson's Bay southwards to Guatemala in Central America. It is a beautiful little animal, about the size of a cat, though of a stouter and heavier build, with rich lustrous black fur, strikingly

Common Skunk.

varied on the back by a very variably shaped patch or streak of white. Its muzzle is long and pointed, its eyes sharp and bead-like, and its grey or white tail is long and unusually bushy.

The following account of the habits and disposition of the skunk is extracted from Dr C. Hart Merriam's *Mammals of the Adirondack Region, New York*, 1884 :—

"The skunk preys upon mice, salamanders, frogs, and the eggs of birds that nest on or within reach from the ground. At times he eats carrion, and if he chances to stumble upon a hen's nest the eggs are liable to suffer; and once in a while he acquires the evil habit of robbing the hen-roost, but as a rule skunks are not addicted to this vice.

"Of all our native mammals perhaps no one is so universally abused and has so many unpleasant things said about it as the innocent subject of the present biography; and yet no other species is half so valuable to the farmer. Pre-eminently an insect-eater, he destroys more beetles, grasshoppers, and the like than all our other mammals together, and in addition to these he devours vast numbers of mice.

"He does not evince that dread of man that is so manifest in the vast majority of our mammals, and when met during any of his circumambulations rarely thinks of running away. He is slow in movement and deliberate in action and does not often hurry himself in whatever he does. His ordinary gait is a measured walk, but when pressed for time he breaks into a low shuffling gallop. It is hard to intimidate a skunk, but when once really frightened he manages to get over the ground at a very fair pace.

"Skunks remain active throughout the greater part of the year in this region, and hibernate only during the severest portion of the winter. They differ from most of our hibernating mammals in that the inactive period is apparently dependent solely on the temperature, while the mere amount of snow has no influence whatever upon their movements.

"Skunks, particularly when young, make very pretty pets, being attractive in appearance, gentle in disposition, interesting in manners, and cleanly in habits—rare qualities indeed! They are playful, sometimes mischievous, and manifest considerable affection for those who have the care of them. Their flesh is white, tender, and sweet, and is delicious eating.

"Skunks have large families, from six to ten young being commonly raised each season; and as a rule they all live in the same hole until the following spring."

We now come to the consideration of the remarkable and overpowering odour which has brought the skunk into such evil notoriety, and which is not the mere smell of the animal itself, as in the case of most other evil-smelling mammals, but arises from the much-modified secretion of the anal glands. These glands, although present in all *Mustelidæ*, are especially developed in the skunks, and are peculiar for being so entirely under the control of the animal that at ordinary times, as Dr Merriam has stated, the animal is enabled to be both cleanly and free from smell. The glands which secrete the odoriferous fluid are modifications of the ordinary anal glands possessed by nearly all *Carnivora*, but in the skunks they are enormously enlarged, entirely surround the rectum, and are provided with thick muscular gizzard-like coats. The two ducts leading from these glands open at the tips of two small conical papillæ placed just inside the anus, in such a position that by everting the anus the animal can protrude them externally, and with them can guide the direction of the jet of nauseous fluid, which is often propelled by the powerful muscles surrounding the glands to a distance of from 8 to 12 feet.

It is almost needless to state that the old stories about the skunk's smell arising from its urine, and of its splashing the fluid about with its tail are both entirely without foundation. The secretion itself is a clear yellowish liquid, with a marvellously penetrating ammoniacal and nauseous smell. So powerful and penetrating is this smell that Dr Merriam says, "I have known the scent to become strikingly apparent in every part of a well-closed house, in winter, within five minutes time after a skunk had been killed at a distance of more than a hundred yards," and under favourable conditions it may be distinctly perceived at a distance of more than a mile; instances are also on record of persons having become entirely unconscious after inhaling the smell. On the other hand it is said to act as a potent remedy in cases of asthma and similar diseases, but to most people such a remedy would be almost worse than the disease itself.

The other species of skunk are the following :—

The Long-tailed Skunk (*Mephitis macrura*), a native of central and southern Mexico, differs from the common species by generally having two white stripes along its sides, and by its much longer and bushier tail.

The little Striped Skunk (*Mephitis putorius*), found in the southern United States, and ranging southwards to Yucatan and Guatemala, is much smaller than *M. mephitica*, and its colouring is of a very peculiar and striking nature, consisting of four interrupted longitudinal white stripes on a black ground, the general aspect of the animal being one of the most beautiful and striking in all this brightly marked family. Its skull also differs to such an extent from that of the common skunk that this species has been separated as a distinct genus under the name of *Spilogale*, but there is hardly sufficient reason for this.

Finally, the Conepatl (*Conepatus mapurito*), the skunk of tropical America, ranging from Texas to Chili and Patagonia, differs still more from the true skunks, although in colour it is almost precisely similar to the common species, varying in the same way and to the same remarkable extent in the relative development of the black and white. Its build is heavier than in *Mephitis*; its snout and head are more pig-like; and its nostrils open downwards and forwards instead of laterally on the sides of the muzzle. Its skull has many special characters, and its teeth are different in shape and, as a rule, in number also, the first minute premolar of *Mephitis* being almost invariably absent, so that its dental formula is only $i\,\frac{3}{3}$, $c\,\frac{1}{1}$, $pm\,\frac{2}{3}$, $m\,\frac{1}{2}=32$.

For descriptions of the anal glands see Wyman, *Pr. Bost. Soc.*, i. p. 110, 1844; Warren, *Pr. Bost. Soc.*, iii. p. 175, 1851; Parker, *Ann. Nat.*, v. p. 246, 1871; Chatin, *Ann. Sci. Nat.*, [5], xix. p. 100, 1874; and for general descriptive accounts see Allen, *Bull. Harvard Coll.*, i. p. 178, 1869; Coues, *Fur-bearing Animals*, pp. 187–260, 1877; Merriam, *ut supra*. (O. T.)

SKVIRA, a district town of European Russia, in the government of Kieff, 77 miles south-west of Kieff, and 27 miles from the Fastova railway-junction. It is merely a big village, with 14,200 inhabitants, mostly engaged in agriculture, and has municipal institutions only as the seat of

the administration of the district There is a considerable export of grain and cattle from the district which is fertile and has many villages of from 3000 to 5000 inhabitants In the 14th century Skvira was a far more important town than now, but the wars destroyed it, so that two centuries later it was left uninhabited, it was settled anew by Prince Rózinski, and the population slowly reached the number of 1000 by the end of the last century The town has grown rapidly during the last ninety years

SKYE, the largest island of the Inner Hebrides, Scotland, is situated between the mainland of Inverness-shire, within which county it is included, and the group of the Outer Hebrides It lies between 57° 1′ 12″ and 57° 42′ 30″ N lat and 5° 38′ 50″ and 6° 47′ 8″ W long It is separated from the mainland at its eastern corner by Loch Alsh and Kyle Rhea, the channel at the narrowest point having a breadth of only about 3 furlongs Southwards Kyle Rhea widens out into the Sound of Sleat, and to the west of Loch Alsh there is a sudden widening of the gap to the extent of about 9 miles Along the eastern shore are the islands of Pabba, Scalpa, Raasay, Fladda, and Rona The Minch separating Lewis and the mainland bounds Skye on the north, and the Little Minch to the north-west separates it from North Uist and Harris The total area is 411,703 acres or 643 square miles The coast-line is extremely irregular, abounding in inlets of a great variety of form and size, and in the north and west it is wildly precipitous The island is naturally divided into three parts, each marked off by its distinctive geology and scenery By much the largest division lies to the north of a line drawn from Loch Brittle to the head of Loch Sligachan In this area the rocks are almost wholly varieties of basalt, disposed in nearly horizontal sheets, which give a singular tabular shape to the hills and terraced forms to the slopes To the east of Loch Snizort are the basaltic groups which include the Storr Rock (2360 feet), with its curious columns, and the Quiraing (1774 feet), with its verdant platform in the centre of a range of rugged cliffs In the north-west are Macleod's Tables (1601 feet) and some smaller summits The central division may be defined along its southern border by a line drawn from Loch Slapin to Broadford Its rocks are almost wholly of volcanic origin, and belong mainly to two groups, each characterized by its peculiar mountain outlines The dark gabbros and dolerites form the jagged ridges of the Cuillins, and reach in Scuir-na-Gillean a height of 3167 feet, and in Blaaven 3042 feet To the north-east of the Cuillins tower in striking contrast the pyramidal Red Mountains, consisting of granite, syenite, quartz porphyry, and various allied rocks, and reaching in Glamaig a height of 2670 feet The third division includes all the rest of the island, and consists of two tolerably distinct tracts The more northerly of these lies along the base of the Red Hills, and forms the narrow part of Skye between Strathaird and Broadford Bay It is composed mainly of Secondary rocks (Lias and Oolite), through which the eruptive masses of the Red Hills have been thrust The more southerly part comprises the district of Sleat, and consists of red sandstone (Torridon sandstone or Cambrian), rising in Scuir-na-Coinnich to 2401 feet, and of various crystalline schists and quartzites which stretch from Loch Alsh along the Sound of Sleat to the southern point of the island A considerable tract of limestone lies in the centre of Strath Parish, some of which has been altered by the eruptive rocks into a pure white marble There are several inland lochs of considerable size, the largest being Loch Coruisk, remarkable for the gloomy grandeur of its situation in the heart of the Cuillins

On account of the damp climate the land is better adapted for rearing sheep and cattle than for tillage A large number of cattle of the West Highland breed are grazed on the moors The sheep are principally blackfaced, but some Cheviots are also kept The greater portion of the inhabitants are crofters, who inhabit chiefly miserable huts with a fireplace in the middle of the floor, the smoke escaping by a hole in the roof The number of crofts in Skye, according to the report of the Crofters Commission 1884, was 2051 The number of families ejected by decrees from their holdings between 1840 and 1860 was 5012, representing a population of 25,060, and between 1860 and 1883 1948, representing a population of 9740 Many of the crofters support themselves partly by fishing In the Loch Carron and Skye district the number of boats in 1884 was 950, employing 2904 men and boys From 20,627 in 1821 the population of Skye had increased to 23,082 in 1841, but by 1871 it had decreased to 17,330 and in 1881 to 16,889, of whom 16,099 were Gaelic-speaking The number of females was 8903 and of males 7986 Portree, the principal town, has a population of 893

SLANDER See LIBEL

SLATE is an argillaceous rock of various colours—blue, green, purple, grey, and black—and a peculiar structure by which it readily splits into thin plates or laminæ It is of sedimentary origin, being primarily deposited on ocean floors as fine mud formed by the waste and denudation of pre-existing rocks, and afterwards compressed, hardened, and altered into compact rock Slate beds occur mainly in the Cambrian, Silurian, and Devonian formations—frequently alternating with bands of grit and limestone, or interstratified with felspathic lava or ashes—and, being tilted up from their original horizontal or nearly horizontal position, stretch across wide districts in a series of undulations, which rise to the surface in crests, or dip into troughs underground and form angles of every inclination with the horizon [1]

Slate rock splits along cleavage planes which are distinct from and independent of original stratification These planes are, as a rule, vertical or highly inclined, and intersect the lines of bedding at various angles, but sometimes coincide with them The strike of cleavage is generally parallel with that of the slate beds, and a uniform direction is often maintained over wide areas, as in North Wales, where it is nearly north-north-east and south-south-west, while in Shropshire it is north-east and south-west, and in Pembrokeshire north-by-west and south-by-east This peculiar cleavage structure is believed to be the result of a combination of intense forces, chiefly lateral pressure acting at right angles to the planes of cleavage

Contraction, compression, shearing, and other powerful forces have caused great disturbances in slate beds, since they were first thrown down as fine sediment, and the results are seen in the foldings, contortions, fissures, rents, and dislocations that now exist The fissures often follow well-defined courses and form divisional planes termed joints,—some running parallel with the strike and called strike joints, others running in the direction of the dip and called dip joints Dykes of greenstone and other

[1] The following table shows the older sedimentary formations in which slate beds mainly occur, in the order of superposition —

Primary or Palæozoic Rocks

Permian		Magnesian limestone, marls, sandstones, &c
Carboniferous		Coal measures, limestone, slate, &c
Devonian		Old red sandstone, slates, &c
Silurian	Upper	Ludlow group
		Wenlock
		Upper Llandovery
	Lower	Lower Llandovery
		Caradoc and Bala
		Llandeilo
		Arenig
		Tremadoc
		Lingula flags
		Menevian beds
Cambrian		Cambrian grits, conglomerates, and slates
Primitive crystalline rocks.		Gneiss, schists, &c

volcanic matter, and also veins of quartz, intersect the beds, and the surfaces of rents are frequently baked by heat ejected from the interior. Faults also occur, and cause displacements of the beds by upheaval or down-throw of one or other side of a rent.

Several varieties of clay slate are met with, and are characterized by the mineral that chiefly prevails. The colour—varying shades of blue, green, and purple being the most common—depends mainly on the presence of iron and the form in which it exists. The common roofing slate of commerce is generally fine-grained, and combines great strength and durability with moderate weight. It is also very dense, 1 cubic foot weighing over 170 lb, while according to Mr Wilkinson it takes on an average 20,000 lb to crush 1 cubic inch.

Certain varieties of slate, however, are soft and perishable, particularly the black carbonaceous kinds. Cubes of iron pyrites frequently occur in slate rock, and are generally deleterious owing to their tendency to decompose and fall out, but this is not always the case, as some of the most durable slates are sprinkled with pyrites without detriment.

The following percentage analysis of an average sample of Welsh roofing slate is given by Prof. Hull:[1]—

Silica	60·50	Magnesia	2·20
Alumina	19·70	Potash	3·18
Iron (protoxide)	7·83	Soda	2·20
Lime	1·12	Water	3·30

Slate has been used for roofing during many centuries, and it is said that some of the old castles of North Wales—such as Carnarvon and Conway—were covered with this material. And no doubt the better class of houses, situated in the neighbourhood of slate beds, would be roofed with slates obtained by rough surface digging, or from blocks exposed by mountain streams and split by the action of the weather, long before regular quarrying operations commenced. The Delabole quarries of Cornwall had acquired considerable importance as far back as the 16th century, and some of the Welsh slate quarries are very old, as are those of Angers in France. But the slate industry belongs mainly to the present century and latter part of the 18th; and since the opening up of the country by sea and land communications the progress and development of slate quarries have been great and rapid. The largest and most valuable quarries of North Wales are worked in the Cambrian and Lower Silurian beds, those of Llanberis and Penrhyn being worked in the former, and the Festiniog quarries in the latter. Important quarries are worked in Cumberland (Lower Silurian), Westmoreland, and Lancashire (Upper Silurian), and also in Devon and Cornwall (Devonian and Carboniferous), the lake districts being specially noted for their rich green slates. Some of the western and midland districts of Scotland—mainly Argyleshire, Dumbartonshire, and Perthshire—produce very strong and durable slates (Lower Silurian and Cambrian), the largest and most important quarries being at Ballachulish in Argyllshire, where 15,000 tons are annually made. The Scotch slates are chiefly blue in colour, but thin beds of green are found in some of the central districts.

Slate is now almost universally used for roofing houses and buildings of every description, and for such purposes it is unequalled, the better sorts possessing all the qualities necessary for protection against wind, rain, and storm. The finer varieties are made into writing slates, and in districts where cross cleavage exists slate pencils are made. Slabs are also manufactured, and, being readily cut, planed, dressed, and enamelled, are used for chimney-pieces, billiard tables, wall linings, cisterns, paving, tomb-stones, ridge rolls, and various other architectural and industrial purposes.

Slate rocks are quarried both above ground and below ground, according as they lie near to or distant from the surface. When they are near the surface, and their dip corresponds with the slope of the ground, they are in the most favourable position, and are worked in terraces or galleries formed along the strike of the beds and having a height of about 50 feet. The galleries are generally carried on in sections of 10 yards, worked across the beds, and may rise to any height or be sunk below the surrounding level by excavations. When the rock is much removed from the surface, or inconveniently situated for open workings, it is quarried in underground chambers reached by levels driven through the intervening mass and across or along the beds. Or it may be necessary to sink shafts as in coal pits before the rock is arrived at, but the cost of doing so forms a serious drawback. Inclines, waggons, tramways, and other machinery are employed in slate quarries as in other quarries, to suit the special circumstances and position of the operations, and need not be detailed.

The sections of a gallery are generally worked by crews of six men, who undertake to perform all operations of quarrying, splitting, and dressing at fixed rates. The rock is bored by jumper drills directed and turned by the hand and driven by hammers. When the bore is short and of small diameter one man can do the work, holding the jumper with one hand and using the hammer with the other. But when a large mass of rock has to be thrown down a bore 4 to 6 feet deep and a diameter of 2 to 3 inches is required and three men are employed,—one to guide and turn the jumper and two to drive it with heavy hammers. Bores of intermediate size are made by two men, one holding and the other driving the drill. When the boring has to be done on a steep face a staging is fixed to the rock or suspended from the top by means of ropes. The explosive generally used is rock-blasting powder, being the most suitable for the heaving force required to throw out or detach masses of rock without much splintering, which would destroy the blocks for slate making. Advantage is taken of the natural cuts or joints in blasting, as the rock is readily thrown or worked off these. From the mass thrown out by the blast, or loosened so as readily to come away by the use of crowbars, the men carefully select and sort all good blocks and send them in waggons to the slate huts to be split and dressed into slates. Two men are employed at this operation—one splitting and the other dressing, performing their work in a sitting posture. The splitter places a block on end between his knees, and with chisel and mallet splits it into as many plates as possible of the usual thickness for roofing purposes—namely, quarter of an inch more or less according to the size and strength required. These plates are then placed horizontally by the dresser on a vertical iron "stand," and cut with a sharp knife into slates of various sizes suitable for the market (from 30 in. × 16 in. to 10 in. × 6 in.). Certain sizes are designated by names from the peerage, such as princesses (24 in. × 14 ins.), duchesses (24 × 12), marchionesses (22 × 11), countesses (20 × 10), viscountesses (18 × 9), ladies (16 × 10), &c. In every slate rock there is a large amount of waste or bad rock, which is thrown away as rubbish—the proportion of good to bad varying from one in twelve to one in thirty. Attempts are being made at present to have this waste material manufactured into some article of industrial value; and, as it consists chiefly of silica and alumina, these attempts should prove successful.

The slate industry of the British Isles is now of very considerable importance, that of North Wales in particular being immense. According to the census of 1881 the number of slate quarriers in the United Kingdom amounted to 15,765, while over half a million tons of slates and slabs are produced annually, the value of which may be estimated at or over £1,250,000. The number of slates exported in 1884 exceeded 49 millions, the declared value being £251,824, of which over 35 millions went to Germany, valued at £163,321, over 5¾ millions to Australasia, valued at £37,474, and over 3 millions to Denmark, valued at £34,304.

Good slate beds are also worked in the south of Ireland, particularly in the counties of Wicklow, Tipperary, Cork, and Kerry (Lower Silurian, Devonian, and Carboniferous). On the continent of Europe slate rock is worked in Devonian and other formations—in France (Lower Silurian and Devonian), Belgium, Sweden, Norway, Germany, Austria, and Italy (Oolitic). In North America immense slate beds extend from Newfoundland westwards to the Great Lakes and southwestwards to Arkansas (U.S.), and slate quarries are successfully worked in Newfoundland, Canada, and in the States of Maine, Vermont, Massachusetts, New York, Pennsylvania, &c. Writing and roofing slates and slabs of every variety of size and colour are manufactured in these; but none of the quarries have hitherto reached the immense developments of the principal ones in North Wales, and yet, with characteristic enterprise, roofing slates have been within recent years imported to Great Britain from Newfoundland and the United States. SLAVERY

IT appears to be true that, in the words of Dunoyer, the economic régime of every society which has recently become sedentary is founded on the slavery of the industrial professions. In the hunter period the savage warrior does not enslave his vanquished enemy, but slays him; the women of a conquered tribe he may, however, carry off and appropriate as wives or as servants, for in this period domestic labour falls almost altogether on their sex. In the pastoral stage slaves will be captured only to be sold, with the exception of a few who may be required for the care of flocks or the small amount of cultivation which is then undertaken. It is in proportion as a sedentary life prevails, and agricultural exploitation is practised on a larger scale, whilst warlike habits continue to exist, that the labour of slaves is increasingly introduced to provide food for the master, and at the same time save him from irksome toil. Of this stage in the social movement slavery seems to have been, as we have said, a universal and inevitable accompaniment.

But wherever theocratic organizations established themselves slavery in the ordinary sense did not become a vital element in the social system. The members of the lowest class were not in a state of individual subjection; the entire caste to which they belonged was collectively subject. It is in the communities in which the military order obtained an ascendency over the sacerdotal, and which were directly organized for war, that slavery (as the word is commonly understood) had its really natural and appropriate place. And, as war performed an indispensable function in human history, our just horror for some aspects of slavery must not prevent us from recognizing that institution as a necessary step in social progress. It is not merely that in its first establishment slavery was an immense advance by substituting for the immolation of captives, often accompanied by cannibalism, their permanent occupation in labour for the benefit of the victor. This advantage, recalled by an old though erroneous[1] etymology, is generally acknowledged. But it is not so well understood that slavery discharged important offices in the later social evolution—first, by enabling military action to prevail with the degree of intensity and continuity requisite for the system of incorporation by conquest which was its final destination; and, secondly, by forcing the captives, who with their descendants came to form the majority of the population in the conquering community, to an industrial life, in spite of the antipathy to regular and sustained labour which is deeply rooted in human nature, especially in the earlier stages of the social movement, when insouciance is so common a trait, and irresponsibility is hailed as a welcome relief. With respect to the latter consideration, it is enough to say that nowhere has productive industry developed itself in the form of voluntary effort; in every country of which we have any knowledge it was imposed by the strong upon the weak, and was wrought into the habits of the people only by the stern discipline of constraint. From the former point of view the freeman, then essentially a warrior, and the slave were mutual auxiliaries, simultaneously exercising different and complementary functions—each necessary to the maintenance and furthering the activity of the other, and thus co-operating, without competition or conflict, towards a common public end. In modern slavery, on the other hand, where the occupations of both parties were industrial, the existence of a servile class, instead of rendering the citizens disposable for social service in a different field, only guaranteed for some of them the possibility of self-indulgent ease, whilst it imposed on others the necessity of indigent idleness.

It was in the Roman state that military action—in Greece often purposeless and, except in the resistance to Persia, on the whole fruitless—worked out the social mission which formed its true justification. Hence at Rome slavery also most properly found its place, so long as that mission was in progress of accomplishment. As soon as the march of conquest had reached its natural limit, slavery began to be modified; and when the empire was divided into the several states which had grown up under it, and the system of defence characteristic of the Middle Ages was substituted for the aggressive system of antiquity, slavery gradually disappeared, and was replaced by serfdom, which again, with the rise of modern industrial life, gave way to personal freedom.

We have so far dealt with the *political* results of ancient slavery, and have found it to have been in certain respects not only useful but indispensable. When we consider its moral effects, whilst endeavouring to the utmost to avoid exaggeration, we must yet pronounce its influence to have been profoundly detrimental. In its action on the slave it marred in a great measure the happy effects of habitual industry by preventing the development of the sense of human dignity which lies at the foundation of morals, whilst the culture of his ideas and sentiments was in most cases entirely neglected, and the spontaneous education arising from the normal family relations was too often altogether denied him. On the morality of the masters—whether personal, domestic, or social—the effects of the institution were disastrous. The habit of absolute rule, always dangerous to our nature, was peculiarly corrupting when it penetrated every department of daily life, and when no external interference checked individual caprice in its action on the feelings and fortunes of inferiors. It tended to destroy the power of self-command, and exposed the master to the baneful influences of flattery. As regards domestic morality, the system offered constant facilities for libertinism, and tended to subvert domestic peace by compromising the just dignity and ruining the happiness of the wife. The sons of the family were familiarized with vice, and the general tone of feeling of the younger generation was lowered by their intimate association with a despised and degraded class. On social morality, properly so called, the habits of cruelty, or at least of harshness, engendered by the relation, had a powerful reaction. Hume observes on "the little humanity commonly observed in persons accustomed from their infancy to exercise so great authority over their fellow-creatures and to trample upon human nature. . . . Nor," he adds, "can a more probable reason be assigned for the severe, I might say, barbarous manners of ancient times than the practice of domestic slavery, by which every man of rank was rendered a petty tyrant, and educated amidst the

[1] *Servus* is not cognate with *servare*, as has often been supposed; it is really related to the Homeric *εἴρερος* and the verb *εἴρω*, with which the Latin *sero* is to be connected. It may be here mentioned that *slave* was originally a national name; it meant a man of Slavonic race captured and made a bondman to the Germans. "From the Euxine to the Adriatic, in the state of captives or subjects, . . . they [the Slavonians] overspread the land, and the national appellation of the *Slaves* has been degraded by chance or malice from the signification of glory to that of servitude" (Gibbon, *Decline and Fall*, ch. lv.). The historian alludes to the derivation of the national name from *slava*, glory. See Skeat's *Etym. Dict.*, s.v.; see also SLAVS.

flattery, submission, and low debasement of his slaves." These deplorable results were, of course, not universally produced; there were admirable exceptions both amongst masters and amongst slaves—instances of benevolent protection on the one side and of unselfish devotion on the other, which did honour to human nature; but the evil effects without doubt greatly preponderated.

We proceed to a closer study of the institution of slavery as it existed in the Greek and Roman societies respectively.

GREECE. Heroic times.

We find it already fully established in the Homeric period. The prisoners taken in war are retained as slaves, or sold (*Il.*, xxiv. 752) or held at ransom (*Il.*, vi. 427) by the captor. Sometimes the men of a conquered town or district are slain and the women carried off (*Od.*, ix. 40). Not unfrequently free persons were kidnapped by pirates and sold in other regions, like Eumæus in the *Odyssey*. The slave might thus be by birth of equal rank with his master, who knew that the same fate might befall himself or some of the members of his family. The institution does not present itself in a very harsh form in Homer, especially if we consider (as Grote suggests) that "all classes were much on a level in taste, sentiment, and instruction." The male slaves were employed in the tillage of the land and the tending of cattle, and the females in domestic work and household manufactures. The principal slaves often enjoyed the confidence of their masters and had important duties entrusted to them; and, after lengthened and meritorious service, were put in possession of a house and property of their own (*Od.*, xiv. 64). Grote's idea that the women slaves were in a more pitiable condition than the males does not seem justified, except perhaps in the case of the *alitrides*, who turned the household mills which ground the flour consumed in the family, and who were sometimes overworked by unfeeling masters (*Od.*, xx. 110-119). Part of the agricultural work was sometimes done by poor hired freemen (*thetes*), who are spoken of as a wretched class (*Od.*, xi. 490), and were perhaps employed almost exclusively by the smaller landholders. Having no powerful protector to whom they could look up, and depending on casual jobs, they were probably in a less desirable position than the average slave. Homer conceives the lot of the latter as a bitter one (*Od.*, viii. 528; *Il.*, xix. 302), but it must be remembered that the element of change from a former elevated position usually enters into his descriptions. He marks in a celebrated couplet his sense of the moral deterioration commonly wrought by the condition of slavery (*Od.*, xvii. 322).

Historic period.

It is, however, in historic Greece, where we have ample documentary information, that it is most important to study the system of slavery,—and especially at Athens, where the principal work of Greek civilization found its accomplishment. The case of Sparta, in some respects peculiar, must be separately considered.

Sources of slavery.

The sources of slavery in Greece were:—1. Birth, the condition being hereditary. This was not an abundant source, women slaves being less numerous than men, and wise masters making the union of the sexes rather a reward of good service than a matter of speculation (Xen., *Œcon.*, ix. 5). It was in general cheaper to buy a slave than to rear one to the age of labour. 2. Sale of children by their free parents, which was tolerated, except in Attica, or their exposure, which was permitted, except at Thebes. The consequence of the latter was sometimes to subject them to a servitude worse than death, as is seen in the plays of Plautus and Terence, which, as is well known, depict Greek, not Roman, manners. Freemen, through indigence, sometimes sold themselves, and at Athens, up to the time of Solon, an insolvent debtor became the slave of his creditor. 3. Capture in war. Not only Asiatics and Thracians thus became slaves, but in the many wars between Grecian states, continental or colonial, Greeks were reduced to slavery by men of their own race. Thus Spartans were slaves at Tegea, and Gelon sold out of their country the commonalty of Hyblæan Megara. At Platæa, at Scione, in Melos, the men were massacred or deported, the women enslaved. Athenians were sold at Samos, and in Sicily after the failure of the expedition. In the struggle of parties at Corcyra, each faction, when triumphant, condemned the other to massacre or slavery. Callicratidas pronounced against the enslavement of Greeks by Greeks, but violated his own principle, to which, however, Epaminondas and Pelopidas appear to have been faithful. Philip sold his Olynthian captives, and, after Thebes was taken by Alexander, 30,000 women and children are said to have been sold. 4. Piracy and kidnapping. The descents of pirates on the coasts were a perpetual source of danger; the pirate was a gainer either by the sale or by the redemption of his captives. If ransomed, the victim became by Athenian law the slave of his redeemer till he paid in money or labour the price which had been given for him. Kidnappers (*andrapodistæ*) carried off children even in cities, and reared them as slaves. Whether from hostile forays or from piracy, any Greek was exposed to the risk of enslavement; it was a sword of Damocles suspended over all heads. 5. Commerce. Besides the sale of slaves which took place as a result of the capture of cities or other military operations, there was a systematic slave trade. Syria, Pontus, Lydia, Galatia, and above all Thrace were sources of supply. Egypt and Ethiopia also furnished a certain number, and Italy a few. Of foreigners, the Asiatics bore the greatest value, as most amenable to command, and most versed in the arts of luxurious refinement. But Greeks were highest of all in esteem, and they were much sought for foreign sale. Greece proper and Ionia supplied the petty Eastern princes with courtesans and female musicians and dancers. Athens was an important slave market, and the state profited by a tax on the sales; but the principal marts were those of Cyprus, Samos, Ephesus, and especially Chios.

Employments of slaves.

The slaves were employed either in domestic service—as house-hold managers, attendants, or personal escorts—or in work of other kinds, agricultural or urban. In early Attica, and even down to the time of Pericles, the landowners lived in the country. The Peloponnesian War introduced a change; and after that time the proprietors resided at Athens, and the cultivation was in the hands of slaves. In manufactures and commerce, also, servile gradually displaced free labour. Speculators either directly employed slaves as artisans or commercial and banking agents, or hired them out, sometimes for work in mines or factories, sometimes for service in private houses, as cooks, flute-players, &c., or for viler uses. There were also public slaves; of these some belonged to temples, to which they were presented as offerings, amongst them being the courtesans who acted as *hierodules* at Corinth and at Eryx in Sicily; others were appropriated to the service of the magistrates or to public works; there were at Athens 1200 Scythian archers for the police of the city; slaves served, too, in the fleets, and were employed in the armies,—commonly as workmen, and exceptionally as soldiers.

Number.

The number of slaves in Greece, or even at Athens, can scarcely be determined with any tolerable approach to certainty. It is stated by Athenæus (vi. 20), on the authority of Ctesicles, that the census of Demetrius Phalereus gave for Athens 21,000 citizens, 10,000 metics (resident foreigners), and 400,000 slaves. It is also stated by the same author that Corinth had possessed 460,000 slaves and Ægina 470,000. Hume, in his *Essay* "On the Populousness of Ancient Nations," maintained that the assertion of Athenæus respecting Athens is quite incredible,—that the number of Athenian slaves "is at least augmented by a whole cipher, and ought not to be regarded as more than 40,000." Boeckh and Letronne have since made the question the subject of fresh studies. The former has fixed the number of Attic slaves at about 365,000, the latter at 100,000 or 120,000. M. Wallon has revised the labours of these scholars, and adduced further considerations of his own.[1] He estimates the number of slaves employed in all Attica in domestic service at 40,000, in agriculture at 35,000, in the mines at 10,000, in manufactures and commerce at 90,000. To these must be added, for old people and children under twelve years of age, 6000 and 20,000 respectively, and also the public slaves, of whom, as we have said, 1200 were Scythian archers. He thus arrives at the conclusion that the servile population of Attica was comprised between the limits of 188,000 and 203,000 souls, the free population being about 67,000, and the metics amounting to 40,000. The slaves thus bore to the free native population the ratio of 3 to 1. The numbers given by Athenæus for Corinth and Ægina, though accepted by Boeckh, appear to be excessive, and are rejected by Clinton and by M. Wallon; the true numbers were no doubt large, but we have no means of determining them even approximately. Next after these cities in the magnitude of their slave population came, on the mainland, Megara, and, amongst the insular states, Chios and Rhodes. Miletus, Phocæa, Tarentum, Sybaris, and Cyrene also had numerous bodies of slaves.

Condition.

The condition of slaves at Athens was not in general a wretched one. Demosthenes (*In Mid.*, p. 530) says that, if the barbarians from whom the slaves were bought were informed of the mild treatment they received, they would entertain a great esteem for the Athenians. Plautus in more than one place thinks it necessary to explain to the spectators of his plays that slaves at Athens enjoyed such privileges, and even licence, as must be surprising to a Roman audience. The slave was introduced with certain customary rites into his position in the family; he was in practice, though not by law, permitted to accumulate a private fund of his own; his marriage was also recognized by custom; though in general excluded from sacred ceremonies and public sacrifices, slaves were admissible to religious associations of a private kind; there were some popular festivals in which they were allowed to participate; they had even special ones for themselves both at Athens and in other Greek centres. Their remains were deposited in the family tomb of their master, who sometimes erected monuments in testimony of his affection and regret. They often lived on terms of intimacy either with the head of the house or its younger members; but it is to be feared that too often this intimacy was founded, not

[1] Dr W. Richter (*Die Sklaverei im Griechischen Altertume*, 1886) maintains the correctness of the statement in Athenæus.

on mutual respect, as in the heroic example of Ulysses and Eumæus, but on insolent self-assertion on the one side and a spirit of unworthy compliance on the other, the latter having its *raison d'être* in degrading services rendered by the slave. Aristophanes and Plautus show us how often resort was had to the discipline of the lash even in the case of domestic slaves. Those employed in workshops, whose overseers were themselves most commonly of servile status, had probably a harder lot than domestics; and the agricultural labourers were not unfrequently chained, and treated much in the same way as beasts of burden. The displeasure of the master sometimes dismissed his domestics to the more oppressive labours of the mill or the mine. A refuge from cruel treatment was afforded by the temples and altars of the gods and by the sacred groves. Nor did Athenian law leave the slave without protection. He had, as Demosthenes boasts, an action for outrage like a freeman, and his death at the hand of a stranger was avenged like that of a citizen (Eurip., *Hec.*, 288), whilst, if caused by his master's violence, it had to be atoned for by exile and a religious expiation. Even when the slave had killed his master, the relatives of the house could not themselves inflict punishment; they were obliged to hand him over to the magistrate to be dealt with by legal process. The slave who had just grounds of complaint against his master could demand to be sold; when he alleged his right to liberty, the law granted him a defender and the sanctuaries offered him an asylum till judgment should be given. Securities were taken against the revolt of slaves by not associating those of the same nationality and language; they were sometimes fettered to prevent flight, and, after a first attempt at escape, branded to facilitate their recovery. There were treaties between states for the extradition of fugitives, and contracts of mutual assurance between individuals against their loss by flight. Their inclination to take advantage of opportunities for this purpose is shown by the number that escaped from Athens to join the Spartans when occupying Decelea. There were formidable revolts at the mines of Laurium, and more than once in Chios. The evidence of slaves—women as well as men—was often, with the consent of their masters, taken by torture, and that method is generally commended by the orators as a sure means of arriving at the truth, though sometimes, when it suits their immediate object, they take a different tone. The several forms of the "question" are enumerated in the *Frogs* of Aristophanes. If the slave was mutilated or seriously injured in the process, compensation was made, not to him, but to his master by the person who had demanded the use of torture.

Emancipation.

The slave could purchase his liberty with his peculium by agreement with his master. He could be liberated by will, or, during his master's life, by proclamation in the theatre, the law courts, or other public places, or by having his name inscribed in the public registers, or, in the later age of Greece, by sale or donation to certain temples—an act which did not make the slave a hierodule but a freeman. Conditions were sometimes attached to emancipation, as of remaining for life or a definite time with the former master, or another person named by him, or of performing some special service; payments or rights of succession to property might also be reserved. By manumission the Athenian slave became in relation to the state a metic, in relation to his master a client. He was thus in an intermediate condition between slavery and complete freedom. If the freedman violated his duties to his patron he was subject to an action at law, and if the decision were against him he was again reduced to slavery. He became a full member of the state only, as in the case of foreigners, by a vote in an assembly of six thousand citizens; and even this vote might be set aside by a *graphe paranomon*. Slaves who had rendered eminent services to the public, as those who fought at Arginusæ and at Chæronea, were at once admitted to the status of citizens in the class of (so-called) Platæans. But it would appear that even in their case some civic rights were reserved and accorded only to their children by a female citizen. The number of freedmen at Athens seems never to have been great.

Theoretic views on slavery.

It is well known that Aristotle held slavery to be necessary and natural, and, under just conditions, beneficial to both parties in the relation—views which were correct enough from the political side, regard being had to the contemporary social state. His practical motto, if he is the author of the *Economics* attributed to him, is—"no outrage, and no familiarity." There ought, he says, to be held out to the slave the hope of liberty as the reward of his service. Plato condemned the practice, which the theory of Aristotle also by implication sets aside as inadmissible, of Greeks having Greeks for slaves. In the *Laws* he accepts the institution as a necessary though embarrassing one, and recommends for the safety of the masters that natives of different countries should be mixed and that they should all be well treated. But, whilst condemning harshness towards them, he encourages the feeling of contempt for them as a class. Xenophon also, in urging a mild treatment of them, seems to have in view, not their own well-being, but the security of the masters. The later moral schools of Greece scarcely at all concern themselves with the institution. The Epicurean had no scruple about the servitude of those whose labours contributed to his own indulgence and tranquillity; he would at most cultivate an easy temper in his dealings with them. The Stoic regarded the condition of freedom or slavery as an external accident, indifferent in the eye of wisdom; to him it was irrational to see in liberty a ground of pride or in slavery a subject of complaint; from intolerable indignity suicide was an ever open means of escape. The poets—especially the authors of the New Comedy—strongly inculcate humanity, and insist on the fundamental equality of the slave. The celebrated "homo sum" is a translation from Alexis, and the spirit of it breathes in many passages of the Greek drama. A fragment of Philemon declares, as if in reply to Aristotle, that not nature, but fortune, makes the slave. Euripides as might be expected from his humanitarian cast of sentiment, and the "premature modernism" which has been remarked in him, rises above the ordinary feelings of his time in regard to the slaves. As Mr Paley says, he loves "to record their fidelity to their masters, their sympathy in the trials of life, their gratitude for kindness and considerate treatment, and their pride in bearing the character of honourable men. . . . He allows them to reason, to advise, to suggest; and he even makes them philosophize on the follies and the indiscretions of their superiors" (compare *Med.*, 54, *Orest.*, 869, *Hel.*, 728, *Ion*, 854, *Frag. Melan.*, 506, *Phrix.*, 823). But we are not to suppose that even he, latitudinarian and innovator as he was, could have conceived the possibility of abolishing an institution so deeply rooted in the social conditions, as well as in the ideas, of his time.

The Helots.

The case of the Helots of Laconia was different from that of the slaves in most Grecian communities. The origin of this class is disputed, and we cannot here enter into the controversy. They were regarded as the property of the state, which gave their services to individuals but kept in its own hands the power of emancipating them. The domestic servants of the Spartans were all Helots, and they waited on their masters at the *syssitia* or public meal. But they were in the main serfs, living in small country villages or in detached farms, cultivating the lands of the Spartan proprietors, and paying to those proprietors a proportion of the produce which could not be increased. They enjoyed their homes, wives, and families, could acquire property, were not to be sold out of the country, and perhaps could not be sold at all. They were, doubtless, employed in public works; in war they commonly acted as light armed troops attending on the Spartan or Periœcic hoplites, but in particular emergencies themselves served as hoplites (Thucyd., iv. 80). They were sometimes rewarded for good service by emancipation, which, however, did not make them Periœci, but introduced them into a special class known as *neodamodeis*. The condition of the Helot does not seem to have been economically onerous; but his consciousness of Grecian lineage, which Grote regards as an alleviation of his lot, must surely have been one of its bitterest elements, whilst it constantly kept alive the fear and consequent hatred of his Spartan masters, and made the relation between the two classes less natural than that of the ordinary Greek masters with slaves of foreign and less civilized races. By the ruling powers of Sparta the Helots were never trusted, and in one memorable case some two thousand of them, selected for special military merit, were massacred in secret (Thucyd., iv. 80). According to Plutarch, whose statement, however, has not always been credited, the ephors declared war against the Helots every year, and there was a practice, known as the *krypteia*, of detailing a number of young Spartan citizens for the purpose of assassinating such of them as were considered formidable. Wallon estimates the number of the Helots at 220,000, that of the Spartans being 32,000. The Penestæ in Thessaly and the Clarotæ in Crete seem to have occupied a position somewhat similar to that of the Helots in Laconia.

Rome.

We have already observed that the Roman system of life was that in which slavery had its most natural and relatively legitimate place; and accordingly it was at Rome that, as Blair has remarked, the institution was more than anywhere else "extended in its operation and methodized in its details." Not only on this ground is it especially deserving of our study, but because out of the slave-class, as it was organized by the Romans in the countries subject to the empire, the modern proletariate has been historically evolved.

Sources.

We must distinguish from the later slavery at Rome what Mommsen calls "the old, in some measure innocent" slavery, under which the farmer tilled the land along with his slave, or, if he possessed more land than he could manage, placed the slave—either as a steward, or as a sort of lessee obliged to render up a portion of the produce—over a detached farm. Though slaves were obtained by the early victories of Rome over her Italian neighbours, no large number was employed on the small holdings of those periods. But the extension of properties in the hands of the

patricians, and the continual absences of citizens required by the expanding system of conquest, necessarily brought with them a demand for slave labour, which was increasingly supplied by captives taken in war. Of the number furnished from this source a few particulars from the time of the mature republic and the first century of the empire will give some idea. In Epirus, after the victories of Æmilius Paullus, 150,000 captives were sold. The prisoners at Aquæ Sextiæ and Vercellæ were 90,000 Teutons and 60,000 Cimbri. Cæsar sold on a single occasion in Gaul 63,000 captives; Augustus made 44,000 prisoners in the country of the Salassi; after immense numbers had perished by famine and hardship and in the combats of the arena, 97,000 slaves were acquired by the Jewish war. But slavery, as Hume has shown, is unfavourable to population, and even the wars of Rome were insufficient to maintain the supply. Hence a regular commerce in slaves was established, which was based on the "systematically prosecuted hunting of man," and indicated an entire perversion of the primitive institution, which was essentially connected with conquest. The pirates sold great numbers of slaves at Delos, where was the chief market for this kind of wares; and these sales went on as really, though more obscurely, after the successful expedition of Pompey. There was a regular importation at Rome of slaves, brought to some extent from Africa, Spain, and Gaul, but chiefly from Asiatic countries—Bithynia, Galatia, Cappadocia, and Syria. A portorium—apparently one eighth for eunuchs, one fortieth for others—was paid on their import or export, and a duty of 2 or 4 per cent. on their sale.

There were other sources from which slavery was alimented, though of course in a much less degree. Certain offences reduced the guilty persons to slavery (*servi pœnæ*), and they were employed in public work in the quarries or the mines. Originally, a father could sell his children. A creditor could hold his insolvent debtor as a slave, or sell him out of the city (*trans Tiberim*). The enslavement of creditors, overwhelmed with usury in consequence of losses by hostile raids or their own absence on military service, led to the revolt of the Mons Sacer (493 B.C.). The Pœtelian law (326 B.C.) restricted the creditor's lien (by virtue of a *nexum*) to the goods of his debtor, and enacted that for the future no debtor should be put in chains; but we hear of debtors *addicti* to their creditors by the tribunals long after—even in the time of the Punic Wars.

Employments. There were *servi publici* as well as *privati*. The service of the magistrates was at first in the hands of freemen; but the lower offices, as of couriers, servants of the law courts, of prisons, and of temples, were afterwards filled by slaves. The execution of public works also came to be largely committed to them,—as the construction of roads, the cleansing of the sewers, and the maintenance of the aqueducts. Both kinds of functions were discharged by slaves, not only at Rome, but in the rural and provincial municipalities. The slaves of a private Roman were divided between the *familia rustica* and the *familia urbana*. At the head of the *familia rustica* was the *villicus*, himself a slave, with the wife who was given him at once to aid him and to bind him to his duties. Under him were the several groups employed in the different branches of the exploitation and the care of the cattle and flocks, as well as those who kept or prepared the food, clothing, and tools of the whole staff and those who attended on the master in the various species of rural sports. A slave prison (*ergastulum*) was part of such an establishment, and there were slaves whose office it was to punish the offences of their fellows. To the *familia urbana* belonged those who discharged the duties of domestic attendance, the service of the toilet, of the bath, of the table, of the kitchen, besides the entertainment of the master and his guests by dancing, singing, and other arts. There were, besides, the slaves who accompanied the master and mistress out of doors, and who were chosen for their beauty and grace as guards of honour, for their strength as chairmen or porters, or for their readiness and address in remembering names, delivering messages of courtesy, and the like. There were also attached to a great household physicians, artists, secretaries, librarians, copyists, preparers of parchment, as well as pedagogues and preceptors of different kinds,—readers, grammarians, men of letters and even philosophers,—all of servile condition, besides accountants, managers, and agents for the transaction of business. Actors, comic and tragic, pantomimi, and the performers of the circus were commonly slaves, as were also the gladiators. These last were chosen from the most warlike races—as the Samnites, Gauls, and Thracians. *Familiæ* of gladiators were kept by private speculators, who hired them out; they were sometimes owned by men of high rank.

Numbers. As to the numbers of slaves belonging to individual masters, though we have no distinct general statement in the Roman writers, several special examples and other indirect indications serve to show that the wealthier men possessed very large *familiæ*. This may be inferred from the *columbaria* of the house of Livia and of other great houses. Vettius armed four hundred of his own slaves when he entered on the revolt which was a prelude to the Second Servile War. The slaves of Pedanius Secundus, who, in spite of a threatened outbreak of the indignant populace, were all put to death because they had been under their master's roof when he was murdered, were four hundred in number. Pliny tells us that Cæcilius, a freedman of the time of Augustus, left by his will as many as 4116. The question as to the total number of slaves at Rome or in Italy is a very difficult one, and it is not, perhaps, possible to arrive with any degree of certainty at an approximate estimate. Gibbon supposes that there were in the Roman world in the reign of Claudius at least as many slaves as free inhabitants. But Blair seems right in believing that this number, though probably correct for an earlier period, is much under the truth for the age to which it is assigned. He fixes the proportion of slaves to free men as that of three to one for the time between the conquest of Greece (146 B.C.) and the reign of Alexander Severus (222–235 A.D.). The entire number of slaves in Italy would thus have been, in the reign of Claudius, 20,832,000, that of the free population being 6,944,000.

Laws. By the original Roman law the master was clothed with absolute dominion over the slave, extending to the power of life and death, which is not surprising when we consider the nature of the *patria potestas*. The slave could not possess property of any kind; whatever he acquired was legally his master's. He was, however, in practice permitted to enjoy and accumulate chance earnings or savings, or a share of what he produced, under the name of *peculium*. A master could not enter into a contract with his slave, nor could he accuse him of theft before the law; for, if the slave took anything, this was not a subtraction, but only a displacement, of property. The union of a male and female slave had not the legal character of a marriage; it was a cohabitation (*contubernium*) merely which was tolerated, and might be terminated at will, by the master; a slave was, therefore, not capable of the crime of adultery. Yet general sentiment seems to have given a stronger sanction to this sort of connexion; the names of husband and wife are freely used in relation to slaves on the stage, and even in the laws, and in the language of the tombs. For entering the military service or taking on him any state office a slave was punished with death. He could not in general be examined as a witness, except by torture. A master, when accused, could offer his slaves for the "question," or demand for the same purpose the slaves of another; and, if in the latter case they were injured or killed in the process, their owner was indemnified. A slave could not accuse his master, except of adultery or incest (under the latter name being included the violation of sacred things or places); the case of high treason was afterwards added to these. An accused slave could not invoke the aid of the tribunes. The penalties of the law for crime were more severe on guilty slaves than on freemen; "majores nostri," say the legists, "in omni supplicio severius servos quam liberos puniverunt." The capital punishment of the freeman was by the sword or the precipice,—of the slave by the axe or the cross. The lex Cornelia punished the murder of a slave or a freeman alike; but the master who killed his own slave was not affected by this law.

Treatment of slaves. Columella, like Xenophon, favours a certain friendliness and familiarity in one's intercourse with his farm slaves. Cato ate and drank the same coarse victuals as his slaves, and even had their children suckled by his wife, that they might imbibe a fondness for the family. But that rigid old economist had a strict eye to profit in all his dealings with them. He allowed the contubernium of male and female slaves at the price of a money payment from their peculium. Columella regarded the gains from the births as a sufficient motive for encouraging these unions, and thought that mothers should be rewarded for their fecundity; Varro, too, seems to have taken this view. The immense extension of the rural estates (*latifundia*) made it impossible for masters to know their slaves, even if they were disposed to take trouble for the purpose. Effective superintendence even by overseers became less easy; the use of chains was introduced, and these were worn not only in the field during working hours but at night in the ergastulum where the labourers slept—a practice which Pliny lamented as a disgrace to agriculture. Urban slaves had probably often a life as little enviable, especially those who worked at trades for speculators. Even in private houses at Rome, so late as the time of Ovid, the porter was chained. In the *familia urbana* the favourites of the master had good treatment, and might exercise some influence over him which would lead to their receiving flattery and gifts from those who sought his vote or solicited his support. Doubtless there was often genuine mutual affection, slaves sometimes, as in noted instances during the civil wars, showed the noblest spirit of devotion to their masters. Those who were not inmates of the household, but were employed outside of it as keepers of a shop or boat, chiefs of workshops, or clerks in a mercantile business, had the advantage of greater freedom of action. The slaves of the *leno* and the *lanista* were probably in most cases not only degraded but unhappy. The lighter punishments inflicted by masters were commonly personal chastisement or banishment from the town house to rural labour; the severer were employment in the mill (*pistrinum*) or relegation to the mines or

quarries To the mines speculators also sent slaves, they worked half-naked, men and women, in chains, under the lash and guarded by soldiers Vedius Pollio, in the time of Augustus, was said to have thrown his slaves, condemned sometimes for trivial mistakes or even accidents, to the lampreys in his fishpond Cato advised the agriculturist to sell his old oxen and his old slaves, as well as his sick ones, and sick slaves were exposed in the island of Æsculapius in the Tiber, by a decree of Claudius slaves so exposed, if they recovered, could not be reclaimed by their masters

Though the Roman slaves were not, like the Spartan Helots, kept obedient by systematic terrorism, their large numbers were a constant source of solicitude in the later period of the republic and under the early empire The law under which the slaves of Pedanius were put to death, probably first made under Augustus and more fully enacted under Nero, is sufficient proof of this anxiety, which indeed is strongly stated by Tacitus in his narrative of the facts There had been many conspiracies amongst the slaves in the course of Roman history, and some formidable insurrections We hear of a conspiracy about 500 B C and another in 419 B C, again just before the sea fight of Duilius and between the battles of Trasimenus and Cannæ In 198 B C a servile war had almost broken out, in 196 B C there was a rising in Etruria and in 185 B C in Apulia The growth of the latifundia made the slaves more and more numerous and formidable Free labour was discountenanced Cato, Varro, and Columella all agree that slave labour was to be preferred to free except in unhealthy regions and for large occasional operations, which probably transcended the capacity of the permanent *familia rustica* Cicero and Livy bear testimony to the disappearance of a free plebs from the country districts and its replacement by gangs of slaves working on great estates The policy of the Gracchi and their successors of the popular party was opposed to this reduction of the free working population, which they sought to counteract by agrarian laws and by colonization on a large scale—projects which could not be effectively carried out until civil supremacy was united with military power in the hands of a popular chief, and which, even when this condition was satisfied by the establishment of the empire, were inadequate to meet the evil The worst form of prædial slavery existed in Sicily, whither Mommsen supposes that its peculiarly harsh features had been brought by the Carthaginians In Sicily, accordingly, the first really serious servile insurrections took place, at once provoked by the misery of the slaves and facilitated by the habits of brigandage which, it is said, the proprietors had tolerated and even encouraged as lightening the cost of subsistence of their slaves The rising under Ennus in 133 B C was with some difficulty suppressed by Rupilius Partial revolts in Italy succeeded, and then came the second Sicilian insurrection under Trypho and Athenio, which, after a severe struggle, was put down by Aquilius These were followed by the Servile War in Italy under Spartacus, which, occurring at an otherwise critical period, severely tested the military resources of Rome In the subsequent civil conflicts the aid of slaves was sought by both parties, even by Marius himself, and afterwards by Catiline, though he finally rejected their services Clodius and Milo employed bands of gladiators in their city riots, and this action on the part of the latter was approved by Cicero In the First Civil War they were to be found in both camps, and the murderers of Cæsar were escorted to the Capitol by gladiators Antony, Octavius, and Sextus Pompeius employed them in the Second Civil War, and it is recorded by Augustus on the Monumentum Ancyranum that he gave back to their masters for punishment about 30,000 slaves who had absconded and borne arms against the state Under Tiberius, at the death of Caligula, and in the reign of Nero there were threatening movements of the slaves In the wars from Otho to Vespasian they were employed, as Tacitus tells us, even by the most scrupulous generals

Of the moral influences of slavery we have already spoken In the particular case of Rome it cannot be doubted that it largely contributed to the impurities which disgraced private life, as seen in the pages of Juvenal, Martial, and Petronius It is shocking to observe the tone in which Horace, so characterized by geniality and bonhomie, speaks of the subjection of slaves to the brutal passions of their masters (*Sat*, i 2, 116) The hardening effect of the system appears perhaps most strikingly in the barbarous spectacles of the amphitheatre, in which even women took pleasure and joined in condemning the gladiator who did not by his desperate courage satisfy the demands of a sanguinary mob It led, further, to a contempt for industry, even agriculture being no longer held in esteem ("quum sit publice accepta et confirmata jam vulgaris existimatio, rem rusticam sordidum opus," Col., i, præf 20) The existence of slavery, degrading free labour while competing with freemen for urban employment, multiplied the idle and worthless population of Rome, who sought only "panem et circenses" These had to be supported by public distributions, which the emperors found they could not discontinue, and by the bounty of patrons, and, like the "mean whites" of modern America, formed a dangerous class, purchasable by selfish ambitions and ready to aid in civil disturbances

Emancipation

Blair, in comparing the Greek and Roman systems of slavery, points with justice to the greater facility and frequency of emancipation as the great superiority of the latter No Roman slave, he says, "needed to despair of becoming both a freeman and a citizen" Manumission was of two kinds—*justa* or regular, and *minus justa* Of *manumissio justa* there were four modes —(1) by adoption, rarely resorted to, (2) by testament, already recognized in the Twelve Tables, (3) by *censu*s, which was of exceptional use, and did not exist later than the time of Vespasian, and (4) by *vindicta*, which was the usual form In the last method the master turned the slave round, with the words "liber esto," in the presence of the prætor, that officer or his lictor at the same time striking the slave with his rod The *manumissio minus justa* was effected by a sufficient manifestation of the will of the master, as by letter, by words, by putting the *pileus* (or cap of liberty) on the slave, or by any other formality which had by usage become significant of the intention to liberate, or by such an act as making the slave the guardian of his children This extra-legal sort of manumission was incomplete and precarious, even after the lex Julia Norbana (19 A D), which assimilated the position of those so liberated to that of the Latin colonists, under the name of Latini juniores, the person remained in the eye of the law a slave till his death and could not dispose of his peculium

A freedman, unless he became such by operation of law, remained client of his master, and both were bound by the mutual obligations arising out of that relation These obligations existed also in the case of freedmen of the state, of cities, temples, and corporations The freedman took his former master's name, he owed him deference (*obsequium*) and aid (*officium*), and neglect of these obligations was punished, in extreme cases even with loss of liberty Conditions might be annexed by the master to the gift of freedom, as of continued residence with him, or of general service or some particular duty to be performed, or of a money payment to be made But the prætor Rutilius, about the beginning of the 1st century B C, limited the excessive imposition of such conditions, and his restrictions were carried further by the later jurists and the imperial constitutions Failing natural heirs of an intestate freedman, the master, now patron, succeeded to his property at his death, and he could dispose by will of only half his possessions, the patron receiving the other half Freedmen and their sons were subject to civil disabilities, the third generation became *ingenui* (full citizens) Thus, by a process of constant infiltration, the slave element tended to merge itself in the general popular body, and Scipio Æmilianus could reply to the murmurs of a plebeian crowd, "Taceant quibus Italia noverca est, non efficietis ut solutos verear quos alligatos adduxi" (Val Max, vi 2, 3)

It was often a pecuniary advantage to the master to liberate his slave, he obtained a payment which enabled him to buy a substitute, and at the same time gained a client This of course presupposes the recognition of the right of the slave to his peculium, and the same is implied in Cicero's statement that a diligent slave could in six years purchase his freedom Augustus set himself against the undue multiplication of manumissions, probably considering the rapid succession of new citizens a source of social instability, and recommended a similar policy to his successor The lex Ælia Sentia (about 3 A D) forbade manumission, except in strictly limited cases, by masters under 20 years of age or of slaves under 30, and the lex Furia Caninia (about 7 A D) fixed the proportion of a man's slaves which he could liberate by testament, and forbade more than a hundred being so enfranchised whatever might be the number of the familia Under the empire the freedmen rose steadily in influence, they became admissible to the rank of equites and to the senate, they obtained provincial governments, and were appointed to offices in the imperial household which virtually placed them at the head of administrative departments Pallas and Narcissus are familiar types of the unworthy members of this class, and there were doubtless many outside of official life who exhibited the ostentation and insolence of the parvenu, but there were others who were highly deserving of esteem Freedmen of humbler rank filled the minor offices in the administrative service, in the city cohorts, and in the army, and we shall find that they entered largely into the trades and professions when free labour began to revive They appeared also in literature, we hear of several historical and biographical memoirs by freedmen under the republic and the early empire, many of them were professors of grammar and the kindred arts, as Tiro, the amanuensis of Cicero, and Hyginus, the librarian of Augustus, and names of a higher order are those of Livius Andronicus, Cæcilius, Statius, Terence, Publius Syrus, Phædrus, and Epictetus

Reforms.

In the 2d century of the Christian era we find a marked change with respect to the institution of slavery, both in the region of thought and in that of law Already the principles of reason and humanity had been applied to the subject by Seneca who, what-

ever we may think of him as a man, deserves our gratitude for the just and liberal sentiments he expressed respecting the slaves, who, he says, should be treated as "humble friends," and especially for his energetic reprobation of gladiatorial combats and of the brutality of the public who enjoyed those sanguinary shows. But it was in the 2d century, as we have said, that "the victory of moral ideas" in this, as in other departments of life became 'decisive. Dio Chrysostom, the adviser of Trajan, is the first Greek writer who has pronounced the principle of slavery to be contrary to the law of nature" (Mark Pattison). And a parallel change is found in the practical policy of the state. The military vocation of Rome was now felt to have reached its normal limits, and the emperors, understanding that, in the future, industrial activity must prevail, prepared the abolition of slavery as far as was then possible, by honouring the freedmen, by protecting the slave against his master, and by facilitating manumissions. The jurists who, in the absence of a recognized spiritual power, provisionally discharged in their own way the office of systematizing practical morals, modified, by means of the useful fiction of the *jus naturale*, the presumptions of law and the interpretation of doubtful instruments ("Quod ad jus naturale attinet, omnes homines æquales sunt"—Ulpian. "Servitus est constitutio juris gentium, qua quis dominio alieno contra naturam subjicitur"—Florentinus.) The general tendency both of the imperial constitutions and of the maxims of the legists is in favour of liberty ("Nec ignotum est quod multa contra juris rigorem pro libertate sint constituta"—Ulpian.) The practices of exposure and sale of children, and of giving them in pledge for debt, are forbidden. An edict of Diocletian forbade a free man to sell himself. Manstealers or kidnappers (*plagiarii*) were punished with death. The insolvent debtor was withdrawn from the yoke of his creditor. While the slave trade was permitted, the atrocious mutilation of boys and young men, too often practised, was punished with exile and even with death. In redhibitory actions (for the annulment of sales), if a slave were returned to the seller, so must also be his parents, brothers, and *personæ contubernio conjunctæ*. In the interpretation of testaments it was to be assumed that members of the same family were not to be separated by the division of the succession. The law also favoured in special cases the security of the peculium, though in general principle it still remained the property of the master. The state granted to public slaves the right of bequeathing half their possessions, and private persons sometimes permitted similar dispositions even to a greater extent, though only within the familia. Hadrian took from masters the power of life and death and abolished the subterranean prisons. Antoninus Pius punished him who killed his own slave as if he had killed another's. Already in the time of Nero the magistrates had been ordered to receive the slave's complaint of ill-treatment, and the lex Petronia, belonging to the same or an earlier period, forbade masters to hand over their slaves to combats with wild beasts. Antoninus directed that slaves treated with excessive cruelty, who had taken refuge at an altar or imperial image, should be sold, and this provision was extended to cases in which the master had employed a slave in a way degrading to him or beneath his character. M. Aurelius gave to masters an action against their slaves for any cause of complaint, thus bringing their relation more directly under the surveillance of law and public opinion. A slave's oath could still not be taken in a court of law, he was interrogated by the "question", but the emperors and jurists limited in various ways the application of torture, adding, however, as we have mentioned, to the cases in which it could previously be appealed to that of the crime of *majestas*. For certain alleged offences of the master the slave could bring an action, being represented for the purpose by an *adsertor*. Emancipation was facilitated, some of the old formalities were dispensed with, obstacles to it were removed, and legal difficulties solved in such a way as to further it. The power of imposing conditions on testamentary manumissions was restricted, and these conditions interpreted in the sense most favourable to freedom. The emperor could confer liberty by presenting a gold ring to a slave with the consent of the master, and the legal process called *restitutio natalium* made him a full citizen. It was decided that liberty could not be forfeited even by a prescription of sixty years' duration.

Influence of Christianity. The rise of Christianity in the Roman world still further improved the condition of the slave. The sentiments it created were not only favourable to the humane treatment of the class in the present, but were the germs out of which its entire liberation was destined, at a later period, in part to arise. It is sometimes unreasonably objected to the Christian church that it did not denounce slavery as a social crime and insist on its immediate abolition, that on the contrary it recognized the institution, ecclesiastical persons and societies themselves being owners of slaves. We have seen that slavery was a fundamental element of the old Roman constitution, not only incorporated with the laws, but necessarily arising out of, and essential to, the military mission of the state. When the work of conquest had been sufficiently achieved, it could not be expected that a radical alteration should be suddenly wrought either in the social system which was in harmony with it, or even in the general ideas which had grown up under its influence. The latter would, indeed, be gradually affected, and accordingly we have observed a change in the policy of the law, indicating a change in sentiment with respect to the slave class, which does not appear to have been at all due to Christian teaching, but to have arisen from the spontaneous influence of circumstances co-operating with the softened manners which were inspired by a pacific régime. But the institution itself could not be at once seriously disturbed; it was too deeply rooted and too closely bound up with the whole existing order of things. If it could have been immediately abolished, the results must have been disastrous, most of all to the slave population itself. Before that end could be accomplished, an essentially new social situation must come into existence; society must be organized for defence as it had previously been for conquest, and this transformation could not be wrought in a day. But in the meantime much might be done towards further mitigating the evils of slavery, especially by impressing on master and slave their relative duties and controlling their behaviour towards one another by the exercise of an independent moral authority. This was the work open to the Christian priesthood, and it cannot be denied that it was well discharged. Whilst the fathers agree with the Stoics of the 2d century in representing slavery as an indifferent circumstance in the eye of religion and morality, the contempt for the class which the Stoics too often exhibited is in them replaced by a genuine sympathy. They protested against the multiplication of slaves from motives of vanity in the houses of the great, against the gladiatorial combats (ultimately abolished by the noble self-devotion of a monk), and against the consignment of slaves to the theatrical profession, which was often a school of corruption. The church also encouraged the emancipation of individual slaves and the redemption of captives. And its influence is to be seen in the legislation of the Christian emperors, which softened some of the harshest features that still marked the institution. There is not, indeed, a uniform advance in this legislation; there is even retrogression in some particulars under Constantine, as in his renewed permission to fathers to sell their children and to the finder of an exposed child to make it his slave—enactments which it is sometimes sought to excuse by the prevailing poverty of his period. But a stronger influence of Christianity appears in Theodosius, and this influence is at the highest in the legislation of Justinian. Its systematic effort is, in his own words, "pro libertate, quam et fovere et tueri Romanis legibus et præcipue nostro numini peculiare est." Law still refused in general to recognize the marriages of slaves, but Justinian gave them a legal value after emancipation in establishing rights of succession. Unions between slaves and free women, or between a freeman and the female slave of another, continued to be forbidden, and were long punished in certain circumstances with atrocious severity. As witness, the slave was still subject to the question; as criminal, he was punished with greater rigour than the freeman. If he accused his master of a crime, unless the charge was of treason, he was burnt. But he could maintain a legal claim to his own liberty, not now merely through an *adsertor*, but in person. A female slave was still held incapable of the offence of adultery; but Justinian visited with death alike the rape of a slave or freedwoman and that of a free maiden. Already the master who killed his slave had been punished as for homicide, except in the case of his unintended death under correction; Constantine treated as homicide a number of specially enumerated acts of cruelty. Even under Theodosius the combats of the amphitheatre were permitted, if not encouraged, by the state authorities; these sports were still expected from the candidates for public honours. Combats of men with beasts were longest continued; they had not ceased even in the early years of the reign of Justinian. A new process of manumission was now established, to be performed in the churches through the intervention of the ministers of religion; and it was provided that clerics could at any time by mere expression of will liberate their slaves. Slaves who were admitted to holy orders, or who entered a monastery, became freemen, under certain restrictions framed to prevent fraud or injustice. Justinian abolished the personal conditions which the legislation of Augustus had required to be satisfied by the master who emancipated and the slave who was manumitted, and removed the limitation of number. The liberated slave, whatever the process by which he had obtained his freedom, became at once a full citizen, his former master, however, retaining the right of patronage, the abolition of which would probably have discouraged emancipation.

Transition to serfdom. The slavery of the working classes, justly described by Hume as the most important difference between the social life of antiquity and that of modern times, was not directly changed into the system of personal freedom. There was an intermediate stage which has not always been sufficiently discriminated from slavery, though the

confusion of the two leads to endless misconceptions. We mean the régime of serfdom. In studying the origin of this transitional state of things, four principal considerations have to be kept in view. (1) As Gibbon observes, the substantial completion of the Roman system of conquest and incorporation reduced the supply of slaves by restricting the dealings in them to such trade as took place within the now fixed limits of the empire. It is true that, when the barbarian invasions began in the 3d century, many captives were made, who, when not enrolled in the army, were employed in agriculture or domestic service; but the regular importation was greatly and increasingly diminished, and the Romans were obliged to have recourse to "the milder but more tedious method of propagation." The effect of this was to improve the condition of the slave by rendering his existence an object of greater value to his master. It tended, indeed, directly to the transformation of slavery into serfdom by making it the interest of each family to preserve indefinitely its own hereditary slaves, who could not be replaced except with difficulty and at great expense. The abolition of the external slave trade tended, in fact, to put an end to internal sales, and the slaves became attached to the households or lands of their masters. (2) The diminished supply of slaves further acted in the direction of the rehabilitation of free labour. A general movement of this kind is noticeable from the 2d century onwards. Freemen had always been to some extent employed in the public service—(*a*) as subordinate assistants to the magistrates and priests; the places of scribes, viatores, criers could be filled only by citizens; the apparitors attached to the new imperial administration were also free plebeians, with slaves in the lower ranks; but these apparitorships were usually held by freedmen. So also (*b*) public works were in the 2d century divided amongst corporations of free plebeians, with public slaves under them. In private service the superior posts were often filled by freedmen; the higher arts—as medicine, grammar, painting—were partly in the hands of freedmen and even of *ingenui*; the more successful actors and gladiators were often freedmen. In the factories or workshops kept by wealthy persons slave labour was mainly employed; but free artisans sometimes offered their services to these establishments or formed associations to compete with them. We have seen that free persons had all along been to some extent employed in the cultivation of land as hired labourers, and, as we shall presently find, also as tenants on the great estates. How all this operated we shall understand when we examine the remarkable organization of the state introduced by Diocletian and his successors. (3) This organization established in the Roman world a personal and hereditary fixity of professions and situations which was not very far removed from the caste system of the East. The purpose of this was doubtless to resist by a strong internal consolidation the shock of the invasions, to secure public order, to enforce industrious habits, and to guarantee the financial resources of the state. Personal independence was largely sacrificed, but those still more important ends were in a great measure attained. The all-pervading nature of this discipline will be understood from the following particulars. Members of the administrative service were absolutely bound to their employments; they could not choose their wives or marry their daughters out of the collegia to which they respectively belonged, and they transmitted their obligations to their children. If they abandoned their posts, they were sought for everywhere and forced to return. In municipalities, even the *curiales*, or members of the local senates, were bound to their places and their functions; there were other members of the municipal service who might supply a substitute on condition of resigning to him their lands, but this power was rarely used; they commonly remained in their posts; their families, too, were bound to remain; they were attached to the collegia or other bodies to which they belonged. The soldier, procured for the army by conscription, served as long as his age fitted him for his duties, and his sons were bound to similar service. The same sort of compulsion appears to have been exercised upon those belonging to, at least, such free industrial corporations as were recognized and regulated by the state. Every one was treated, in fact, as a servant of the state, and was bound to furnish labour or money, or both; and the nature of his labour was permanently fixed for him; he was, in the language of the law, "conditionis laqueis irretitus." This general system, by diminishing the freeman's mastery over himself and his power to determine his occupation, reduced the interval between him and the slave; and the latter on the one hand, the free domestic servant and workshop labourer on the other, both passed insensibly into the common condition of serfdom. (4) The corresponding change, in the case of the rural slaves, took place through their being merged in the order of *coloni*. The Roman colonus was originally a free person who took land on lease, contracting to pay to the proprietor either a fixed sum annually or (when a *colonus partiarius*) a certain proportion of the produce of the farm. Under the emperors of the 4th century the name designated a cultivator, who, though personally free, was attached to the soil, and transmitted his condition to his descendants; and this became the regular status of the great mass of Roman cultivators. In sanctioning this personal and hereditary fixity, the law probably only recognized a state of things which had previously existed, having been spontaneously brought about by the circumstances of society, and especially by the needs of agriculture. The class of coloni appears to have been composed partly of tenants by contract who had incurred large arrears of rent and were detained on the estates as debtors (*obærati*), partly of foreign captives or immigrants who were settled in this condition on the land, and partly of small proprietors and other poor men who voluntarily adopted the status as an improvement in their position. They paid a fixed proportion of the produce (*pars agraria*) to the owner of the estate, and gave a determinate amount of labour (*operæ*) on the portion of the domain which he kept in his own hands (*mansus dominicus*). The law for a long time took no notice of these customary tenures, and did not systematically constitute them until the 4th century. It was indeed the requirements of the fiscus and the conscription which impelled the imperial Government to regulate the system. The coloni were inscribed (*adscripti*) on the registers of the census as paying taxes to the state, for which the proprietor was responsible, reimbursing himself for the amount. In a constitution of Constantine (332 A.D.) we find the colonus recognized as permanently attached to the land. If he abandoned his holding he was brought back and punished; and any one who received him had not only to restore him but to pay a penalty. He could not marry out of the domain; if he took for wife a colona of another proprietor, she was restored to her original locality, and the offspring of the union were divided between the estates. The children of a colonus were fixed in the same status, and could not quit the property to which they belonged. They and their descendants were retained, in the words of a law of Theodosius, "quodam æternitatis jure," and by no process could be relieved from their obligations. By a law of Anastasius, at the end of the 5th century, a colonus who had voluntarily come into an estate was by a tenure of thirty years for ever attached to it. The master (*dominus*)

could inflict on his coloni "moderate chastisement," and could chain them if they attempted to escape, but they had a legal remedy against him for unjust demands or injury to them or theirs In no case could the rent or the labour dues be increased The colonus could possess property of his own, but could not alienate it without the consent of the master Thus, whilst the members of the class were personally free, their condition had some incidents of a semi-servile character They are actually designated by Theodosius, though the lax language of the codes must not be taken too literally, "servi terræ cui nati sunt" And Salvian treats the proposition "coloni divitum fiunt" as equivalent to "vertuntur in servos" This is indeed an exaggeration, a deduction must always be made from the phrases of the mediæval Jeremiah, the colonatus was not an oppressive system, it afforded, on the contrary, real security against unreasonable demands and wanton disturbance, and it was a great advance on the system of cultivation by the *familia rustica* But the point which it is important for our present purpose to observe is, that there was a certain approximation between the condition of the colonus and the slave which tended towards the fusion of both in a single class To make this plain, we must go a little further into detail

Besides the coloni there were on a great estate—and those of the 4th century were on a specially large scale—a number of prædial slaves, who worked collectively under overseers on the part of the property which the owner himself cultivated But it was a common practice to settle certain of the slaves (and possibly also of the freedmen) on other portions of the estate, giving them small farms on conditions similar to those to which the coloni were subject These slaves are, in fact, described by Ulpian as *quasi coloni* They had their own households and were hence distinguished as *casati* In law these slaves were at first absolutely at the disposal of their masters, they had no property in the strict sense of the word, and could be sold to another proprietor and separated from their families But the landlord's interest and the general tone of feeling alike modified practice even before the intervention of legislation, they were habitually continued in their holdings, and came to possess in fact a perpetual and hereditary enjoyment of them By a law of Valentinian I (377) the sale of these slaves was interdicted unless the land they occupied were at the same time sold The legal distinction between the coloni and the slave tenants continued to exist after the invasions, but the practical difference was greatly attenuated The colonus often occupied a servile mansus, and the slave a mansus originally appropriated to a colonus Intermarriages of the two classes became frequent Already at the end of the 7th century it does not appear that the distinction between them had any substantial existence The servile tenures were, no less than the others, stable and hereditary, and the charges to be borne by the former were not necessarily the heavier

Whilst giving their due weight to the social and economic circumstances which tended thus to merge the free labourer and colonus on the one hand and the slave on the other in a common class of serfs, we must never leave out of account the directly moral agencies which worked towards the same result by modifying slavery Nor ought we to have in view only the influence of Christian doctrine and precept considered in themselves, we must regard them as constantly applied in daily life by an independent spiritual order, which was revered alike by the two classes whose relations it assisted in regulating, and whose general attitude towards slavery is sufficiently shown by the celebrated declaration of Gregory the Great

A review of what has been said will make it plain that the Northern invasions had little to do with the transition from slavery to serfdom Only two modes have been suggested in which they may possibly have accelerated the change It is not likely that the newly established proprietors would understand, or respect in practice, nice distinctions between classes of cultivators, they would probably regard the coloni and slaves, now that their conditions were so much assimilated, as standing on the same basis And, secondly, the Germans, if we may believe Tacitus, had in their original seats no menial slaves, whilst, on the other hand, they were familiar with the system of slaves settled on separate portions of a domain and paying a fixed share of the produce to its owner There may be a certain value in these considerations But, on the whole, it appears that, as in the case of the rise of the feudal system generally, so in the particular respect of the qualified personal freedom which accompanied it, the influence of the Northern nations was really of little account, and that both changes would have equally, though perhaps not so speedily, taken place if the invasions had never occurred

Disappearance of serfdom

Whilst ancient slavery was, as we have seen, a system fitted to endure under given social conditions, and had a definite political function to fulfil, serfdom, which succeeded when that function was exhausted, was a merely transitory condition, with no other destination than that of leading the working population up to a state of entire personal freedom How the serf in cities and towns became a free labourer for hire can be easily conceived, he doubtless in many cases purchased his liberty out of his earnings, and in others it was not the master's interest to retain his services at the cost of his maintenance The emancipation of this entire class was favoured by the movement (not, however, to be confounded with it) which established free industrial communities and gave them municipal jurisdiction But it is very difficult to trace the steps by which the rural serf was transmuted into a free tenant "The time and manner," says Adam Smith, "in which so important a revolution was brought about is one of the most obscure points in modern history" Smith himself attributes the change to two causes—(1) the greater advantage to the proprietor derived from the exertions of the cultivator when he worked entirely for himself, and (2) the encouragement which sovereigns, jealous of the great lords, gave to the villeins (under which term Smith seems to comprehend the whole mixed class of non-free tenants) to encroach on their authority To these economic and political reasons, though doubtless real and important, Smith appears to attribute too exclusive an efficacy, neglecting the moral and religious causes which conspired to the same result, especially the personal influence of the clergy, who were natural mediators between the serfs and the proprietors The serfs were best treated on the ecclesiastical estates, and many on private properties were liberated "pro amore Dei" and "pro remedio animæ"

Let us examine more particularly the circumstances of the transition in France and in England

France.

M Guérard has shown that from the conquest by Cæsar to the abolition of feudalism there was a steady improvement in the condition of the class originally enslaved He distinguishes three periods—one of slavery proper, lasting till the conquest of Gaul by the barbarians, the second, ending about the close of the reign of Charles the Bald (d 877), in which slavery is replaced by an intermediate state which he calls by the indeterminate name of "servitude," the rights of the *servus* being recognized, respected, and protected, if not yet in a sufficient degree by the civil laws, at least by those of the church and by social manners, and a third in which, under the developed regime of feudalism, serfdom proper is fully established and the serf-tenant has become simply a tributary under various appellations (*homme de corps* or *de pôté*, *main-*

mortable, taillable, serf, vilain). The three personal conditions here described coexisted to some extent in all these periods, one of them, however, greatly preponderating in each. Towards the end of the 9th century the serf-tenants were already proprietors of their holdings; under the third dynasty they were rather subjects than tenants, and the dues they paid were rather taxes than rents; they were, in short, vassals occupying the lowest round of the feudal ladder. Guérard enumerates as immediate causes which led to the liberation of serfs (besides the master's voluntary gift or bequest) their flight,—with the prescription which arose after a certain interval of absence,—ordination, redemption by themselves or others, marriages with women of higher status, and the action of law in the case of certain wrongs inflicted by the master. The church co-operated to the same result, as might be shown by many instances. Thus St Benedict of Aniane (d. 821), the reformer of the monasteries in the Carolingian territories, received a number of donations of lands from the faithful, but, whilst accepting them for his religious establishments, he enfranchised the serfs who inhabited them. All the serfs, not merely in a village, borough, or city, but in whole districts, were liberated by charters of sovereigns or lords. Such documents are most common in the 13th century. The general edicts of Louis X. (1315) and Philip V. (1318) are little more than recognitions of a *fait accompli*, and were dictated, at least in part, by financial motives. Some relics of serfdom continued to exist in local customs down to the Revolution, and were not abolished till the night of the 4th August 1789. But these survivals do not affect the truth of the proposition that the work of emancipation was essentially accomplished early in the 14th century.

England. Guérard has observed on the difficulty created by the ambiguity of the word *servus* in the mediæval authorities. In the study of English serfdom, even eminent writers like Robertson, Hallam, and Kemble have obscured the subject by the use of the term *slave*, sometimes in its proper sense, sometimes in relation to the *serf*. Dr Stubbs has avoided this equivocal nomenclature, and by attending more to social fact than to the letter of the law has placed the history of the class in a clear light. The slaves of Anglo-Saxon times were "regarded as the stock of their owner, . . . their offences against a third person he must answer for, as for the mischief done by his cattle; . . . they had no credibility, no legal rights; wrongs done to them were regarded as wrongs done to their master." Practice, indeed, was kinder to them than legal theory; as in the case of the Roman peculium, they were "in some unexplained way" allowed to keep their savings, and so to purchase their freedom; and "the spiritual law could enforce a penance on the master for ill treating them." There were laws of Ethelbert and Canute forbidding the sale of men to heathen masters, and the slave trade, the principal seat of which was Bristol, was put down by the preaching of St Wulfstan. The villein of Domesday Book is not a slave; he represents the Anglo-Saxon *ceorl*; he is an immovable cultivator, now regarded as customary tenant of a lord. The Norman knights probably confounded with the *villanus* the *bordarii* and other tenants who stood on a less favourable footing. Whilst the free ceorl became a villein, the *servus* (*theow*) disappeared altogether. The position which the class constituted by this fusion came to occupy was one "compatible with much personal comfort and some social ambition." The villeins "were safe in the possession of their homes; they had a remedy against the violence of their masters; they could, if they chose to renounce their holdings and take refuge in a town, become members of the guild, and there, when unclaimed for a year and a day, obtain the full rights of freemen; they could obtain manumission by the intervention of the church, which always proclaimed the liberation of the villein to be a work of merit on the part of the master. . . . Under a fairly good lord, under a monastery or a college, the villein enjoyed immunities and security that might be envied by his superiors; he had a ready tribunal for his wrongs, a voice in the management of his village; he might with a little contrivance redeem his children and start them in a higher state of life." Walter Map declares that in his time (12th century) the villeins were educating their ignoble offspring in the liberal arts. In the early part of the 14th century "it was by a mere legal form that the villeins were described as less than free." In the reign of Richard II. it seems that "the legal theory of their status has become hardened and sharpened so as to warrant almost wanton oppression," but social causes, on the other hand, have ameliorated their actual lot. It was not their normal condition that led to the insurrection of 1381, but the enforcement of the Statute of Labourers and the attempt of the lords to reassert legal claims which were practically obsolete. Serfdom died out in England without any special legislation against it. It survived in exceptional instances, as in France. Hallam mentions as the latest deed of enfranchisement one of Elizabeth in 1574 in favour of the bondmen on some of her manors; and it appears that in Scotland the workers in coal and salt mines were in a state of serfdom until they were liberated by Acts of the 15th and 39th years of the reign of George III.

Italy. Essentially similar movements took place in the other countries of the West. In Italy "the 11th and 12th centuries," says Hallam, "saw the number of slaves" (by which word he means serfs) "begin to decrease; early in the 15th a writer quoted by Muratori speaks of them as no longer existing. . . . The greater part," he adds, "of the peasants in some countries of Germany had acquired their liberty before the end of the 13th century; in other parts . . . they remained in a sort of villenage till the present age." The most rigorous forms of serfdom (*Leibeigenschaft*) existed in those German districts which were once Wendish,—as Lusatia, Pomerania, and Mecklenburg,—and in Holstein. The last remains of the system in Germany were abolished in 1832 and 1848. In Castile the serfs were slowly converted into *solariegos*, who cultivated the land of the lord under obligations similar to those of the colonus. Alphonso X. (El Sabio) declared that the solariego could quit his holding when he wished, though he could not alienate it or demand anything for his improvements. Alphonso XI. (El Justiciero) decreed that no lord should take the *solar* (holding) from the tenant, nor from his sons or grandsons, so long as they paid the fixed dues. They thus became irremovable, and their tenures were hereditary. Germany. Spain.

By these gradual processes every form of servitude disappeared from the social order of western Europe, whilst at the same time was bequeathed to the modern world the inexorable problem, still but partially solved, of the definitive position of the classes whose origin is traceable to that condition.

Modern slave trade. But not very long after the disappearance of serfdom in the most advanced communities comes into sight the new system of colonial slavery, which, instead of being the spontaneous outgrowth of social necessities and subserving a temporary need of human development, was politically as well as morally a monstrous aberration, and never produced anything but evil.

Spanish colonies. In 1442, when the Portuguese under Prince Henry the Navigator were exploring the Atlantic coast of Africa, one of his officers, Antam Gonsalves, who had captured some Moors, was directed by the prince to carry them back to Africa. He received from the Moors in exchange for them ten blacks and a quantity of gold dust. This excited the cupidity of his fellow countrymen; and they fitted out a large number of ships for the trade, and built several forts on the African coast. Many negroes were brought into Spain from these Portuguese settlements, and the colonial slave trade first appears in the form of the introduction into the newly-discovered western world of children or descendants of these negroes. When Ovando was sent out in 1502 as governor of Hispaniola, whilst regulations, destined to prove illusory, were made for the protection of the natives of the island, permission was given to carry to the colony negro slaves, born in Seville and other parts of Spain, who had been instructed in the Christian faith. It appears from a letter of Ovando in 1503 that there were at that time numbers of negroes in Hispaniola; he requested that no more might be permitted to be brought out. In 1510 and the following years King Ferdinand ordered a number of Africans to be sent to that colony for the working of the mines.

Before this time Columbus had proposed an exchange of his Carib prisoners as slaves against live stock to be furnished to Hispaniola by Spanish merchants. Infidels, he represented, would thus be converted, the royal treasury enriched by a duty on the slaves, and the colonists supplied with live stock free of expense. He actually sent home in the ships of Antonio Torres, in 1494, above 500 Indian prisoners taken in wars with the caciques, who, he suggested, might be sold as slaves at Seville. But, after a royal order had been issued for their sale, Queen Isabella, interested by what she had heard of the gentle and hospitable character of the natives and of their docility, procured a letter to be written to Bishop Fonseca, the superintendent of Indian affairs, suspending the order until inquiry should be made into the causes for which they had been made prisoners, and into the lawfulness of their sale. Theologians differed on the latter question, and

Isabella directed that these Indians should be sent back to their native country, and that a policy of conciliation should be followed there instead of one of severity.

Bartolomé de las Casas, the celebrated bishop of Chiapa, accompanied Ovando to Hispaniola, and was a witness of the cruelties from which the Indians suffered under his administration. He came to Spain in 1517 to obtain measures in their favour, and he then made the suggestion to Charles that each Spanish resident in Hispaniola should have licence to import a dozen negro slaves. Las Casas, in his *Historia de las Indias* (lib iii cap 101), frankly confesses the grave error into which he thus fell. "This advice that licence should be given to bring negro slaves to these lands the clerigo Casas first gave, not considering the injustice with which the Portuguese take them and make them slaves; which advice, after he had apprehended the nature of the thing, he would not have given for all he had in the world." Other good men appear to have given similar advice about the same time, and, as has been shown, the practice was not absolutely new; indeed the young king had in 1516, whilst still in Flanders, granted licences to his courtiers for the importation of negroes into the colonies, though Ximenes, as regent of Castile, by a decree of the same year forbade the practice. The suggestion of Las Casas was no doubt made on the ground that the negroes could, better than the Indians, bear the labour in the mines, which was rapidly exhausting the numbers of the latter.[1] He has sometimes on this plea been exonerated from all censure; but, as we have seen, he did not exculpate himself; and, though entitled to honour for the zeal and perseverance which he showed on behalf of the natives of the New World, he must in justice bear the blame due from posterity for his violation or neglect of moral principle. His advice was unfortunately adopted. "Charles," says Robertson, "granted a patent to one of his Flemish favourites, containing an exclusive right" of supplying 4000 negroes annually to Hispaniola, Cuba, Jamaica, and Porto Rico. "The favourite sold his patent to some Genoese merchants for 25,000 ducats"; these merchants obtained the slaves from the Portuguese; and thus was first brought into a systematic form that odious "commerce between Africa and America which has since been carried on to such an amazing extent," the action of the Spaniards being "imitated by all the nations of Europe who have acquired territories in the warmer climates of the New World."

England. The first Englishman who engaged in the hateful traffic was Captain John HAWKINS (*q.v.*). The English slave traders were at first altogether occupied in supplying the Spanish settlements. Indeed the reign of Elizabeth passed without any English colony having been permanently established in America. But in 1620 a Dutch ship from the coast of Guinea visited Jamestown in Virginia, and sold a part of her cargo of negroes to the tobacco-planters. This was the first beginning of slavery in British America; the number of negroes was afterwards continually increased—though apparently at first slowly—by importation, and the field-labour was more and more performed by servile hands, so that in 1790 the State of Virginia, which is only a small part of the original colony so named, contained 200,000 negroes.

The African trade of England was long in the hands of exclusive companies; but by an Act of the first year of William and Mary it became free and open to all subjects of the crown. The African Company, however, continued to exist, and obtained from time to time large parliamentary grants. By the treaty of Utrecht the asiento,[2] or contract for supplying the Spanish colonies with 4800 negroes annually, which had previously passed from the Dutch to the French, was transferred to Great Britain; an English company was to enjoy the monopoly for a period of thirty years from 1st May 1713. But the contract came to an end in 1739, when the complaints of the English merchants on one side and of the Spanish officials on the other rose to such a height that Philip V declared his determination to revoke the asiento, and Sir Robert Walpole was forced by popular feeling into war with Spain. Between 1680 and 1700 about 140,000 negroes were exported by the African Company, and 160,000 more by private adventurers, making a total of 300,000. Between 1700 and the end of 1786 as many as 610,000 were transported to Jamaica alone, which had been an English possession since 1655. Bryan Edwards estimated the total import into all the British colonies of America and the West Indies from 1680 to 1786 at 2,130,000, being an annual average of 20,095. But this, he admits, is much less than was in his time commonly supposed. The British slave trade reached its utmost extension shortly before the War of American Independence. It was then carried on principally from Liverpool, but also from London, Bristol, and Lancaster; the entire number of slave ships sailing from those ports was 192, and in them space was provided for the transport of 47,146 negroes. During the war the number decreased, but on its termination the trade immediately revived. When Edwards wrote (1791), the number of European factories on the coasts of Africa was 40; of these 14 were English, 3 French, 15 Dutch, 4 Portuguese, and 4 Danish. As correct a notion as can be obtained of the numbers annually exported from the continent about the year 1790 by traders of the several European countries engaged in the traffic is supplied by the following statement:—"By the British, 38,000; by the French, 20,000; by the Dutch, 4000; by the Danes, 2000; by the Portuguese, 10,000; total 74,000." Thus more than half the trade was in British hands. "At present," said Robertson, writing in 1791, "the number of negro slaves in the settlements of Great Britain and France in the West Indies exceeds a million; and, as the establishment of servitude has been found, both in ancient and modern times, extremely unfavourable to population, it requires an annual importation of at least 58,000 to keep up the stock." The slaves in the Spanish dominions and in North America, he thought, probably amounted to an additional million.

Effects of the slave trade. The hunting and stealing of human beings to make them slaves, which were already practised in Africa for the supply of the central states of that continent, as well as of the markets of northern Africa, Turkey, and other Mohammedan countries, were greatly aggravated by the demand of the European colonies. The native chiefs engaged in forays, sometimes even on their own subjects, for the purpose of procuring slaves to be exchanged for Western commodities. They often set fire to a village by night and captured the inhabitants when trying to escape. Thus all that was shocking in the barbarism of Africa was multiplied and intensified by this foreign stimulation. To the miseries thus produced, and to those suffered by the captives in their removal to the coast were added the horrors of the middle passage. Exclusive of the slaves who died before they sailed from Africa, 12½ per cent. were lost during their passage to the West Indies; at Jamaica 4½ per cent. died whilst in the harbours or before the sale, and one third more in the "seasoning." Thus, out of every lot of 100 shipped from Africa 17 died in about 9 weeks, and not more than 50 lived to be effective labourers in the islands. The circumstances of their subsequent life on the plantations were not favourable to the increase of their numbers. In Jamaica there were in 1690 40,000; from that year till 1820 there were imported 800,000, yet at the latter date there were only 340,000 in the island. One cause which prevented the natural increase of population was the inequality in the numbers of the sexes; in Jamaica alone there was in 1789 an excess of 30,000 males.

Movement against the slave trade in England. It may be truly said that from the latter part of the 17th century, when the nature of the slave trade began to be understood by the public, all that was best in England was adverse to it. Among those who denounced it—besides some whose names are now little known, but are recorded with the honour they deserve in the pages of Clarkson—were Baxter, Sir Richard Steele (in *Inkle and Yarico*), the poets Southern (in *Oroonoko*), Pope, Thomson, Shenstone, Dyer, Savage, and above all Cowper (see his *Charity*, and *Task*, bk 2), Thomas Day (author of *Sandford and Merton*), Sterne, Warburton, Hutcheson, Beattie, John Wesley, Whitfield, Adam Smith, Millar, Robertson, Dr Johnson, Paley, Gregory, Gilbert Wakefield, Bishop Porteus, Dean Tucker. The question of the legal existence of slavery in Great Britain and Ireland was raised in consequence of an opinion given in 1729 by York and Talbot, attorney-general and solicitor-general at the time,

[1] The Spaniards, in the space of fifteen years subsequent to the discovery of the West Indies, had, as Robertson mentions, reduced the natives of Hispaniola from a million to 60,000.

[2] The Spaniards were prevented from forming establishments on the African coast by the Bull of Demarcation ("Inter cætera") of Pope Alexander VI (1493), which forbade their acquiring territory to the east of the meridian line of 100 miles west of the Azores. They could therefore supply their American possessions with slaves only by contracts with other powers.

to the effect that a slave by coming into those countries from the West Indies did not become free, and might be compelled by his master to return to the plantations Chief-Justice Holt had expressed a contrary opinion, and the matter was brought to a final issue by Mr Granville Sharp in the case of the negro Somerset It was decided by Lord Mansfield, in the name of the whole bench, on June 22d 1772, that as soon as a slave set his foot on the soil of the British islands he became free In 1776 it was moved in the House of Commons by David Hartley, son of the author of *Observations on Man*, that "the slave trade was contrary to the laws of God and the rights of men", but this motion—the first which was made on the subject—failed, public opinion on the question was far from being yet fully ripe

The first persons in England who took united practical action against the slave trade were the Quakers, following the expression of sentiment which had emanated so early as 1671 from their founder George Fox In 1727 they declared it to be "not a commendable or allowed" practice, in 1761 they excluded from their Society all who should be found concerned in it, and issued appeals to their members and the public against the system In 1783 there was formed amongst them an association "for the relief and liberation of the negro slaves in the West Indies, and for the discouragement of the slave trade on the coast of Africa" This was the first society established in England for the purpose The Quakers in America had taken action on the subject still earlier than those in England The Pennsylvanian Quakers advised their members against the trade in 1696, in 1754 they issued to their brethren a strong dissuasive against encouraging it in any manner, in 1774 all persons concerned in the traffic, and in 1776 all slave holders who would not emancipate their slaves, were excluded from membership The Quakers in the other American provinces followed the lead of their brethren in Pennsylvania The individuals amongst the American Quakers who laboured most earnestly and indefatigably on behalf of the Africans were John Woolman (1720–1773) and Anthony Benezet (1713–1784), the latter a son of a French Huguenot driven from France by the revocation of the edict of Nantes The former confined his efforts chiefly to America and indeed to his coreligionists there, the latter sought, and not without a large measure of success, to found a universal propaganda in favour of abolition A Pennsylvanian society was formed in 1774 by James Pemberton and Dr Benjamin Rush, and in 1787 (after the war) was reconstructed on an enlarged basis under the presidency of Franklin Other similar associations were founded about the same time in different parts of the United States The next important movement took place in England Dr Peckard, vice-chancellor of the university of Cambridge, who entertained strong convictions against the slave trade, proposed in 1785 as subject for a Latin prize dissertation the question, "An liceat invitos in servitutem dare" Thomas Clarkson resolved to compete for the prize Reading Anthony Benezet's *Historical Account of Guinea* and other works in the course of his study of the subject, he became so powerfully impressed with a sense of the vile and atrocious nature of the traffic that he ere long determined to devote his life to the work of its abolition, a resolution which he nobly kept His essay, which obtained the first prize, was translated into English in an expanded form by its author, and published in 1786 with the title *Essay on the Slavery and Commerce of the Human Species* In the process of its publication he was brought into contact with several persons already deeply interested in the question, amongst others with Granville Sharp, William Dillwyn (an American by birth, who had known Benezet), and the Rev James Ramsay, who had lived nineteen years in St Christopher, and had published an *Essay on the Treatment and Conversion of the African Slaves in the British Sugar Colonies* The distribution of Clarkson's book led to his forming connexions with many persons of influence, and especially with William Wilberforce, who, having already occupied himself with the subject, went fully into the evidence bearing on it which Clarkson laid before him, and, as the result of his inquiries, undertook the parliamentary conduct of the movement which was now decisively inaugurated A committee was formed on 22d May 1787 for the abolition of the slave trade, under the presidency of Granville Sharp, which after twenty years of labour succeeded, with the help of eminent public men, in effecting the object of its foundation, and thus removing a grave blot on the character of the British nation, and mitigating one of the greatest evils that ever afflicted humanity It is unquestionable that the principal motive power which originated and sustained their efforts was Christian principle and feeling The most earnest and unremitting exertions were made by the persons so associated in investigating facts and collecting evidence, in forming branch committees and procuring petitions, in the instruction of the public and in the information and support of those who pleaded the cause in parliament To the original members were afterwards added several remarkable persons, amongst whom were Josiah Wedgwood, Bennet Langton (Dr Johnson's friend), and, later, Zachary Macaulay, Henry Brougham, and James Stephen

In consequence of the numerous petitions presented to parliament, a committee of privy council was appointed by the crown in 1788 to inquire concerning the slave trade, and Mr Pitt moved that the House of Commons should early in the next session take the subject into consideration Wilberforce's first motion for a committee of the whole House upon the question was made on 19th March 1789, and this committee proceeded to business on 12th May of the same year After an admirable speech, Wilberforce laid on the table twelve resolutions which were intended as the basis of a future motion for the abolition of the trade The discussion of these was postponed to the next session, and in 1790–91 evidence was taken upon them At length, on 18th April of the latter year, a motion was made for the introduction of a bill to prevent the further importation of slaves into the British colonies in the West Indies Opinion had been prejudiced by the insurrections in St Domingo and Martinique, and in the British island of Dominica, and the motion was defeated by 163 votes against 88 Legislative sanction was, however, given to the establishment of the Sierra Leone Company, for the colonization of a district on the west coast of Africa and the discouragement of the slave trade there It was hoped at the time that that place would become the centre from which the civilization of Africa would proceed, but this expectation was not fulfilled On 2d April 1792 Wilberforce again moved that the trade ought to be abolished, an amendment in favour of gradual abolition was carried, and it was finally resolved that the trade should cease on 1st January 1796 When a similar motion was brought forward in the Lords the consideration of it was postponed to the following year, in order to give time for the examination of witnesses by a committee of the House A bill in the Commons in the following year to abolish that part of the trade by which British merchants supplied foreign settlements with slaves was lost on the third reading, it was renewed in the Commons in 1794 and carried there, but defeated in the Lords Then followed several years during which efforts were made by the abolitionists

in parliament with little success. But in 1806, Lord Grenville and Fox having come into power, a bill was passed in both Houses to put an end to the British slave trade for foreign supply, and to forbid the importation of slaves into the colonies won by the British arms in the course of the war. On 10th June of the same year Fox brought forward a resolution "that effectual measures should be taken for the abolition of the African slave trade in such a manner and at such a period as should be deemed advisable," which was carried by a large majority. A similar resolution was successful in the House of Lords. A bill was then passed through both Houses forbidding the employment of any new vessel in the trade. Finally, in 1807, a bill was presented by Lord Grenville in the House of Lords providing for the abolition of the trade, was passed by a large majority, was then sent to the Commons (where it was moved by Lord Howick), was there amended and passed, and received the royal assent on 25th March. The bill enacted that no vessel should clear out for slaves from any port within the British dominions after 1st May 1807, and that no slave should be landed in the colonies after 1st March 1808.

In 1807 the African Institution was formed, with the primary objects of keeping a vigilant watch on the slave traders and procuring, if possible, the abolition of the slave trade by the other European nations. It was also to be made an instrument for promoting the instruction of the negro races and diffusing information respecting the agricultural and commercial capabilities of the African continent.

The Act of 1807 was habitually violated, as the traders knew that, if one voyage in three was successful, they were abundantly remunerated for their losses. This state of things, it was plain, must continue as long as the trade was only a contraband commerce, involving merely pecuniary penalties. Accordingly, in 1811, Brougham carried through parliament a bill declaring the traffic to be a felony punishable with transportation. Some years later another Act was passed, making it a capital offence; but this was afterwards repealed. The law of 1811 proved effectual, and brought the slave trade to an end so far as the British dominions were concerned. Mauritius, indeed, continued it for a time. That island, which had been ceded by France in 1810, three years after the abolition, had special facilities for escaping observation in consequence of the proximity of the African coast; but it was soon obliged to conform.

France. The abolition of the French slave trade was preceded by stormy struggles and by many deplorable excesses. The western part of St Domingo, nominally belonging to Spain, had been occupied by buccaneers, who were recognized and supported by the French Government, and had been ceded to France at the peace of Ryswick in 1697. So vast was the annual importation of enslaved negroes into this colony before 1791 that the ratio of the blacks to the whites was as 16 to 1. In that year there were in French St Domingo 480,000 blacks, 24,000 mulattoes, and only 30,000 whites. The French law for the regulation of slavery in the plantations, known as the *Code Noir* (framed under Louis XIV in 1685), was humane in its spirit; but we are informed that its provisions were habitually disregarded by the planters, whilst the free mulattoes laboured under serious grievances and were exposed to irritating indignities. A "Société des Amis des Noirs" was formed in Paris in 1788 for the abolition, not only of the slave trade, but of slavery itself. The president was Condorcet, and amongst the members were the Duc de la Rochefoucault, the Abbé Gregoire, Brissot, Clavière, Pétion, and La Fayette; Mirabeau was an active sympathizer. The great motor of the parallel effort in England was the Christian spirit; in France it was the enthusiasm of humanity which was associated with the revolutionary movement. There were in 1789 a number of mulattoes in Paris, who had come from St Domingo to assert the rights of the people of colour in that colony before the national assembly. The Declaration of the Rights of Man in August 1789 seemed to meet their claims; but in March 1790 the assembly, alarmed by rumours of the discontent and disaffection of the planters in St Domingo, passed a resolution that it had not been intended to comprehend the internal government of the colonies in the constitution framed for the mother country, and added that the assembly would not cause any innovation to be made, directly or indirectly, in any system of commerce in which the colonies were already concerned,—a declaration which could only be interpreted as sanctioning the continuance of the slave trade. Vincent Ogé, one of the mulatto delegates in Paris, disgusted at the overthrow of the hopes of his race, returned to St Domingo, and on landing in October 1790 addressed a letter to the governor announcing his intention of taking up arms on behalf of the mulattoes if their wrongs were not redressed. He rose accordingly with a few followers, but was soon defeated and forced to take refuge in the Spanish part of the island. He was afterwards surrendered, tried, and sentenced to be broken on the wheel. When the news of this reached Paris, it created a strong feeling against the planters; and on the motion of the Abbé Gregoire it was resolved by the assembly on 15th May 1791 "that the people of colour resident in the French colonies, born of free parents, were entitled to, as of right, and should be allowed, the enjoyment of all the privileges of French citizens, and among others those of being eligible to seats both in the parochial and colonial assemblies." On the 23d August a rebellion of the negroes broke out in the northern province of St Domingo, and soon extended to the western province, where the mulattoes and blacks combined. Many enormities were committed by the insurgents, and were avenged with scarcely inferior barbarity. The French assembly, alarmed by these scenes, and fearing the loss of the colony, repealed on 24th September the decree of the preceding May. This lamentable vacillation put an end to all hope of a reconciliation of parties in the island. Civil commissioners sent out from France quarrelled with the governor and called the revolted negroes to their assistance. The white inhabitants of Cape François were massacred and the city in great part destroyed by fire. The planters now offered their allegiance to Great Britain; and an English force landed in the colony. But it was insufficient to encounter the hostility of the republican troops and the revolted negroes and mulattoes; it suffered dreadfully from disease, and was obliged to evacuate the island in 1798. On the departure of the British the government remained in the hands of Toussaint l'Ouverture, the noblest type ever produced by the African race. Slavery had disappeared; the blacks were employed as hired servants, receiving for their remuneration the third part of the crops they raised; and the population was rapidly rising in civilization and comfort. The whole island was now French, the Spanish portion having been ceded by the treaty of Basel. The wish of Toussaint was that St Domingo should enjoy a practical independence whilst recognizing the sovereignty and exclusive commercial rights of France. Of the violent and treacherous conduct of Bonaparte towards the island and its eminent chief we cannot here give an account; the final issue was that the blacks drove from their soil the forces sent to subdue them, and founded a constitution of their own, which was more than once modified. There can be no doubt that the Government of the Restoration, in seeking to obtain possession of the island, had the intention of re-establishing slavery, and even of reopening the slave trade for the purpose of recruiting the diminished population. But Bonaparte abolished that trade during the Hundred Days, though he also failed to win back the people of St Domingo, or, as it was now called by its original name, Hayti, to obedience. The Bourbons, when again restored, could not reintroduce the slave trade; the notion of conquering the island had to be given up; and its independence was formally recognized in 1825. Thus France lost her most important colonial possession, which had yielded produce to an amount almost as great as that of all the rest of the West Indies; and the negro race obtained its first and hitherto its only independent settlement outside the African continent.

England had not been the first European power to abolish the slave trade; that honour belongs to Denmark; a royal order was issued 16th May 1792 that the traffic should cease in the Danish possessions from the end of 1802. The United States had in 1794 forbidden any participation by American subjects in the slave trade to foreign countries; they now prohibited the importation of slaves from Africa into their own dominion. This Act was passed 2d March 1807; it did not, however, come into force till 1st January 1808. At the congress of Vienna (opened November 1, 1814) the principle was acknowledged that the slave trade should be abolished as soon as possible, but the determination of the limit of time was reserved for separate negotiation between the powers. It had been provided in a treaty between France and Great Britain, May 30, 1814, that no foreigner should Progress of the movement.

in future introduce slaves into the French colonies, and that the trade should be absolutely interdicted to the French themselves after June 1, 1819 This postponement of abolition was dictated by the wish to introduce a fresh stock of slaves into Hayti, if that island should be recovered Bonaparte, as we have seen, abolished the French slave trade during his brief restoration, and this abolition was confirmed at the second peace of Paris, November 20, 1815, but it was not effectually carried out by French legislation until March 1818 In January 1815 Portuguese subjects were prohibited from prosecuting the trade north of the equator, and the term after which the traffic should be everywhere unlawful was fixed to end on 21st January 1823, but was afterwards extended to February 1830, England paid £300,000 as a compensation to the Portuguese A royal decree was issued on 10th December 1836 forbidding the export of slaves from any Portuguese possession But this decree was often violated It was agreed that the Spanish slave trade should come to an end in 1820, England paying to Spain an indemnification of £400,000 The Dutch trade was closed in 1814, the Swedish had been abolished in 1813 By the peace of Ghent, December 1814, the United States and England mutually bound themselves to do all in their power to extinguish the traffic It was at once prohibited in several of the South American states when they acquired independence, as in La Plata, Venezuela, and Chili In 1831 and 1833 Great Britain entered into an arrangement with France for a mutual right of search within certain seas, to which most of the other powers acceded, and by the Ashburton treaty (1842) with the United States provision was made for the joint maintenance of squadrons on the west coast of Africa By all these measures the slave trade, so far as it was carried on under the flags of European nations or for the supply of their colonies, ceased to exist

Anti slavery movement

Meantime another and more radical reform had been in preparation and was already in progress, namely, the abolition of slavery itself in the foreign possessions of the several states of Europe When the English slave trade had been closed, it was found that the evils of the traffic, as still continued by several other nations, were greatly aggravated In consequence of the activity of the British cruisers the traders made great efforts to carry as many slaves as possible in every voyage, and practised atrocities to get rid of the slaves when capture was imminent It was, besides, the interest of the cruisers, who shared the price of the captured slave-ship, rather to allow the slaves to be taken on board than to prevent their being shipped at all Thrice as great a number of negroes as before, it was said, was exported from Africa, and two-thirds of these were murdered on the high seas It was found also that the abolition of the British slave trade did not lead to an improved treatment of the negroes in the West Indies The slaves were overworked now that fresh supplies were stopped, and their numbers rapidly decreased In 1807 there were in the West Indies 800,000, in 1830 they were reduced to 700,000 It became more and more evident that the root of the evil could be reached only by abolishing slavery altogether At the same time, by the discussions which had for years gone on throughout English society on the subject of the slave trade, men's consciences had been awakened to question the lawfulness of the whole system of things out of which that trade had taken its rise

An appeal was made by Wilberforce in 1821 to Thomas Fowell Buxton to undertake the conduct of this new question in parliament An anti slavery society was established in 1823, the principal members of which, besides Wilberforce and Buxton, were Zachary Macaulay, Dr Lushington, and Lord Suffield Buxton moved on 5th May of the same year that the House should take into consideration the state of slavery in the British colonies The object he and his associates had then in view was gradual abolition by establishing something like a system of serfdom for existing slaves, and passing at the same time a measure emancipating all their children born after a certain day Canning carried against Buxton and his friends a motion to the effect that the desired ameliorations in the condition and treatment of the slaves should be recommended by the home Government to the colonial legislatures, and enforced only in case of their resistance, direct action being taken in the single instance of Trinidad, which, being a crown colony, had no legislature of its own A well conceived series of measures of reform was accordingly proposed to the colonial authorities Thereupon a general outcry was raised by the planters at the acquiescence of the Government in the principles of the anti slavery party A vain attempt being made in Demerara to conceal from the knowledge of the slaves the arrival of the order in council, they became impressed with the idea that they had been set free, and accordingly refused to work, and, compulsion being resorted to, offered resistance Martial law was proclaimed, the disturbances were repressed with great severity, and the treatment of the missionary Smith, which was taken up and handled with great ability by Brougham, awakened strong feeling in England against the planters The question, however, made little progress in parliament for some years, though Buxton, William Smith, Lushington, Brougham, Mackintosh, Butterworth, and Denman, with the aid of Z Macaulay, James Stephen, and others, continued the struggle, only suspending it during a period allowed to the local legislatures for carrying into effect the measures expected from them In 1828 the free people of colour in the colonies were placed on a footing of legal equality with their fellow citizens In 1830 the public began to be aroused to a serious prosecution of the main issue It was becoming plain that the planters would take no steps tending to the future liberation of the slaves, and the leaders of the movement determined to urge the entire abolition of slavery at the earliest practicable period The Government continued to hesitate and to press for mitigations of the existing system At length in 1833 the ministry of Earl Grey took the question in hand and carried the abolition with little difficulty, the measure passing the House of Commons on 7th August 1833 and receiving the Royal assent 28th of the same month A sum of 20 millions sterling was voted as compensation to the planters A system of apprenticeship for seven years was established as a transitional preparation for liberty The slaves were bound to work for their masters during this period for three-fourths of the day, and were to be liable to corporal punishment if they did not give the due amount of labour The master was, in return, to supply them with food and clothing All children under six years of age were to be at once free, and provision was to be made for their religious and moral instruction Many thought the postponement of emancipation unwise Immediate liberation was carried out in Antigua, and public tranquillity was so far from being disturbed there that the Christmas of 1833 was the first for twenty years during which martial law was not proclaimed in order to preserve the peace Notwithstanding protracted and strenuous opposition on the part of the Government, the House of Commons passed a resolution against the continuance of the transitional system When this was done the local legislatures saw that the slaves would no longer work for the masters, they accordingly cut off two years of the indentured apprenticeship, and gave freedom to the slaves in August 1838 instead of 1840

The example of Great Britain was gradually followed by the other European states, and some American ones had already taken action of the same kind The immediate emancipation of the slaves in the French colonies was decreed by the Provisional Government of 1848 In 1858 it was enacted that every slave belonging to a Portuguese subject should be free in twenty years from that date, a system of tutelage being established in the meantime This law came into operation on 29th April 1878, and the status of slavery was thenceforth illegal throughout the Portuguese possessions The Dutch emancipated their slaves in 1863 Several of the Spanish American states, on declaring their independence, had adopted measures for the discontinuance of slavery within their limits It was abolished by a decree of the Mexican republic on 15th September 1829 The Government of Buenos Ayres enacted that all children born to slaves after 31st January 1813 should be free, and in Colombia it was provided that those born after 16th July 1821 should be liberated on attaining their eighteenth year

Three of the most important slave systems still remained in which no steps towards emancipation had been taken—those of the Southern United States, of Cuba, and of Brazil

United States

Slavery was far from being approved in principle by the most eminent of the fathers of the American Union Washington in his will provided for the emancipation of his own slaves, he said to Jefferson that it was "among

his first wishes to see some plan adopted by which slavery in his country might be abolished by law," and again he wrote that to this subject his own suffrage should never be wanting. John Adams declared his abhorrence of the practice of slaveholding, and said that "every measure of prudence ought to be assumed for the eventual total extirpation of slavery from the United States." Franklin's opinions we have already indicated; and Madison, Hamilton, and Patrick Henry all reprobated the principle of the system. Jefferson declared that in the presence of the institution "he trembled for his country when he remembered that God was just." The last-named statesman, at the first continental congress after the evacuation by the British forces, proposed a draft ordinance (1st March 1784) for the government of the territory—including the present Tennessee, Alabama, and Mississippi—ceded already or to be ceded by individual States to the United States; and it was an article of this ordinance that "after the year 1800 there should be neither slavery nor involuntary servitude in any of the said States, otherwise than in punishment of crime." This proviso, however, was lost. At the convention of Philadelphia in 1787, where the constitution was settled, the sentiments of the framers were against slavery; but South Carolina and Georgia insisted on its recognition as a condition of their joining the Union, and even an engagement for the mutual rendition of fugitive slaves was embodied in the federal pact. The *words* "slave" and "slavery" were, however, excluded from the constitution, "because," as Madison says, "they did not choose to admit the right of property in man" in direct terms; and it was at the same time provided that Congress might interdict the foreign slave trade after the expiration of twenty years. It must not be forgotten that either before or soon after the formation of the Union the Northern States—beginning with Vermont in 1777, and ending with New Jersey in 1804—either abolished slavery or adopted measures to effect its gradual abolition within their boundaries. But the principal operation of (at least) the latter change was simply to transfer Northern slaves to Southern markets.

We cannot follow in detail the several steps by which the slave power for a long time persistently increased its influence in the Union. The acquisition of Louisiana—including the State so named, Arkansas, Missouri, and Kansas—(1803), though not made in its interest, the Missouri compromise (1820), the annexation of Texas (1845), the Fugitive Slave Law (1850), the Kansas-Nebraska bill (1854), the Dred Scott decision (1856), the attempts to acquire Cuba (1854) and to reopen the foreign slave trade (1859-60), were the principal steps—only some of them successful—in its career of aggression. They roused a determined spirit of opposition, founded on deep-seated convictions. The pioneer of the more recent abolitionist movement was Benjamin Lundy (1789–1839). He was followed by William Lloyd Garrison (1805–1879), Elijah P. Lovejoy (1802–1837)—a martyr, if ever there was one—Wendell Phillips, Charles Sumner, John Brown (b. 1800, hanged 1859), all of whom were in their several ways leading apostles or promoters of the cause. The best intellect of America outside the region of practical politics has been on the anti-slavery side. William E. Channing, R. W. Emerson, the poets Bryant, Longfellow, pre-eminently Whittier, and more recently Whitman, have spoken on this theme with no uncertain sound. The South, and its partisans in the North, made desperate efforts to prevent the free expression of opinion respecting the institution, and even the Christian churches in the slave States used their influence in favour of the maintenance of slavery. But in spite of every such effort opinion steadily grew. Public sentiment in the North was deeply stirred by the *Uncle Tom's Cabin* of Mrs Harriet Beecher Stowe (1852), which, as Senior said, under the disguise of a novel was really a pamphlet against the Fugitive Slave Law. It gradually became apparent that the question could not be settled without an armed conflict. The designation of Abraham Lincoln as president in November 1860 was the signal for the rising of the South. The North at first took arms simply to maintain the Union; but the far-sighted politicians from the first, and soon the whole nation, saw that the [real] [issue] was the continued existence or the total abolition of slavery. See United States.

The war was closed by the surrender at Appomattox (9th April 1865), but already in 1862 slavery in the Territories had been abolished by Congress; on 22d of September of the same year Lincoln had issued his proclamation of freedom to the slaves; and in 1864 a constitutional amendment had been passed abolishing and for ever prohibiting slavery throughout the United States.

Cuba.

The Spanish slave code, promulgated in 1789, is admitted on all hands to have been very humane in its character; and, in consequence of this, after Trinidad had become an English possession, the anti-slavery party resisted—and successfully—the attempt of the planters (1811) to have the Spanish law in that island replaced by the British. But, notwithstanding this mildness of the code, so habitually and glaringly were its provisions violated in the colonies of Spain, that Dr R. R. Madden, who had personal knowledge of the affairs of Cuba, declared in 1840 that "slavery in Cuba was more destructive to human life, more pernicious to society, degrading to the slave and debasing to the master, more fatal to health and happiness, than in any other slaveholding country on the face of the habitable globe." "It is in Cuba at this day," wrote Cairnes in 1862, ". . . that we see in the servile class the coarsest fare, the most exhausting and unremitting toil, and even the absolute destruction of a portion of its numbers every year by the slow torture of overwork and insufficient sleep and rest." The slave population of the island was estimated in 1792 at 84,000; in 1817 at 179,000; in 1827 at 286,000; and in 1843 at 436,000. An Act was passed by the Spanish legislature in 1870, providing that every slave who had then passed, or should thereafter pass, the age of sixty should be at once free, and that all yet unborn children of slaves should also be free. The latter, however, were to be maintained at the expense of the proprietors up to their eighteenth year, and during that time to be kept, as apprentices, to such work as was suitable for their age. This is known as the Moret Law, having been carried through the house of representatives by Señor Moret y Prendergast, then minister for the colonies. By the census of 1867 there was in Cuba a total population of 1,370,211 persons, of whom 764,750 were whites and 605,461 black or coloured; and of the latter number 225,938 were free and 379,523 were slaves. In 1873 the Cubans roughly estimated the population at 1,500,000,—of whom 500,000, or one-third, were slaves. Mr Crowe, consul-general in the island, has lately (1885) stated that "the institution is rapidly dying,—that in a year, or at most two, slavery, even in its present mild form, will be extinct."

Brazil.

There was a convention between Great Britain and Brazil in 1826 for the abolition of the slave trade, but it was habitually violated in spite of the English cruisers. In 1830 the traffic was declared piracy by the emperor of Brazil. England asserted by the Aberdeen Act (1845) the right of seizing suspected craft in Brazilian waters. Yet by the connivance of the local administrative authorities 54,000 Africans continued to be annually imported. In 1850 the trade is said to have been decisively put down. The planters and mine proprietors cried out against this as a national calamity. The closing of the traffic made the labour of the slaves more severe, and led to the employment on the plantations of many who before had been engaged in domestic work; but the slavery of Brazil has always been lighter than that of the United States. On 28th September 1871 the Brazilian chambers decreed that slavery should be abolished throughout the empire. Though existing slaves were to remain slaves still, with the exception of those possessed by the Government, who were liberated by the Act, facilities for emancipation were given; and it was provided that all children born of female slaves after the day on which the law passed should be free. They were, however, bound to serve the owners of their mothers for a term of 21 years. A clause was inserted to the effect that a certain sum should be annually set aside from fines to aid each province in emancipating slaves by purchase. Seven years before the passing of this Act the emperor, whose influence has always been exerted in favour of freedom, had liberated his private slaves, and many Brazilians after 1871 followed his example. According to the census of 1835 there were then in

Brazil 2,100,000 slaves It was estimated that at the beginning of 1875 there were not more than 1,476,567 But in 1884 they are spoken of as 3 000,000 in number A gradual separation has been for some time taking place between the parts of the country in which slave labour is used and the free-labour regions Slavery is being concentrated in the districts between Maranhão and São Paulo In 1880 the deputy Joachim Nabuco, leader of the anti-slavery movement, obtained leave to introduce a bill for a more rapid liberation of slaves than was attainable under the law of 1871, and for the final extinction of slavery in Brazil by 1st January 1890 The Government, however, refused to sanction the further progress of the bill, but the question has since become again of present political interest, being the principal subject of discussion in the parliament which opened 1st March 1885 A bill has been passed, known as the Saraiva Law, on which we cannot yet form a definitive judgment, but which is understood to have disappointed the expectations of the abolitionists It is said to provide exorbitant compensation for the slave owners, and, although slaves over 60 years of age are to obtain their freedom, it appears that all slaves, on being set free, as well as the indentured children of slaves, are to remain three years longer with their masters at very low wages, the planters thus practically receiving an additional indemnity

Disguised slave trade

In the colonies of more than one European country, after the prohibition of the slave trade, attempts were made to replace it by a system of importing labourers of the inferior races under contracts for a somewhat lengthened term, and this was in several instances found to degenerate into a sort of legalized slave traffic About 1867 we began to hear of a system of this kind which was in operation between the South Sea Islands and New Caledonia and the white settlements in Fiji It seems to have begun in really voluntary agreements, but for these the unscrupulous greed of the traders soon substituted methods of fraud and violence The natives were decoyed into the labour ships under false pretences, and then detained by force, or they were seized on shore or in their canoes and carried on board The nature of the engagements to go and work on the plantations was not fully explained to them, and they were hired for periods exceeding the legal term The area of this trade was ere long further extended In 1884 attention was drawn in a special degree to the Queensland traffic in Pacific Islanders by the "Hopeful" trials, and a Government commission was appointed to inquire into the methods followed by labour ships in recruiting the natives of New Guinea, the Louisiade Archipelago, and the D'Entrecasteaux group of islands The result of the investigations, during which nearly five hundred witnesses were examined, was the disclosure of a system which in treachery and atrocity was little inferior to the old African slave trade These shameful deeds have made the islanders regard it as a duty to avenge their wrongs on any white men they can entice upon their shores The noble hearted bishop of Melanesia, John Coleridge Patteson, fell a victim to this retaliation on the island of Nukapu 20th September 1871 The tendency of the whole system is to create a war of races It may be questioned whether this trade in labour can be safely continued at all, if so, it must be under a constant and vigorous system of surveillance and regulation

We have seen that the last vestiges of the monstrous anomaly of modern colonial slavery are disappearing from all civilized states and their foreign possessions It now remains to consider the slavery of primitive origin which has existed within recent times, or continues to exist, outside of the Western world

Russian serfdom

In Russia, a country which had not the same historical antecedents with the Western nations, properly so called, and which is in fact more correctly classed as Eastern, whilst slavery had disappeared, serfdom was in force down to our own days The rural population of that country, at the earliest period accessible to our inquiries, consisted of (1) slaves, (2) free agricultural labourers, and (3) peasants proper, who were small farmers or cottiers and members of a commune The sources of slavery were there, as elsewhere, capture in war, voluntary sale by poor freemen of themselves, sale of insolvent debtors, and the action of the law in certain criminal cases In the 18th century we find the distinction between the three classes named above effaced, and all of them merged in the class of serfs, who were the property either of the landed proprietors or of the state They were not even *adscripti glebæ*, though forbidden to migrate, an imperial ukase of 1721 says, "the proprietors sell their peasants and domestic servants, not even in families, but one by one, like cattle" This practice, at first tacitly sanctioned by the Government, which received dues on the sales, was at length formally recognized by several imperial ukases Peter the Great imposed a poll tax on all the members of the rural population, making the proprietors responsible for the tax charged on their serfs, and the "free wandering people" who were not willing to enter the army were required to settle on the land either as members of a commune or as serfs of some proprietor The system of serfdom attained its fullest development in the reign of Catherine II The serfs were bought, sold, and given in presents, sometimes with the land, sometimes without it, sometimes in families and sometimes individually, sale by public auction being alone forbidden, as "unbecoming in a European state" The proprietors could transport without trial their unruly serfs to Siberia or send them to the mines for life, and those who presented complaints against their masters were punished with the knout and condemned to the mines The first symptoms of a reaction appear in the reign of Paul (1796–1801) He issued an ukase that the serfs should not be forced to work for their masters more than three days in each week There were several feeble attempts at further reform, and even abortive projects of emancipation, from the commencement of the present century But no decisive measures were taken before the accession of Alexander II (1855) That emperor, after the Crimean War, created a secret committee composed of the great officers of state, called the chief committee for peasant affairs, to study the subject of serf-emancipation Of this body the grand duke Constantine was an energetic member To accelerate the proceedings of the committee advantage was taken of the following incident In the Lithuanian provinces the relations of the masters and serfs were regulated in the time of Nicholas by what were called inventories The nobles, dissatisfied with these, now sought to have them revised The Government interpreted the application as implying a wish for the abolition of serfdom, and issued a rescript authorizing the formation of committees to prepare definite proposals for a gradual emancipation A circular was soon after sent to the governors and marshals of the nobility all over Russia proper, informing them of this desire of the Lithuanian nobles, and setting out the fundamental principles which should be observed "if the nobles of the provinces should express a similar desire" Public opinion strongly favoured the projected reform, and even the masters who were opposed to it saw that, if the operation became necessary, it would be more safely for their interests intrusted to the nobles than to the bureaucracy Accordingly during the year 1858 a committee was created in nearly every province in which serfdom existed From the schemes prepared by these committees, a general plan had to be elaborated, and the Government appointed a special imperial commission for this purpose The plan was formed, and, in spite of some opposition from the nobles, which was suppressed, it became law, and serfdom was abolished (19th February = 3d March 1861) Its nature and results have been indicated in RUSSIA, vol xxi p 82 The total number of serfs belonging to proprietors at the time of the emancipation was 21,625,609, of whom 20,158,231 were peasant serfs and 1,467,378 domestic serfs This number does not include the state serfs, who formed about one half of the rural population Their position had been better, as a rule, than that of the serfs on private estates, it might indeed, Mr Wallace says, be regarded as "an intermediate position between serfage and freedom" Amongst them were the serfs on the lands formerly belonging to the church, which had been secularized and transformed into state demesnes by Catherine II There were also serfs on the apanages affected to the use of the imperial family, these amounted to nearly three and a half millions Thus by the law of 1861 more than forty millions of serfs were emancipated

Mohammedan slavery

The slavery of the Mohammedan East is usually not the slavery of the field but of the household The slave is a member of the family, and is treated with tenderness and affection The Koran breathes a considerate and kindly spirit towards the class, and encourages manumission The child of a slave girl by her master is born free, and the mother is usually raised to be a free wife But behind this slavery, however mild in itself, stands the slave trade, with its systematic man-hunting, which has been, and still is, the curse of Africa The traffic in slaves has been repeatedly declared by the Ottoman Porte to be illegal throughout its dominions, and there have been several conventions between Great Britain and the khedive for its suppression in Egypt, but it is still largely carried on both in the latter country and in Turkey, owing to the laxity and too often the complicity of the Government officials

Africa

In the days of the colonial slave trade its African centre was the region about the mouths of the rivers Calabar and Bonny, whither the captive negroes were brought from great distances in the interior As many slaves, Clarkson tells us, came annually from this part of the coast as from all the rest of Africa besides At present, it is commonly said,—though Cameron in 1875 was otherwise informed,—no slaves are exported from the western side of the continent The principal centres from which the supply is now furnished to Egypt, Turkey, Arabia, and Persia are three in number (1) The Soudan, south of the Great Sahara, appears to be one vast hunting ground Captives are brought thence to the slave market of Kuka in Bornu, where, after being bought by dealers, they are, to the number of about 10,000 annually, marched over arid desert tracks under a burning sun to Murzuk in Fezzan, from which place they are distributed to the northern and eastern Mediterranean coasts Their sufferings on the route are dreadful, many succumb and are abandoned Rohlfs informs us that "any one who did not know the way" by which the caravans pass "would only have to follow the bones which lie right and left of

the track." Negroes are also brought to Morocco from the Western Soudan and from Timbuktu. The centre of the traffic in Morocco is Sidi Hamed ibn Musa, seven days' journey south of Mogador, where a great yearly fair is held. The slaves are forwarded thence in gangs to different towns, especially to Morocco city, Fez, and Mequinez. About 4000 are thus annually imported, and an *ad valorem* duty is levied by the sultan, which produces about £4800 of annual revenue. The total number of negro slaves in Morocco appears to be about 50,000. (2) The basin of the Nile, extending to the great lakes, is another region infested by the slave trade; the slaves are either smuggled into Egypt or sent by the Red Sea to Turkey. The khedive Ismail in 1869 appointed Sir Samuel Baker to the command of a large force with which he was "to strike a direct blow at the slave trade in its distant nest." The instructions in the firman issued to him were as follows:—"To subdue to our authority the countries situated to the south of Gondokoro, to suppress the slave trade, to introduce a system of regular commerce, to open to navigation the great lakes of the equator, and to establish a chain of military stations and commercial depôts throughout Central Africa." The work energetically commenced by him was continued by Colonel C. G. Gordon (1874 to 1879), but since the revolt of the Soudan, it is to be feared, no trace of his or of Baker's work remains in the scene of their labours. The most effectual direct methods of dealing with the slave trade in the present territories of Egypt seem to be those suggested by the Anti-Slavery Society to Mr Gladstone's Government in 1881—extended consular supervision, and a compulsory registration of all existing slaves. (3) There has long been a slave trade from the Portuguese possessions on the East African coast. The stream of supply came mainly from the southern Nyassa districts by three or four routes to Ibo, Mozambique, Angoche, and Kilimane. Madagascar and the Comoro Islands obtained most of their slaves from the Mozambique coast. It was believed in 1862 that about 19,000 passed every year from the Nyassa regions to Zanzibar, whence large supplies were drawn for the markets of Arabia and Persia up to 1873. The mission of Sir Bartle Frere to the sultan of Zanzibar in 1873 brought about a treaty for the suppression of the slave trade, but it is to be feared that the cessation of the traffic from that port has not extinguished the traffic but has in part only given it a different direction, through Somâli markets. In Madagascar, which had been supplied from the Mozambique coast, the import and sale of slaves were prohibited within the Hova dominions by Queen Ranavalona II. in June 1877. The rulers of the Comoro Islands, Mohilea and Anjuan (or Johanna), have signed treaties for the abolition of the status of slavery in their dominions after 1890, the fulfilment of which, however, it will probably be difficult to enforce. The stations established by the English universities in the valley of the Rovuma and by the Established and Free Churches of Scotland on Lake Nyassa doubtless contributed much to the diminution of the traffic in those parts. It is said that, whereas no less than 10,000 slaves formerly passed the southern end of the Nyassa every year, in 1876 not more than 38 were known to have been conveyed by that route. Lieutenant O'Neill, British consul at Mozambique, writing in 1880, fixed at about 3000 the number then annually exported from the coast between the rivers Rovuma and Zambesi. But since that date the traffic seems to have received a fresh impetus from an increased demand for ivory, the slave and ivory trades being "hand and glove." The Portuguese appear to be the most determined upholders of the evil system, and in consequence are everywhere detested by the natives.

There are other minor branches of the trade elsewhere in Africa. Thus from Harar in Somâli-land caravans are sent to Berbera on the coast, where there is a great annual fair. The slaves are collected from the inland Galla countries, from Gurâgwe, and from Abyssinia.

Clarkson first, and Buxton afterwards, whilst they urged all other means for the suppression or discouragement of the slave trade and slavery, saw clearly that the only thoroughly effectual method would be the development of legitimate commerce in Africa itself. When Buxton published in 1840 his book entitled *The Slave Trade and its Remedy*, this was the remedy he contemplated. The unfortunate Niger expedition of 1841 was directed to similar ends; and it has been more and more felt by all who were interested in the subject that here lies the radical solution of the great problem. It was for some time thought that from Sierra Leone as a centre industry and civilization might be diffused amongst the nations of the continent; and in 1822 the colony (which in 1847 became the independent republic) of Liberia had been founded by Americans with a similar object; but in neither case have these expectations been fulfilled. A new, and it would seem really hopeful, effort for the same great end has recently been undertaken.

Congo Free State. Leopold II., king of the Belgians, invited in September 1876 representative geographers to a conference in his palace, to discuss the question of the exploration and civilization of Africa through the development of commerce and the abolition of the slave trade. Six European nations were represented, and an International African Association was formed. The central committee organized seven successive expeditions from the east coast to Lake Tanganyika. The exploration of the Congo by Stanley turned attention to the west coast, and he went out to the Congo in 1879 as commander-in-chief of the association, to open up that river. The association obtained, by treaties with the native chiefs, the cession of certain territories. The recognition of its flag and its territorial rights by the European Powers has transformed the association into the Congo Free State. A conference was held at Berlin on 15th November 1884, attended by plenipotentiaries from all the European states, to regulate the position of the new state, and one of its declarations was that "these regions shall not be used as markets or routes of transit for the trade in slaves, no matter of what race; each of these powers binds itself to use all the means at its disposal to put an end to this trade and to punish those engaged in it." The territory of the new state was fixed so as to comprise 1,065,200 square miles, with an estimated population of 42,608,000 souls. Stations have been built at points extending for nearly 1500 miles into the centre of Africa.

There are, it cannot be denied, real dangers connected with this great enterprise for the civilization of Africa. Disputes may arise between the powers having interests in the territories of the new state, and, still worse, the natives may be led to take sides in such disputes. That the African population should be sometimes oppressed, or have justice denied them, by European traders or officials is by no means unlikely in the present state of opinion with respect to our duties towards the retarded races. Difficulties, too, may be created by the rivalries and mutual jealousies of the missionaries of the several Western communions. But, whilst foreseeing these possibilities and urging the necessity of guarding, as far as possible, against the evils referred to, we ought not to view in a grudging or suspicious spirit an enterprise which is begun with pure intentions, and will probably do much to right the wrongs and improve the position of a deeply injured portion of our race. The establishment of the state will be no reason for the cessation of any effort which Western Governments can make, by the exercise of influence and by remonstrance, to induce Turkey and Egypt to fulfil their engagements respecting the slave trade. The rulers of those states are well disposed to appropriate the results of more advanced civilization; and we need not despair of the disappearance in Mohammedan communities of slave-holding and its ally polygamy, since those practices are not enjoined, but only tolerated, by a religious code which social progress will inevitably lead its adherents to modify by interpretation.

Bibliography.—On the several branches of the subject of slavery and serfdom fuller information may be obtained from the following works, which have been amongst those used in the preparation of the preceding sketch.

On Ancient Slavery: H. Wallon, *Histoire de l'Esclavage dans l'Antiquité*, 3 vols., 1847, 2d ed. 1879; A. Boeckh, *Public Economy of Athens*, Eng. transl. by G. Cornewall Lewis, 1828, 2d ed. 1842; William Blair, *Inquiry into the State of Slavery among the Romans, from the Earliest Period to the Establishment of the Lombards in Italy*, 1833; Dureau de la Malle, *Économie Politique des Romains*, 2 vols., 1840; M. Troplong, *De l'Influence du Christianisme sur le Droit Civil des Romains*, 2d ed. 1855. On Mediæval Slavery and Serfdom: G. Humbert, article "Colonat" in the *Dictionnaire des Antiquités Grecques et Romaines* of Daremberg and Saglio (now in course of publication); J. Yanoski, *De l'Abolition de l'Esclavage Ancien au Moyen Age et de sa Transformation en Servitude de la Glèbe* (Wallon and Yanoski had jointly composed a memoir to compete for a prize offered by the Academy of Moral and Political Sciences in 1837; Wallon's portion of the memoir became the foundation of his *Histoire de l'Esclavage dans l'Antiquité* above mentioned; Yanoski's part, the expansion of which was prevented by his early death, was posthumously published in 1860; it is no more than a slight sketch); Benjamin Guérard, *Prolégomènes au Polyptyque d'Irminon*, 1844; Fustel de Coulanges, *Histoire des Institutions Politiques de l'ancienne France* (only the first part has been published, 2d ed. 1877), and *Recherches sur quelques Problèmes d'Histoire*, 1885 (the latter work contains the best extant discussion of the whole subject of the *colonatus*, founded throughout on the original texts); Stubbs, *Constitutional History of England*, 3 vols., 1874–78. On the Colonial Slave Trade and Slavery: Washington Irving, *Life and Voyages of Christopher Columbus*, 1828, several times reprinted; Arthur Helps, *Life of Las Casas*, 1868; Bryan Edwards, *History, Civil and Commercial, of the British West Indies*, 1793, 5th ed. in 5 vols. 1819; Thomas Clarkson, *History of the Rise, Progress, and Accomplishment of the Abolition of the African Slave Trade by the British Parliament*, 2 vols., 1808; T. Fowell Buxton, *African Slave Trade*, 2d ed. 1838, and *The Remedy, a Sequel*, 1840; *Memoirs of Sir T. F. Buxton*, edited by his son Charles Buxton, 3d ed. 1849. On North American Slavery: G. M. Stroud, *Laws relating to Slavery in America*, 2d ed. 1856; H. Greeley, *The American Conflict*, 1865; and John E. Cairnes, *The Slave Power, its Character, Career, and Probable Designs*, 1862, 2d ed. 1863. On Brazilian: Fletcher and Kidder, *Brazil and the Brazilians*, 9th ed. 1879. On Russian Serfdom: D. Mackenzie Wallace, *Russia*, 1877. For the existing state of the African slave trade, and of Egyptian and Turkish slavery, the *Ismailia* of Sir S. Baker, the writings of Livingstone, and the biographies of Gordon may be consulted, besides the many documents on these subjects published by the British and Foreign Anti-Slavery Society. There are two volumes by A. Tourmagne, entitled respectively *Histoire de l'Esclavage Ancien et Moderne*, 1880, and *Histoire du Servage Ancien et Moderne*, 1879, which bring together many facts relating to slavery and serfdom, but they are somewhat loose and uncritical; the author, too, repeats himself much, and dwells on many topics scarcely if at all connected with his main themes. The largest and most philosophical views on slavery generally will be found in Hume's *Essay* "On the Populousness of Antient Nations" and in Comte's *Philosophie Positive*, vol. v., and *Politique Positive*, vol. iii. For its economic effects, when it is regarded as an organization of labour, reference may be had to Smith's *Wealth of Nations*, book iii. chap. 2; J. S. Mill's *Political Economy*, book ii. chap. 5; and J. E. Cairnes's *Slave Power*, chap. 2.

SLAVONIA. See CROATIA AND SLAVONIA.

SLAVS

ACCORDING to the tables published by Boudilovich in connexion with the admirable ethnological map of Mirkovich (St Petersburg, 1875), the Slavs may be grouped geographically as follows —

Geographical distribution. I SOUTH EASTERN DIVISION —1 *Russians* —(*a*) The Great Russians (*Velikorousskie*), who occupy the governments round Moscow and extend as far north as Novgorod and Vologda, south to Kieff and Voronezh, east to Penza, Simbirsk, and Vyatka, and west to the Baltic provinces and Poland, they number about 40,000,000 (*b*) The Little Russians (*Malorossiane*), who include the Rousines or Rousniaks in Galicia and the Boiki and Gouzouli in Bukovina, they number 16,370,000 Drawing a straight line from Sandec near Cracow to the Asiatic frontier of Russia, we shall find their language the dominant tongue of Galicia and all the southern parts of Russia till we come to the Caucasus It is also spoken in a strip of territory in the north of Hungary (*c*) The White Russians, inhabiting the western governments, they number 4,000,000

2 *Bulgarians*, including those in Russia, Austria, Roumania, Bulgaria, eastern Roumelia, and those under Turkish government in Macedonia, their total number is 5,123,592

3 *Serbo Croats*, including those of Servia, Montenegro, the southern part of Hungary, and a few in the south of Russia, they are returned as numbering 5,940,539 Here also may be placed the Slovenes, including those in Styria, Carinthia, and Carniola, amounting to 1,287,000

II WESTERN DIVISION —1 *Poles*, divided between Russia, Austria, and Prussia, they number 9,492,162, under this head may be included the Kashoubes near Dantzic, numbering 111,416

2 *Chekhs*[1] and *Moravians*, 4,815,154 in number, here also may be included the Slovaks, numbering 2,223,820

3 *Lusatian Wends* or *Sorbs*, Upper and Lower, partly in Saxony and partly in Prussia The *Upper Wends* number 96,000, the *Lower* 40,000

Total number of Slavs in both divisions 89,499,683

Originally the Slavs were spread over a great part of northern Germany, extending as far as Utrecht, which was anciently called Wiltaburg and was a city of the Wilzen Thus Slavonic was certainly spoken in Pomerania, Mecklenburg, Brandenburg, Saxony, west Bohemia, Lower Austria, the greater part of Upper Austria, north Styria and north Carinthia, a large part of what is now Hungary, and in the localities now occupied by Kiel, Lubeck, Magdeburg, Halle, Leipsic (= Lipsk, the city of lime-trees), Baireuth, Linz, Salzburg, Gratz (= Gradetz, Gorodetz), and Vienna The names of the old Slavonic tribes originally settled in these parts of Germany are given in Schafarik's *Slawische Alterthümer*, to which work the reader desiring further information must be referred They are mentioned frequently in such writers as Helmold, Dietmar, Arnold, Wittekind, and others We hear of a commercial city of importance, which some writers have rather fantastically termed the Slavonic Amsterdam, called Wolin, on an island of the same name, which was known as Winetha to the Germans and as Julin to the Danes Schafarik even wished to see the Slavonic tribe of the Wilzen in English Wiltshire This, however, cannot be accepted, the original name is Wilsætas and that of the town Wiltun, the town on the river Wily It has long been a generally received opinion that the modern Greeks have a large Slavonic admixture This opinion was boldly asserted some years ago by Fallmerayer and has not been upset even by the labours of M Sathas He dwells much upon the form Σθλαβηνοι as distinct from Σκλοβηνοι, but this corruption seems to be owing to some such false analogy as ἐσθλός Miklosich, in his *Etymologisches Worterbuch der slavischen Sprachen* (1886), considers the two forms to be identical In like fashion Procopius connects Serbi with Σπόροι and Constantine Porphyrogenitus turns Svatopluk into Σφενδόπλοκος Mediæval Greece, especially the Peloponnesus, abounded with Slavonic names, which are now being replaced by others drawn from classical sources Kollar and Wolanski wished to find a Slavonic population in Italy, but their opinions are considered the wild dreams of unscientific patriots, though these views found their way into such works as the *Varronianus* of Dr Donaldson Equally unfounded appears to be the belief that a Slavonic element may be traced in Spain and Asia Minor If the Slavs have lost in the west of Europe, they have gained in the east considerably, as Russia has encroached upon the Ugro Finnish tribes of the northern and eastern portions of its empire, and many of these races are now in various stages of Russification

As to the original home of the Slavonic race there are three leading opinions —(1) the Slavs settled in Europe at a period contemporaneous with or shortly after the arrival of the Teutonic and other Indo-European families, (2) they first made their appearance in Europe with the Huns, Avars, and other Asiatic barbarians in the 3d century after Christ, (3) they originated in Europe, as did the so-called Indo-European race altogether This last view has been maintained by Penka[2] and Schrader[3] (see below) Original home of Slavs

The first of these views has been supported by Schafarik He considers that the Slavs left Asia in very early times for the following reasons —(*a*) the fact that the Slavonic languages are more closely connected with European tongues than with those of Asia, even granting the many affinities of Slavonic with Zend or (as has been recently shown by Hubschmann) with Armenian, (*b*) the similarity of the manners and customs of the Slavs to those of the Celts, Germans, and other European populations, (*c*) the occurrence of many mountains, rivers, and towns having Slavonic names which are mentioned long before the Slavs themselves are found in history, (*d*) the fact that the Slavs are always spoken of by the earlier writers in terms which show that these writers considered them to be an ancient European nation, and were struck with the large area over which their populations extended Moreover, the arrival at a comparatively late period of such large hordes would have made a great impression upon the surrounding nations at the time, and this would certainly have found an echo in their historians and chroniclers Schafarik's view

Schafarik believes that the Slavs or Wends (as they were called by their Teutonic neighbours) were settled at a very early period on the southern coast of the Baltic The word "Wend" he connects with a Slavonic (*voda*) and Lithuanian (*wandů*) root meaning "water", thus it would signify the people dwelling about the water He appears to include under the Slavs all people bearing the name Wends, notably the Veneti on the Adriatic Other writers, however, consider that the word was applied generally to any maritime people, and this view appears probable The name also occurs in Switzerland The Wends then, according to Schafarik, were the earliest inhabitants of the Baltic coast, but they were expelled by the Goths in the 4th century B C Nestor makes other tribes of Slavs to have been established at an early period on the Danube and to have been driven thence by the Vlachs, a people whom scholars are inclined to identify with the Latin colonists from whom in a great measure the modern Roumans are descended We find other tribes settled in the neighbourhood of the Carpathians The first historian who relates anything about the Slavs is probably Herodotus, whose account of the north of Europe is very vague Among the Scythian tribes mentioned by him two have been Classical accounts.

[1] This spelling has been adopted as best calculated to show the pronunciation of the name Czech, in the same way as the French write the word *Tcheque*

[2] *Origines Ariacæ*, Vienna, 1883

[3] *Sprachvergleichung und Urgeschichte*, 1883

identified with the Slavs by Schafarik with considerable probability,—the Budini and the Neuri Of the former we are told that they were a large nation and had blue eyes and red hair The description of the country they inhabited corresponds pretty closely to Volhynia and portions of White Russia The Neuri are placed by Schafarik on the river Bug, which flows through Podolia There at the present day we find a river named Nureff, and the surrounding country is called Nurska This opinion is supported by Schrader, who places the original home of the Slavs in Scythia Posche[1] goes so far as to consider the eastern part of Europe—especially that portion of Russia which constitutes the basin of the Pripet, the Beresina, and the Dnieper—as the primary abode of the Indo-European race Dr Kurd von Schlozer interprets Herod iv § 6—the story of Targitaus and his three children—as an allusion to the Slavs The falling of a plough with its yoke from heaven would hardly be a characteristic tale of a nomad people We seem to have an echo of the stories of the peasants Mikoula, Selianinovich, Piast, and Přemysl, all dear to Slavonic legend The view that the ancestors of the Slavs are to be found among the Scythian tribes has been supported in recent times by the Russian author Zabielin[2] He also thinks that their original settlement was in Volhynia and White Russia The specimens of the Scythian language which have come down in Herodotus and elsewhere can certainly best be explained by Indo-European roots The name Slav does not occur in any writer before the time of Jordanes, unless it be in the Σταυανοί of Ptolemy Jordanes says of them—"quorum nomina licet nunc per varias familias et loca mutentur, principaliter tamen Sclavini et Antes" It is probably connected with the root *slovo*, "the word," which is related to the Greek κλύω (Slav *slŭt*, "to be called"), and in a Polabish vocabulary we get the form *slovo* The Slav thus comes to mean "the intelligibly speaking man" in contrast to "the dumb man," *Niemetz*, which in the modern Slavonic languages has come to mean simply "German" Miklosich (*Etym Worterb*) thinks that the termination *-ene* in Slovene shows the word to be derived from the name of a place and rejects the explanation from *slovo* Some Slavonic scholars have sought an explanation of the name in the word *slava*, "glory"

Penka,[3] however, attempts to upset the ordinary etymology According to him the Slavs are non-Aryan and belong rather to the Ugro-Finnish race Their name, he tells us, shows that they were subjected by the Aryans and became their dependants He considers it to be derived from the present participle of the root *klu* ("to hear," Slav *slŭ*), and thus identifies it with "client" The name Wend is used by Tacitus, who speaks of the Peucini, the Venedi, and the Fenni Ptolemy also alludes to the Wendic mountains He tells us that Sarmatia, *i e*, all the territory east of the Vistula and north of Dacia, was inhabited by widely scattered races and that the Wenedæ were established along the whole of the Wendish gulf Jordanes calls them Winidæ The other name, Antes, applied by this historian to the Slavs, which, like the word Wend, they never used themselves, Schafarik connects with a Gothic root Duchinski, Henri Martin, and others have denied to the Russians the right of being called Aryan Penka,[4] as stated before, carries this opinion much further and refuses the appellation to the whole Slavonic family Finding that many of the Slavs have chestnut-coloured curly hair and dark eyes, that the White Russians are blond, that the southern Slavs are darker and have a shorter head than those in the north, he is inclined to see in the Slavs a very mixed race, and quotes Procopius[5] in support of his opinion

The second of the opinions alluded to above has been adopted by Wocel,[6] according to whom the Slavs in the north of Germany on the Elbe, Moldau, Sale, Spree, as also those living south of the Danube, were not living in juxtaposition in the Bronze Age, but wandered into those regions some centuries after the birth of Christ In proof of this assertion he cites many names of objects which are common to the Slavonic languages and yet could not have been known to any people in the Bronze Period,—as, for example, iron (O S *železo*),[7] objects made of iron, as scythe (O S *kosa*), chisel (O S *dlato*), tongs (O S *klěšta*), knife (*nůž*), saw (*pila*), hoe (*motyka*), sword (*meč*), stirrup (*střemen*), spur (*ostruha*), needle (*jehla*), anchor (*kotva*) Common to all the Slavonic languages are the names for gold (*zlato*), silver (*stříbro*), copper (*měd*), tin (*olovo*) All these words must have been formed while the Slavonic people dwelt together in a comparatively narrow space,—according to Wocel between the Baltic, the Vistula, and the Dnieper, otherwise, according to this author, if we suppose that the Lutitzes, Obotrites, Sorbs, and Chekhs were autochthonous, it is difficult to see how they could have had the same names for many objects which did not exist in the Bronze Age, *e g*, iron, as the Slavs on the Dnieper, the Balkans, and the Adriatic had Wocel considers the Slavs to have been a pastoral people who entered Europe through the passes of the Caucasus He compares the agricultural words which all branches of the family have in common, as *ploug*, "plough" (and also *ralo*), *lemesh*, "ploughshare", *zhito*, "corn", *pshenitze*, "wheat", *yechmen*, "barley", *oves*, "oats", *proso*, "millet", *snop*, "sheaf" On the other hand, as Wocel maintains, objects connected with civilization the knowledge of which only dates from the introduction of Christianity have not a common name in the Slavonic languages, such as "paper," "pavement," "steel," "velvet," &c So also there is no common term for "property" or "inheritance," for the simple reason that the Slavs knew nothing of private property,—the land being held in common under the care of the *vladika* or *stareshina*, as in the Servian *zadrugas* at the present day Wocel's view

The condition of the original Slavs has also been investigated from the linguistic point of view by Gregor Krek[8] According to this writer, besides the cereals previously mentioned the Slavs cultivated the rape (*repa*), the pea (*sochivo, grakh*), the lentil (*lenshta*), the bean (*bob*), the poppy (*mak*), hemp (*konop*), the leek (*louk*), &c, corn ground by a hand-mill or water-mill (*zhrnouv, malin*) into meal (*manka*) and baked into bread (*khleb*), honey (*med*)—the collection of which was an important occupation among the Slavs, as we find by the Polish laws—meat (*menso*), milk (*mleko*), and fruit (*ovoshtiye*) formed their food The drinks were *ol* and *vino*[9], beer and wine Krek considers that the minute details of house-building point to a habit of living in fixed residences,—thus the house (*dom*), the stable (*khlev*), the threshing-floor (*goumno*), the court (*dvor*), the village (*ves*) In opposition, however, to this view of Krek we have the opinion of Hehn, who contends that all the words used among the Slavs for stone buildings are borrowed, and seeks to prove that till comparatively

[9] A word which some recent scholars are inclined to think of Armenian origin

recent times they had only huts made of osiers and led a half nomadic life. Certainly municipal institutions are no feature of Slavonic life, and the paucity of large towns in Russia is striking even at the present day. According to Kreck, words are to be found very early which show the development of the nation from the family. Thus the commune (*obshchina*, *rod*) becomes the family (*plemya*) and the family the people (*narod*, *yenzik*). There are common terms for law (*pravo pravda*, "right", *zakon*, "law"). Besides agricultural pursuits we have mention of the arts of braiding (*plesti*), weaving (*tkati*), tailoring in a series of common expressions for portions of apparel, carpentering (*tesati*), working in iron, &c. Of the primitive Slavonic flora we have the oak (*doub*), the lime tree (*lipa*), the acorn (*yavor*), the beech (*bouky*), the willow (*vr'ba*), the birch (*brēza*), the pine (*bor*), as also special kinds of fruit, the apple (*yabl'ko*), the pear (*grousha*), the cherry (*vishnya*), the nut (*orekh*), and the plum (*sliva*).

Other views

Pictet placed the original home of the German and Litu-Slavic races on the northern bank of the Oxus. Thence he thought they came over the extensive plains of Scythia to the Pontus Euxinus.

The doctrine of the European origin of the Aryans appears to be steadily gaining ground. It is supported by Professors Rhys and Sayce of Oxford. The last-named is inclined to see the home of the Indo-European race in "the district in the neighbourhood of the Baltic." Dr Ludwig Wilser[1] makes Sweden and the north German shores the centre of the primitive Aryans, from which the Germanic tribes, Celts, Latins, Greeks, Slavs, Lithuanians, Iranians, and the invaders of India gradually detached themselves, migrating mostly southwards and eastwards.[2]

Leaving now the attempts to determine the primitive home of the Slavs and the date of their immigration into Europe, and also the names which they have in common, whether used by themselves or given by foreigners, we will trace as far as possible the derivation of the chief

Names of the Slavonic peoples

appellations of the Slavonic peoples. (1) *Russians*.—For an analysis of this name see RUSSIA (vol. xxi. p. 87 *sq.*). (2) *Bulgarians*.—By the 3d century we find Slavs settled between the Danube and the Balkans. Immigrations were going on till the middle of the 7th century, as these hordes were driven southwards by new invaders. About 681 the Slavonic settlers fell under the yoke of the Bulgarians, a Ugro-Finnish race, if we accept the views of Schafarik, Drinoff, and others. The origin of the Bulgarians themselves is obscure. Some have made them Tatars. Professor Ilovaiski believes them to have been Slavs. The theory which connects the name "Bulgarian," "Bolgare," with the Volga is now no longer held. Early modifications of the name, such as Burgari, Wurgari, &c., show its analogy with forms like Onoguri, Uturguri, Kutriguri. The elements of the word are *bul* and *gari*. Professor Vambéry attempts to derive the name from the Turkish verb *bulga-mak*, "to revolt", but this seems little better than a guess. We are told that Koubrat, a Bulgarian prince, made himself independent of the Avars, and that on his death his territories were divided among his five sons. The eldest remained in the ancient settlement on the Volga, where the ruins of their former capital, Bolgari, are still to be seen. The third son, Asparoukh, crossed the Dnieper and the Dniester, and settled in a place called Onklus, probably the Old Slavonic *ongl*, "angulus," between the Transylvanian Alps and the Danube.[3] From this place they migrated to the localities which they have since occupied, where they became mixed with the original settlers, to whom they gave their name, just as the German Franks imposed theirs on the Gauls, and a branch of the Slavonians took the Finnish name of their conquerors. (3) *Serbs*.—See SERVIA (vol. xxi. p. 688). The name "Croat" has been already explained under SERVIA (*l. c.*). (4) The *Slovenes* have preserved an old form of the family name, and therefore no explanation is necessary. (5) *Poles*.—The first authentic date of their history is the year 963. Perhaps they are the Bulanes of Ptolemy. See POLAND, vol. xix. p. 285. (6) *Bohemians* or *Chekhs*.—The word "Bohemia"—"home of the Boii," a Celtic tribe—has nothing to do with the Slavs who came into the country about 495, after the Marcomanni, who had dispossessed the Boii. The derivation of the name "Chekh" or Czech has never been satisfactorily traced. Dobrovsky sought to connect it with a word *četi*, signifying "to begin," and thus makes the name imply the original inhabitants. Schafarik, however, does not endorse this etymology. Perwolf[4] connects it with a root *čak*, "to beat," and thus makes the name mean "the warriors." Whatever the word "Chekh" may signify, it occurs, as Schafarik has shown, in other Slavonic countries. (7) *Lusatian Wends* or *Sorbs*.—The word "Lusatia" (German *Lausitz*) is derived from the Slavonic *lug* or *luza*, signifying a low, marshy country.

SLAVONIC LANGUAGES AND LITERATURES

Classification and characteristics of languages

The first to attempt a classification of the Slavonic languages was Dobrovsky,[5] who was followed by Schafarik and Schleicher. These agree in the main, except that Schafarik was so little acquainted with Bulgarian—at that time almost a lost language—that he grouped it with Servian.[6] The following are the characteristics of the two divisions, which we take from Schafarik's account with some trifling omissions:—

	SOUTH-EASTERN	WESTERN
(1)	*raz, razoum*	*roz, rozum*
(2)	*iz, izdati*	*wy, wydati*
(3)	*korabl, zemlia*	*korab, zemia*
(4)	*pravilo, molitisa*	*prawidlo, modliti se*
(5)	*moč, noč*	*moc, noc*
(6)	*zviezda, tzvet*	*hwiezda, gwiazda, kwiet*
(7)	*ago*	*ego, eho*
(8)	*omou, toj*	*emu, ten*

This division, however, has been repeatedly challenged. Schleicher insisted upon the two following as important principles: (1) primitive Slavonic *dj*, *tj* become in all west Slavonic dialects *dz*, *ts* (= *c*); among the Chekhs and Sorbs *dz* becomes at a later period *z*; (2) *d*, *t* before *l*, *n* are preserved in the western dialects, but disappear in the south-eastern. Upon this last canon Johannes Schmidt[7] remarks as follows: "The dentals are preserved in Slovenish, certainly in the western part of its area; thus *modlim* in the Freisingian documents, in the perfect participles, as *predel*, *bodel*, *pletel*, *cretel*, fem. *dla*, *tla*, and in the suffix *dlo*, as *kresadlo*, *motovidlo*, *židlo*. *D* is also preserved in Slovenish before *n*, as *omladnem*, *osladnem*, *zbodnem*, *padnem*, *kradnem*. *T*, on the other hand, appears everywhere to vanish before *n*, as *obernem*, 'I go round.'" He also criticizes two of the principles of difference given by Schafarik. The nom. sing. masc. of pronouns appears in western Slavonic to be increased by *n*, thus Chekh, Polish, Lower Sorb, *ten*; Upper Sorbish, *ton*; Polabish, *to*; this, however, occurs in the Freisingian monuments, the earliest form of Slovenish, as *ton*. This *n* belongs to the stem, and is not a particle which has become fused with it; *ten*, *ton*, original form *t'n*, correspond to the Old Prussian *tans*. The use of the preposition *vi* instead of *iz* is not a criterion; *vi* is as much used in Russian as in west Slavonic, thus *viborni*, "the

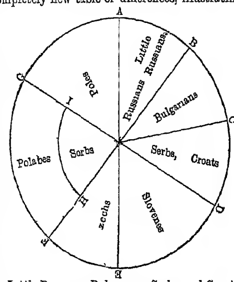
[7] *Zur Geschichte des Indo-Germanischen Vocalismus*, part ii. p. 178, Vienna, 1871-75.

village deputy", there are traces of it in Slovenish; it is only in Bulgarian and Servian that it is entirely wanting. The principle laid down that *moč*, *noč* represent a south eastern variation and *moc*, *noc* a western is far from being universally true; in Servian we have *tsrn*, "black," as against Bohemian *černy*, Russian *chërnï*. Compare too Servian *tsesta*, "a road," also Slovenish, with Chekh *česta*.

Schmidt gives a completely new table of differences, illustrating them by the accompanying diagram.



Casting aside some of the distinguishing marks previously adopted, he makes great use of the phonetic law found in the Slavonic languages which will be explained shortly. The reader will easily identify the divisions of the circle to which the rules refer. (1) *dj*, *tj* become among the western Slavs *dz*, *ts* (=*c*). (2) *d* *t* disappear before *l* and *n* among the Russians, Little Russians, Bulgarians, Serbs, and Croats, but are preserved by the Slovenes, with the exception of *tu*, and by the western Slavs. (3) *vi* is not used by the Bulgarians, Serbs, and Croats, but is kept by the Slovenes, Russians, and western Slavs. (4) (*a*) *ere* by *svarabhakti*[1] became *rě* at an early period among the southern Slavs and Chekhs, but is preserved in its original form among the rest. It became *re* at a later period among the Poles, Polabes, and Sorbs. (*b*) *ele* became *le* not only among the southern Slavs and Chekhs but also among the Polabes. Among the Poles and Sorbs *ele* and the cognate *olo* became simplified into *le* and *lo*. (*c*) *ărå*[2] in *inlaut* became *ra* among the southern Slavs and Chekhs. As in early times the Chekhs and southern Slavs were in close connexion with the Poles and Sorbs, the mutation developed among them; thus Polish *straz* with *stroz*, Upper Sorbish *straža* with *stroža*, Polish and Upper Sorbish, *trapić*. (*d*) *ălå* in *inlaut* became *la* not only among the southern Slavs and Chekhs but also among the Polabes. This contraction spread over a wider region than that of *ărå* into *ra*. That the Polish also adopted it is shown by the form *płazić się* compared with *ptozić sie*.

Litu-Slavic languages. Various opinions have been held as to what languages are to be considered the closest congeners of the Slavonic branch. That they stand in intimate relations to Lithuanian and Lettish has long been agreed; and as a convenient classification it is customary to speak of them together as the Litu Slavic family. In Russia there are 1,900,000 Lithuanians (including the Samogitians or Zhmudes). There are also 1,100,000 Letts. The rest of the Lithuanians, numbering 146,312, are in Eastern Prussia, commencing not far from Konigsberg and extending along the shores of the Kurisches Haff. The Lithuanian language in many respects exhibits an earlier type than the Slavonic. It has preserved the *s* of the nominative singular, as in Sanskrit; but, on the other hand, the verb exhibits a much poorer form. As Leskien truly remarks,[3] "it has degenerated most remarkably in its conjugation, and in this respect is far inferior to the oldest known Slavonic." He adds that Lithuanian is of primary importance in the comparative treatment of the Slavonic languages. Very closely connected with Lithuanian was Old Prussian, which died out in the 16th century; the remains which have come down to us belong to the 15th and 16th centuries. Old Prussian extended from the lower Vistula (from Thorn downwards) to the Niemen. The exact course of the boundary-line which separated it from Lithuanian can only be approximately determined by historical arguments. Leskien has proposed "Baltic" as a generic name for Lithuanian, Lettish, and Prussian. The general opinion of philologists is that Litu Slavic is most closely connected with the Germanic branch of the Indo European family. Jacob Grimm was the first to assert this. Hubschmann has shown that Slavonic has affinities with Armenian, and he seeks to make the latter language a link between the European and Asiatic branches of this family. Kuhn[4] writes, "The Slavonic languages remained a longer time in close connexion with the Indian or more probably with the Zend and Persian than with the remaining Indo European languages." Bopp regards the separation of the Litu-Slavic languages as having taken place before the division of the Asiatic branch of the family into Indian and Iranian.

Old Slavonic. If we examine the Old or Palæo Slavonic,[5] the oldest known form of the Slavonic languages, we may note the following characteristics.[6] It has the vowels *a*, *e*, *i*, *o*, *u*, *î*, a guttural *i*, a short *e* sometimes pronounced as *ya*, and the semi mutes *ĭ* and *ŭ*. It has also two nasals equivalent to the French *in* and *on*, now only found in Polish and Kashoubish, and in some of the Bulgarian dialects; traces of them, however, occur in Slovenish and in the words which Magyar has borrowed from Slovenish.

General characteristics of Slavonic tongues. The Aryan diphthongs have been contracted to single vowels and the hiatus is frequently avoided by the interposition of *j* (= Eng *y*) or *v*, both of which constantly occur at the beginning of words which formerly commenced with a vowel. The addition of a *y* sound before vowels is one of the great characteristics of the Slavonic languages, called "præiotization", and the inability to mark this distinctly is one of the deficiencies of the Cyrillic alphabet. It is also worthy of note that in the provincial dialects *v* is frequently put before vowels, as by the lower classes in Bohemia and Russia. The Aryan aspirates *gh*, *dh*, *bh* have been changed into the simple explosives *g*, *d*, *b*; on the other hand, a number of fricatives have been developed, as *sh*, *z*, and the French *j*—all unknown to the common Aryan—and *k* is frequently changed to the palatal *ch*. Servo Croatian, Slovenish, Slovakish, and Bohemian possess the vocal *r*, while the vocal *l* is found in both Bohemian and Slovakish. The latter has also *l* and *r*, both short and long.

As regards grammar, the following peculiarities of the Slavonic family may be noted. A trace of the article exists in the adjectival termination, as in *velik i*, but this has been forgotten, and attempts have been made to supply it in the use of the demonstrative pronoun in Sorbish, which appears to have been used in the more corrupt stages of Slovenish also, but has been expelled since the regeneration of the language. Primus Truber, who translated the New Testament into Slovenish in the 16th century, was not free from this vice. The languages being in a high state of synthesis, the nouns and adjectives are fully declined, having three genders and seven cases,—the nominative, genitive, dative, accusative, vocative, instrumental, and prepositional. Sorbish and Slovenish have the dual number in both nouns and verbs. More of the numerals are declined than in most Aryan languages. The verbs have the so-called aspects, *e g*, the iterative, perfect, imperfect, &c, whereby very delicate shades of meaning are expressed, and this partly atones for the poverty of tenses in some of them. Russian, for example, has only one past tense, which is inflected according to gender, having been originally a past participle. Traces of these verbal aspects have been detected in Celtic and in Greek.

We now proceed to classify the Slavonic languages according to their dialects. The following table has been adapted (in the main) from the valuable Russian *History of Slavonic Literatures* by Pipin and Spasovich.

SOUTH-EASTERN BRANCH.—*Russian*.—(1) Great Russian Moscow, Novgorod and northern, Siberian, and central Russian. (2) Little Russian eastern, western (sometimes called Red Russian), and Carpathian. (3) White Russian. *Bulgarian*.—(1) Old Bulgarian (the ecclesiastical language, see below). (2) Modern Bulgarian Upper Mœsian, Lower Mœsian, and Macedonian. *Servo Croatian* and *Slovenish*.—(1) Servo-Croatian southern or Herzegovinian, Syrmian, Resanian, and language of the coast or Dalmatian. (2) Slovenish dialects of Upper, Middle, and Lower Carniola, Styrian, Ugro Slovenish, Resanian, and Croato-Slovenish.

WESTERN BRANCH.—(1) Polish Masovian or Mazurian, Great Polish, Silesian, and Kashoubish. (2) Bohemian Chekish, Moravian, and Slovakish. (3) Lusatian Wendish or Sorbish Upper Lusatian and Lower Lusatian. (4) Polabish (extinct).

South-Eastern Branch.

Russian. *Russian Dialects*.—These as yet have rarely been scientifically treated; but that can hardly be a ground of complaint against the Russian people, as our own are only just beginning to be properly studied. The work entitled *Opït Oblastnago Velikorousskago Slovar a* (Attempt at a Provincial Dictionary of the Great Russian Language), published at St Petersburg in 1852, can, as its name implies, only be regarded as tentative. it is no more a scientific production than is Halliwell's *Provincial Dictionary of English*. Traces of Ugro-Finnish words and idioms occur in the northern and eastern dialects, but their importance has been much exaggerated. Whitney's theory that the Russian verb has been modified by Ugro Finnish influence claims attention. Some have supposed that the origin of the *svarabhakti* is to be traced to it; it occurs, however, in Little Russian and the western languages, as previously shown. It is much more frequent in Russian than in any other Slavonic language, and is even more developed in its dialects.[7] An account

[1] This is the name given by the Indian grammarians to the vowel developed between the liquids *l* and *r* and the consonant with which they come into contact, as *vlas*, *volos*. It has been called in Russian *polnoglasie*, and in Greek ἀνάπτυξις. It means in Sanskrit "voice breaking." It is a marked feature in the Slavonic languages.

[2] This is the way adopted by Schmidt to express the unaccented Slavonic *o*, which is pronounced *a*; the form is taken from Swedish.

[7] The quaint little English Russian vocabulary compiled by Richard James in Russia at the beginning of the 16th century, and still preserved in manu

of Russian literature is given under RUSSIA, vol. xxi. p. 102 *sq.* Siberian Russian is spoken by the descendants of prisoners and convicts who have settled in that vast tract of northern Asia since Yermak conquered it for Ivan the Terrible. Specimens of it are occasionally quoted in the letters of Kuchelbecker, the Decabrist, and other exiles. Little Russian is spoken in all the southern governments of Russia. As current in Galicia and Bukovina it is called Red Russian; an interesting variety is the Gouzoulian dialect in which Fedkovich composed his poems (see RUSSIA, vol. xxi. p. 110). Mention has already been made of the same language as spoken in Hungary.[1] There is a good grammar by Osadtza, a pupil of Miklosich. The latter justly regards it as a language and not a dialect. Till quite recently there were very poor aids by way of lexicons: of the *Deutsch-Ruthenisches Handwörterbuch* by Professor Partitzki of Lemberg the Ruthenish German portion never appeared; the vocabularies of Piskunoff and Verkhratzki are but fragmentary. A good dictionary, however, is now in course of publication by Professor Zelechowski of Stanislau, which promises to be all that could be desired. The orthography of Malo or Little Russian is not yet settled. A peculiar type is used for some of the books issued at Lemberg, especially the excellent *Chitanka* (Reading Book) of Alexander Barvinski. An altogether whimsical orthography was adopted by Hatzouk in his *Oukhinok Ridnogo Pola* (Gleanings from a Native Field), which appeared at Moscow in 1857.

The following are some of the chief characteristics which mark off the Little from the Great Russian language. The G. R. *ie* passes into *i*, as *povist*=*poviest*, L. R. *richka*=G. R. *riechka*; *o* undergoes the same mutation, especially in monosyllables, L. R. *pid*=G. R. *pod*, L. R. *kin*=G. R. *kon*, L. R. *vivsa*=G. R. *ovsa*, where we may note the tendency to put *v* before the initial vowel already alluded to. The Russian *ou* is changed into L. R. *v*, and *vice versa*, thus *vmirayou*=G. R. *oumirayou*; *ouchora*, on the other hand, is G. R. *vchera*. The Russian *g* is pronounced *h*; the strong *ł* (Polish *ł*) is changed (especially at the end of a word or before other consonants) into *v* or *ou*, thus G. R. *pisal*, L. R. *pisaou*. The Russian *ě* is wanting, and L. R. changes the Old Slavonic *k* and *g* into *ch* and French *j* oftener than Russian does. In the conjugations and declensions Little very much resembles Great Russian. It has, however, like Polish, lost the present participle passive, which is retained in Russian, and it possesses infinitive forms with diminutive meanings. Moreover, the accent differs considerably from Russian. The peculiarities of the Little Russian spoken in the north of Hungary are fully treated by De Vollant in his *Ougro Rousskia Narodnia Piesni* (Ugro-Russian Popular Songs), St Petersburg, 1885.

White Russian abounds with Polonisms, and in its orthography expresses the unaccented Russian *o* as *a*, which is in accordance with the pronunciation; thus we have *starana* for *storona*, *kago* for *kogo*. As in Malo Russian, *g* is pronounced *h*, as *aharod*, "a garden"; gutturals are softened before *ie*, as *na routzie*, "on the hand." The collection of poems published at Vilna in 1844, entitled *Piosnki Wie'sniacze* (Rustic Songs), in what is called the Kievichian dialect, is in reality White Russian. There is a good White Russian dictionary by Nosovich.

Bulgarian. *Bulgarian.*—Connected with the Bulgarian division is the difficult question as to which of the Slavonic languages, ancient or modern, exhibits the earliest form. The original tongue is, of course, lost, and only an elder sister remains, but to which language shall that title be assigned? In the early days of Slavonic philology many curious ideas prevailed on this point. According to the old-fashioned views the church language was the old and stately mother-tongue from which all the living dialects had sprung. Russians considered it to be Old Russian, Serbs Old Servian, and those who used the Glagolitic ritual held it to be Old Croatian. These opinions were very natural. The fragments of the Old Slovenish language had not yet been found at Freising, and the only accessible manuscripts in the infantine state of the study of Slavistic were recent ones, in which Russian, Servian, and Croatian forms were mixed. The Russians had forgotten many of their historical traditions during their long servitude under the Mongols, and the same was the case with the Serbs and Bulgarians under the yoke of the Turks. The names of Cyril and Methodius were hardly remembered. The two precursors of Dobrovsky, but of inferior intellectual calibre, were the Bohemian Fort Durich (1738-1802), who was the first to have sound views on the relations of Old Slavonic to the later languages, and the Russian Kalaidovich (1792-1832), who threw considerable light on the question by his edition of the works of John, the exarch of Bulgaria. He, however, considered the Palæo Slavonic to be Old Moravian. But the foundation of Slavonic scholarship was laid by Dobrovsky (1753-1829) and Vostokoff (1781-1864), the former treated the subject scientifically in his *Institutiones Linguæ Slavicæ Dialecti Veteris* (Vienna, 1822), and the latter edited the *Ostromir Codex*, a Palæo Slavonic manuscript of the Gospels, written in Russia in the 11th century. Dobrovsky at first considered Palæo-

Mother tongue of Slavonic languages.

script in the Bodleian, gives some interesting examples; thus for modern Russian *sram*, "shame," he gives *sorom*, &c.

[1] An excellent map of this district is given in the *Slavianski Sbornik* (Slavonic Miscellany), vol. ii.

Slavonic to be Old Servian, afterwards an early language out of which both Servian and Bulgarian were formed. Vostokoff was nearer the truth when he discovered elements of Old Slovenish.

The views held by scholars with regard to the country from which the Palæo Slavonic, as preserved to us, has come may be briefly stated as follows. (1) It is Old Bulgarian. This opinion has been held by Schleicher, Schafarik, J. Schmidt, and Leskien. In the latter part of his life Schafarik[2] appears to have somewhat modified his views and to have looked upon it as a mixture of Bulgarian and Slovenish. (2) It is Old Slovenish, *i.e.*, the older form of the language now spoken in Styria, Carinthia, and a part of southern Hungary. This opinion was first held by Kopitar and afterwards by his pupil Miklosich. Among its supporters may also be mentioned Danichich and Jagic. (3) Geitler,[3] now a professor at Agram, leans to the theory that the Russian language is a much earlier form of Slavonic than Old Slovenish. The case for Old Slovenish is clearly put by Miklosich[4] as follows:—

"So far as the linguistic grounds of the Bulgarian hypothesis are concerned, it is undoubtedly true that Old Slovenish [Palæo Slavonic] agrees with a dialect of Bulgarian with regard to the combinations *st*, *zd*, whereas the Carinthian (Carantanian) Slovenish employs generally *č* and *j*; but how do we know that the Pannonian Slovenes pronounced *č* and not *šd*, *j* and not *žd*? The Hungarian *mostoha* (pr. *moshtoha*), *pest* (pr. *pesht*), and *palast* (*palosht*) for the Old Slovenish *mašteha*, *pešt*, and *plašt*, and *rozsda* (pr. *rozhda*) for the Old Slovenish *ržda*, postulate the existence of *št* and *žd* in the dialect of the Pannonian Slovenes. The nasalized syllables (to express the Old Slavonic nasals) in (modern) Slovenish and in the oldest loan words in Magyar from Slavonic separate the language from which these words are borrowed from Bulgarian.[5] Let us also consider the following fact. Modern Bulgarian is more unlike Palæo Slavonic than any other language of the eastern branch. Perhaps it may be observed with reference to this that these corruptions have only crept in during the last centuries. But the language of the *Tale of the Trojan War* (of date 1350) is already Bulgarian, and, whatever may be said to the contrary, Modern Bulgarian. In the same stage of vocalic corruption is the Gospel of Tirnov (Tirnova), which belongs to the year 1273. And does not the same remark hold good of the Psalter of Bologna, of the date 1186-1196? A Bulgarian language identical with Palæo Slavonic fades from our eyes like a *fata morgana* however far we follow it."

The same author considers that even before the 9th century the Slavonic languages were separated as they are to-day. The most able exponent of the Old Bulgarian theory, Schleicher, writes as follows:—

"The proofs which Kopitar and Miklosich have brought forward in support of their opinion appear capable of being overthrown, while facts speak irresistibly for the opposite opinion that church Slavonic was the language of the Old Bulgarians, especially the softening of original Aryan *t* and *d* into *sht* and *zhd*. And besides linguistic there are also historical grounds. Cyril and his Slavonic fellow workers were Bulgarians.[6] Why, then, should they not have written in their own language, especially since they found no written language among the other Slavs?"

Schleicher asks, "How came the Bulgarisms in the *Codex Suprasliensis* [see below], which, according to the opinion of Miklosich, was written 'in ipsa linguæ palæoslovenicæ patria'?" He sums up: "We therefore hold the language which we regard in this work[7] as alone the oldest to be Old Bulgarian." Schleicher appears to the present writer to have the best of the argument.

Modern Bulgarian. Modern Bulgaria embraces ancient Mœsia, Thrace, and Macedonia; the Danube separates it from Roumania; on the west it has Bulgarian, on the south-west Albanian, and on the south Greek, which begins to prevail from a line drawn from Salonica to Constantinople. Its area is dotted by Turkish colonies—the Turks, however, are now fast emigrating—and there is a considerable admixture of Greeks. Modern Bulgarian is a very corrupt form of Slavonic. The vocabulary, to begin with, is full of Turkish words. The wonder is that the language did not altogether disappear. It uses the Slavonic demonstrative pronoun as an article, which is placed at the end of words, as in Rouman, Albanian, and the Scandinavian languages. The cases are very defective, and are mostly expressed by prepositions. There is no regular form of the infinitive, for which a periphrasis is used. The language has only been resuscitated of late years. An American missionary named Riggs published a sketch of the grammar and a short vocabulary. In 1852 the brothers Tzankoff compiled a grammar in which Latin letters were employed. There are other grammars in Bulgarian by Momchiloff and Grouyeff. A dictionary (Bulgarian-French) has since been published by Bogoroff, and there are indications that the language will be scientifically treated, to judge by some excellent papers in the *Archiv für slavische Philologie*. From these we learn that in the Bulgarian dialects the nouns are much more fully inflected, and traces of nasals are found. The Upper Mœsian dialect is also called the *Shopsko narechie* or dialect of the Shopi. Jireček says that these Shopi differ very much in language, dress, and habits from the other Bulgarians, who regard them as simple folk. Their name he connects with the old Thracian tribe of the Sapæi. Those Bulgarians who have embraced Islam are called Pomaks,—a word of which no satisfactory derivation has been given.

[4] *Altslovenische Formenlehre in Paradigmen*, Vienna, 1874.

[5] But, as previously stated, nasals have been found in Bulgarian dialects.

[6] This is rather strongly stated. They are said to have been of Greek origin, but had probably become thoroughly Bulgarized; yet the argument used by Schleicher remains quite as strong, for they would use the form of Slavonic with which they were familiar.

Bulgarian literature. As for the sake of convenience we group Palæo-Slavonic under Old Bulgarian, we shall divide Bulgarian itself into Old and New. (1) *Old Bulgarian.*—We have space here only to mention some of the more remarkable codices. (*a*) *Codex Assemani* in the Vatican, edited by Rački, perhaps belonging to the 11th century, contains extracts from the Gospels for each day of the year. (*b*) *Codex Glozianus*, so called because it once belonged to Count Cloz of Trent, contains homilies by Chrysostom, Athanasius, and Epiphanius, supposed to be of the 11th century. (*c*) *Codex Marianus*, found by Grigorovich in a monastery on Mount Athos, edited by Jagić, of the 11th century. (*d*) *Codex Zographensis*, also edited by Jagić, assigned to the 12th century. These are the chief Glagolitic[1] manuscripts. One of the oldest Cyrillic[2] manuscripts is (*a*) the *Ostromir Codex* (see RUSSIA, vol. xxi. p. 103). It is of the 11th century and was written by the *diak* or deacon Gregory for Ostromir, the *posadnik* or governor of Novgorod. Other Cyrillic documents are (*b*) certain legends and homilies which originally belonged to the monks of the abbey of Suprasl near Bialystok in Poland. They have been edited by Miklosich. The half Cyrillic and half Glagolitic manuscript called the *Texte du Sacre* must not be forgotten, because on it the French kings were accustomed to take the oath at their coronation at Rheims; part of it is of the 14th century. There are also many translations from the Byzantine writers in Old Bulgarian, as from John Malalas, George Hamartolus, and others. (2) *Modern Bulgarian.*—The Bulgarians have some fine collections of popular songs. We can only allude here to the most celebrated. (*a*) The edition of the brothers Miladinoff published at Agram in 1861,—a very interesting collection, with notes on Bulgarian proverbs and customs; these unfortunate men were murdered in a Turkish prison. (*b*) The popular songs of the Macedonian Bulgarians collected by Verkovich; of this only one volume appeared, now very scarce. Verkovich has since published a work entitled *Veda Slovena*, in which he professes to have discovered Old Bulgarian ballads relating to Orpheus; but the production is regarded by most critics as an imposture. (*c*) The collection published in 1875 by Auguste Dozon, containing many interesting ballads. (*d*) The Bulgarian Popular Miscellany (*Bulgarski Narodni Slovnik*) of Basil Cholakoff, published in 1873. The rise of Modern Bulgarian literature is altogether recent. The father of it was the monk Paisi, who lived towards the end of the 18th century. He wrote a book on the history of Bulgaria in Bulgarian, which may be compared to the similar one of Raich in Servian. One of his pupils was Sophronius, bishop of Vracha (Vratza), who wrote his own life and adventures (1804). A translation of the New Testament was published by Sapernoff in 1821. George Venelin (1802-1834), a Little Russian from the neighbourhood of the Carpathians, travelled in Bulgaria in search of manuscripts and had some remarkable adventures there, which are related in the account of him by Bezsonoff; he may be said to have revealed the existence of Bulgaria to the west. Among other writers may be mentioned Rakovski, the author of some eccentric works, but a true patriot, and Slaveikoff. Vazoff is a living poet of some reputation. The Bulgarian Literary Society has now been removed from Braila to Sofia, where it issues its journal (*Periodichesko Spisanie*).

Servian. *Servo-Croatian and Slovenish.*—Of these languages the southern or Herzegovinian dialect has become the literary language of Servia. It is sometimes called the "shtokavstchina" from its use of the word *shto* for the interrogative "what." The language of the coast or Dalmatian littoral is called "chakavstchina" from the use of *cha* in the same way, and Slovenish "kajkavstchina" from the use of *kaj*. There is practically no difference between the Servian and Croatian dialects, but a quasi-difference has been created between them, much more apparent than real, by the employment of the Latin alphabet by the Croats and of the Cyrillic by the Serbs. The reasons for this divergence being theological, it is probable that it will not soon be put an end to. The Servian language is the softest of all the Slavonic tongues and elides many of the consonants. It is rich in tense forms, having preserved the Old Slavonic aorist. The accent is capricious.[3] The vocabulary has incorporated many Turkish words, but these will probably be gradually eliminated as the nation wakes to greater self consciousness. For an account of Servian literature, see SERVIA, vol. xxi. p. 689.

Slovenish. The Slovenes are sometimes called "Wends" and their language "Windish" or "Wendish," an inconvenient term, as it causes some confusion with the tongue of the Lusatian Wends, of which more will be said shortly. Slovenish begins in Styria just south of Klagenfurt (Celovec). Besides Carinthia and Carniola, it is also the vernacular of a small part of Hungary, being spoken in the corner adjoining the river Mur. It is somewhat tiresome to find the few books printed in this part of the country using Magyar orthography. These Slovenish provinces formed a margravate and have long been attached to the domains of the house of Hapsburg. In 1883 they celebrated the six hundredth anniversary of this union and a handsome volume was published in commemoration of the event. For a time they were seized by Ottocar of Bohemia, but regained by Rudolph I., who divided them among his sons. The theory that Old Slovenish exhibits the oldest known form of Slavonic has already been discussed. The language has preserved a dual both in the noun and the verb and its vocabulary teems with interesting Slavonic forms. The attempt of Ljudevit Gaj to fuse Slovenish and Servo-Croatian and make one great South Slavonic literary language is alluded to in SERVIA (vol. xxi. p. 691). Slovenish exhibits an older form of Slavonic than Servian, just as Slovak is earlier than Bohemian. A good grammar was published by Kopitar at Laibach in 1808. To this is prefixed a valuable essay on the Slavonic languages, which was the first treatment of Slavonic philology in a scientific way; nothing so valuable appeared till the epoch making *Institutiones* of Dobrovsky (1822). Grammars were afterwards published by Metelko and Murko, but these have been far surpassed by that of Šuman, a pupil of Miklosich.[4] The orthography of the language has been much improved and it is to be hoped that some of the Germanisms which now disfigure it will be expelled. The Slovenes must banish from their vocabulary such words as *farba* (farbe), *farar* (pfarrer), and *fritoff* (friedhof).

Slovene literature. The earliest specimens of the literature are the manuscripts from Freising in Bavaria now preserved in the library of Munich. They have been assigned to the 9th or 10th century and are written in Latin letters. From that time we find no more trace of the language till the Reformation, when Truber (in 1557) translated the New Testament into Slovenish. He was obliged, however, to quit his country. In 1584 the whole Bible appeared at Tubingen under the superintendence of Jurij Dalmatin; in 1584 the first Slavonic grammar was published by Bohorič, a schoolmaster of Laibach and pupil of Melanchthon; and in 1592 appeared the first Slovenish dictionary by Megiser.[5] After the Protestant movement had been stopped by Ferdinand II., the country fell into a torpor, as did Bohemia. In this condition it remained during almost the whole of the 18th century,—the only productions of that barren period being a few plays and religious works without merit, and the grammars of Pochlin and Gutsmann. Valentine Vodnik (1758-1819) was a poet of some eminence. He flourished during the existence of the short-lived Illyrian kingdom which had been evoked by Napoleon and was destined to fall to pieces rapidly. About this time he composed his *Ilirija Oživljena* (The Revival of Illyria), but, sympathizing too much with the French, he incurred the wrath of the Austrians when they came back into possession, and was deprived of his posts, dying soon afterwards in poverty. Other writers are Jarnik and Ravnikar. The most celebrated poet was Francis Prešern (1800-1849), whose lyrics enjoy great popularity among his countrymen. The Matica Slovenska (Slovenish Literary Society) issues a journal and publishes useful works. In a recent number there is an interesting article by M. Erjavec, entitled "Fragments from a Traveller's Wallet," where we have lists of words gathered by the author from rural districts inhabited by Slovenes. The Resanian dialect of Slovenish may be said to have been discovered by Professor Baudouin de Courtenay; certainly no one before his time had made any study of it. The Rezani, amounting to about 27,000, live on the north eastern corner of the Italian frontier, in two valleys of the Julian Alps, and are Italian subjects. There is also a work on this dialect by Carlo Podrecca, called *Slavia Italiana*. The Ugro Slovenish dialect although it has not been used much as a literary language, is interesting, because it shows some connexion with Slovakish, and is thus a link between the south eastern and western branches of the Slavonic languages.

Western Branch.

Polish. *Polish.*—The dialect of Great Poland has become the literary language. It is a vigorous tongue, but has incorporated too many German and Latin words. The "macaronic" style of Polish writing which did so much to disfigure the language is discussed in POLAND (vol. xix. p. 301). Polish has preserved the nasals *ą* and *ę*. Its accent is almost invariably on the penultimate. There are excellent grammars by Małecki and Malinowski, and the monuments of Old Polish have been well edited by Nehring and Baudouin de Courtenay. The splendid lexicon of Linde in six large volumes is a monumental work. The Silesian dialect is threatened with rapid extermination by the encroachment of the Germans. It has been treated of by Malinowski.[6] Here also may be mentioned a book by Krynski on the dialect of Zakopan at the foot of the Tatra mountains to the south of Cracow. Under POLAND (vol. xix. p. 299 *sq.*) will be found an account of Polish literature.

[1] The origin of the Glagolitic alphabet still remains a puzzle. It is now considered older than the Cyrillic. According to some, it is a modification of Greek cursive writing. Others connect it with Armenian and Albanian alphabets. But none of these views have found general acceptance. The alphabet is now only used by the Dalmatian Slavs in their liturgical books.

[2] An account of the Cyrillic alphabet is given in vol. i. p. 613 *sq.*

[3] The accent in Russian and Servo Croatian is especially difficult. Professor Grote of St Petersburg has already written with great learning on the subject, and Professor Leskien of Leipsic is now publishing a work, *Untersuchungen uber Quantitat und Betonung in den slawischen Sprachen*, of which the first part on quantity in Servian has already appeared.

[4] *Slovenska Slovnica*, by Spisal J. Šuman, Laibach, 1882.

[5] Others have since appeared by Murko and Janežič. The Slovenish Literary Society is now publishing a dictionary, of which the German Slovenish part has appeared in two stout volumes,—a very valuable work.

[6] *Beitrage zur slavischen Dialectologie, uber die Oppelnsche Mundart in Oberschlesien*, Leipsic, 1873.

The Kashoubish dialect is spoken by about 200,000 persons according to Hilferding (others, however, make the number less) in the neighbourhood of Dantzic. This dialect presents some very interesting variations among others the accent is free and not confined to the penultimate as in Polish, and it has more nasals. Its philology has been treated by Dr Cenova,[1] who has also collected their songs and published a small volume of dialogues and literary miscellanies. The word "Kashoub" appears to be a nickname, their proper appellation being "Slovintzi." Schafarik makes the word signify "goats." The position of Kashoubish in the Slavonic family has formed the subject of controversy. In his *Beiträge zur Slavischen Dialektologie*, Herr Leon Biskupski has written an interesting pamphlet in which he essays to prove that it is only a dialect of Polish. This is in opposition to the opinions of Schleicher and Hilferding, who have connected it with the extinct Polabish. The pamphlet contains curious details on the varieties of Kashoubish: the author tells us that every district has its own local dialect. For Kashoubish and its dialects Prince Lucien Bonaparte proposes the term "Baltic"[2], this appellation, however, would be more appropriate to group together Lithuanian, Lettish, and Old Prussian, and in this way it has been used by Leskien.

(2) *Bohemian* (*Chekh*).—This language has several dialects, some too small to be specified here; they will be found enumerated along with other Slavonic dialects in Erben's work.[3] Connected with the Moravian is the Hanacky. Both the grammar and the lexicography of Chekh have been copiously treated, the latter in the excellent work of Jungmann. Schafarik wrote a grammar of the old language. The vocalization of both *r* and *l* has been previously mentioned; *h* has crept in in many places instead of *g*, but this is not found earlier than the 13th century. The accent is always on the antepenultimate.

Bohemian literature may be divided into the three following periods, in which we follow Tieftrunk in his *History*[4]:—(1) the early period, the productions of which are chiefly of poetry from the beginning of Chekh literature till the Hussite wars (1410); (2) the second period, which shows a great development of prose, but also a great decline in literature generally, extends from the time of Hus to the latter part of the 18th century; (3) from the renaissance of Chekh literature till the present time.

(1) The earliest period of Bohemian civilization was subjected to both Latin-German and Greek Slavonic influences. The Latin alphabet may have been introduced even in heathen times. Rostislaff of Moravia invited to his kingdom Methodius, who was appointed archbishop of the country by the pope. We hear even in the 11th century of a Slavonic school in the Vyšehrad (Wyscherad, Prague) where St Procopius studied, to whom tradition assigned a hand in the transcription of the *Texte du Sacre*, previously alluded to. Professor Jagić has printed an extract from an old service book the language of which shows Chekh influences. He has assigned the book to the 10th century. Some other very early specimens of the language are contained in the so called Glagolitic fragments, *Zlomky Hlaholské*. Two ancient hymns belonging to this orthodox period of the Bohemian Church have come down to us, *Hospodine, pomiluj ny* (Lord, have mercy upon us) and *Svaty Vá'clave, Vevodo České Zeme* (Holy Wenceslaus, Lord of the Bohemian land). In 1817 a fragment called *Libušin Soud* (The Judgment of Libuša) was anonymously forwarded to the newly founded Bohemian museum. The sender was afterwards found to have been one Kovař, the steward of Count Colloredo. Some critics assigned it to the 9th century; according to others it is a forgery. With the limited space at our disposal it would be impossible to discuss the question here. The same year also witnessed the discovery by Hanka of the so called Koniginhof manuscript (*Kralodvorsky Rukopis*), consisting of epic and lyric pieces, the authenticity of which some critics have attempted to bring into doubt. The chief hand in these forgeries is alleged to have been Wenceslaus Hanka (1791-1861), who was for some time head of the museum library and the author of some mediocre verse. The next poem of any importance is the *Alexandreis*, a free Chekh version of the Latin work of Philip Walter ab Insulis, surnamed "De Castellione." The Bohemian version was composed by an unknown author probably between 1240 and 1253. To this time belong many versified lives of saints and legends, such as those of St Procopius and St Catherine. The manuscript of the latter poem has been brought back from Sweden, whither it had been removed during the Thirty Years' War, and is now preserved at Brunn in Moravia. The so-called *Chronicle* of Dalimil, a work of some importance, belongs to the 14th century. It is a tedious production, written in octosyllabics, and extends from the creation of the world till 1314. The author is supposed to have been a Bohemian knight, but there is no ground for believing that his name was Dalimil. The work is inspired by great hatred of the Germans. We have a good deal of tedious moral poetry belonging to the 13th century. More interesting matter can be found in the "Satires on Craftsmen" (*Satyry o Remeslnicich*), and a poem on the Ten Commandments. Most of these pieces are anonymous, but the name of one author is known, Smil of Pardubitz, surnamed "Flaška," a leading Bohemian of his day. But little is known of the events of his life, except that he was killed in a skirmish in 1403. His chief work is the *New Council*, one of the beast epics so much in vogue in the Middle Ages. Others, however, are assigned to him, of which the most original and amusing is the "Dialogue between the Groom and Scholar" (*Podkoni a Žak*). A valuable legal document belonging to this period is the *Book of the Old Lord of Rosenberg*, which is one of the earliest specimens of Bohemian prose. Rosenberg was royal chamberlain from 1318 to 1346 and died the following year. Another legal work of importance is the "Exposition of the Law of the Land of Bohemia" (*Vyklad na Pravo Zeme Česke*), by Andrew of Duba, chief justice of the country. Considerable portions of the Bible were translated into Bohemian during the 13th and 14th centuries. The version was completed at the beginning of the 15th century. Wickliffe says of Anne of Luxemburg, the first wife of Richard II, "Nobilis regina Angliæ, soror Cæsaris, habet evangelium in lingua triplici exaratum, scilicet in lingua Bohemica Teutonica, et Latina." There are two early versions of the Psalter,—the Clementine at the end of the 13th or beginning of the 14th century, and the Wittenberg also at the beginning of the 14th. The doubts which have been thrown on the fragments of the early version of the Gospel of St John appear to be completely dissipated by the well timed work of Dr Jan Gebauer. Dr Adolf Patera has discovered recently another religious poem of this period.[5] Another early prose chronicle deserving of mention is that of Pulkava, a priest, who died in 1380. It extends from the earliest times to the year 1330, and was originally written in Latin, but he afterwards translated it into Chekh. "The Weaver" (*Tkadleček*), called after the name of its author, who lived in the first half of the 14th century, is a curious prose poem, in which the author celebrated the fair Adlička, one of the beauties of the Bohemian court. The piece is full of the usual conceits of the age; it has not yet been ascertained whether it is original or only an adaptation. It very much resembles *Der Ackermann aus Bohmen*, of which four manuscripts have been preserved. Perhaps, as Gebauer has surmised, they are both adaptations of a piece which is now lost. Passing over a quantity of mediæval legends and tales, such as *Flore et Blanchflore*, we need only mention, as dealing with native subjects, the two chronicles of *Stilfrid* and *Bruncvik*, supposed to have been originally written in verse. The most remarkable Bohemian writer of the 14th century is Thomas of Štitny, who writes on ethical and religious subjects. He was born of a noble family about 1330, and probably lived till the close of the century. He appears to have studied at the university of Prague, then newly founded. His chief works are a treatise on *General Christian Matters*, in six books (edited in 1852), and the *Books of Christian Instruction*, printed with an introduction by Vitátko in 1873. His style is easy and flowing. Loserth has rightly said that the object of Štitny was to put in a popular form the sum total of the scholastic knowledge of his age. There is also a Chekh version of the *History of the Trojan War*, composed by Guido di Colonna from Dictys Cretensis and Dares Phrygius; it was one of the first printed in Bohemian, and was issued from the press at Pilsen in 1468.

(2) The second period begins with the great name of Hus, whose Second
Bohemian writings were edited by Erben in 1865-68. Hus de- period,
veloped his native language as Luther did German. He corrected the translation of the Bible, and improved Bohemian orthography. We have nine letters written by him while in prison at Constance. During the period of the Hussite wars there was abundance of political and religious pamphlets. Most of these productions, however, were of ephemeral interest. The travels of Marco Polo and Sir John Mandeville were translated into Bohemian. Peter Chelcicky, one of the leaders of the United Brethren, was a popular writer. He was a cobbler by trade, hence he was nicknamed "Kopyta," or the Shoe-Last. His works, written between 1430 and 1456, have a strongly marked democratic tone; among them may be especially mentioned his *Postils* and the *Net of Faith* (*Sit Viry*). In 1488 the complete Bible was printed in Bohemia, the first regular printing press at Prague having been set up the year before. In 1506 a Calixtine Bible appeared at Venice. The national literature made distinct progress under George Poděbrad, a native king. Vavrinec z Brezové (1370-1455) wrote in Latin *Historia de Bello Hussitico*, of which there is an early Chekh translation. There is a satire in Latin by Jan Hasisteinsky z Lobkovic, entitled *Lament of St Wenceslaus over the Morals of the Chekhs*. He was also a considerable traveller in the East. The Chekhs were fond of making pilgrimages to the Holy Land; Martin Kabatnik was a traveller of this kind. His *Peregrinations* were first printed in 1518. Works on law were written by Ctibor and Viktorin, and many translations from the classics appeared. Gregory Hruby z Jelene (called Gelenius) and his son Sigismund

[5] See *Arch. f. slaw. Phil.*, vol. vii.

were very industrious in this way, the latter published at Basel in 1536 a curious dictionary, *Lexicon Symphonum*, an early attempt at comparative philology, in which he compares Greek, Latin, German, and Slavonic. We must find space for a mention of the writings of Dubravius (c. 1489–1553), bishop of Olmutz, although he used the Latin and not the Bohemian language. His work on fish ponds and fish (*Libellus de Piscinis et Piscium qui in eis aluntur Natura*, 1547) is not altogether unknown to Englishmen owing to the citations in Izaak Walton, with whom the bishop was a great authority. His most important work, however, was his *History of Bohemia* in thirty-three books, from the earliest times to the coronation of Ferdinand I. at Prague in 1527, the termination of Bohemian independence. In 1533 appeared the first Chekh grammar, by Beneš Optat. Verse-writers abounded at this time, but no poet of eminence. Veleslavin (1545–1599) was an indefatigable worker, being, like Caxton, both printer and author. The Latin herbal of Andrew Matthiolus, physician to the archduke Ferdinand, was translated by Thaddeus Hajek. Some good works on law appeared, and there are quantities of sermons. Simon Lomnicky (b. 1560) wrote a great deal of poetry; he was the laureate of Rudolph II., and also wrote a triumphal song for the elector Frederick when chosen king of Bohemia by the Protestants. He was severely wounded at the battle of the White Mountain and spent the rest of his days in poverty; but there appears to be no truth in the story that he became a public beggar. The claims of Lomnicky to be considered a poet are but meagre; he writes little better than rhymed prose. There is some merit, however, in his comic pieces and satires. At this period flourished the chronicler Hajek, who appears to have been a priest, and who died in 1553. His work is interesting, but altogether uncritical, and he does not seem to have cared much about truth. He gives us all the old Chekh sagas, and fortunately uses the Chekh language. His book attained great popularity, and was translated into German. Indeed, it was almost the chief authority for Bohemian history till towards the close of the 18th century. The travels of Christopher Harant in the Holy Land are full of learning and of curious matter. A new edition was published in 1854. The author perished on the scaffold on the memorable 19th June 1621, when Bohemia lay completely at the feet of the Hapsburg conqueror. Harant started for his journey in 1598, he and his companions being dressed as Franciscan friars. There is also the account by Wenceslaus Vratislav of Mitrovitz (1576–1635) of his three years' captivity at Constantinople,—a work full of picturesque incidents. The letters of Karl ze Žerotin (d. 1636), one of the Moravian Brethren, who was for some time in the service of Henry IV. of France, have been edited by Brandl. With the battle of the White Mountain in 1620 terminates what has been called the golden age of Chekh literature. In 1615 the diet had made a resolute effort to protect the national language. But now the country became Germanized, and books in Chekh were eagerly sought out and destroyed. In addition to its sufferings during the Thirty Years' War, Bohemia had the misfortune to lose many of its most valuable manuscripts, which were carried off by the conquerors. For nearly 200 years Bohemia ceased to be counted among the nationalities of Europe. Here and there a patriot laboured in the interest of his country, such as the Jesuit Balbin or Balbinus (1621–1688), who was professor of rhetoric at Prague and author of *Epitome Rerum Bohemicarum* (1677) and also *Miscellanea Rerum Bohemicarum* (1680–81). His services to Bohemian literature were considerable, but his writings are in Latin. Many authors of repute were, however, at this time in exile, and of these no one has earned a greater renown than Jan Amos Komensky (frequently styled by the Latin form of his name, Comenius). This eminent man was born at Nivnitz near Hungarian Brod in Moravia and was the last bishop of the Moravian Brethren. After the battle of the White Mountain he fled to Poland, which at that time had not altogether lost its spirit of toleration. Here he was joined by some Polish dissidents and formed the nucleus of a religious society. In 1631 he published his *Janua Linguarum Reserata*, in which he developed a new theory of learning languages. This work became very popular and has been repeatedly translated. He afterwards visited England and Sweden, and in 1659 gave to the world his *Orbis Pictus*, which also enjoyed great reputation as an educational work. He died at Amsterdam in 1670. It would be impossible in a brief sketch like the present to give a detailed list of the writings of Komensky. Of his Bohemian works we may mention the prose poem *Labyrint Světa a Ray Srdce* (The Labyrinth of the World and Paradise of the Heart) and his *Informatorium Školy Mateřske*. He also translated the Psalms into Chekh. In 1656, on the destruction of the town of Leszno by fire, Komensky lost some of his most valuable works still in manuscript; we may especially regret his *Poklad Jazyka Českého* (Treasury of the Bohemian Language), upon which he had been engaged from 1612. During the latter part of the 17th century and the greater part of the 18th the language and literature of Bohemia steadily declined. A few scribblers appeared, such as Rosa, Pohl, and Šimek, but their names are hardly deserving of mention. But Gelasius Dobner and Martin Pelzel were valuable workers in the field of Bohemian history.

Modern period.

(3) The true study of the Slavonic languages may be said to have begun with Joseph Dobrovsky. In 1809 he published *Ausführliches Lehrgebäude der böhm. Sprache*. In 1822 appeared at Vienna his great work *Institutiones Linguæ Slavicæ Dialecti Veteris*. Dobrovsky died in 1829. The strange thing about him is that, in spite of all his labours, he had no faith in his native language and despaired of its revival. But, like Columbus, he was destined to accomplish greater results than he expected. Joseph Jungmann (1773–1847), another regenerator of the Chekh language, was author of the great dictionary and an esteemed translation of *Paradise Lost*. Besides these works he wrote a history of Bohemian literature. Kollar (1793–1852) and Čelakovsky (1799–1852) both earned a considerable reputation as poets,—the first by a series of sonnets called *Slavy Dcera* (The Daughter of Glory), under which title he celebrates the praises of all Slavonic lands and at the same time his love for the daughter of a German pastor; the second by his "Echo of Russian Songs" (*Ohlas Písni Ruskych*) and the "Rose with a Hundred Leaves" (*Růže Stolistá*). A good poetical style was now formed for the Bohemians, and a host of minor poets appeared for whose names we cannot find space. Karel Erben (1811–1870) has left some excellent ballads in his *Kytice* (Garland). His genius was kindled by the folk tales with which Bohemia abounds. He conferred a benefit upon Slavonic students by his interesting collection of national tales previously alluded to; moreover, he was a sound scholar and an indefatigable antiquary. *Regesta diplomatica necnon epistolaria Bohemiæ et Moraviæ*, extending to 1253, and editions of Harant's *Journey to the Holy Land* and Nestor's *Chronicle* are monuments of his industry. A great impulse to Bohemian poetry was given by the discovery of *Libušin Soud* and of the *Kralodvorsky Rukopis* by Hanka. Vitezslav Halek (1835–1874) has left two volumes of poems, which were reprinted in 1879 under the editorship of Ferdinand Schutz. Halek presents a twofold appearance, first as the writer of a series of narrative pieces of a half dramatic character, reminding us of the *Idyls* of Tennyson, secondly as a lyrical poet. In his "Heirs of the White Mountain" (*Dedicove Bile Hory*) he has chosen a patriotic subject which must find its way to the heart of every Bohemian. He has been fortunate in having some of his poems wedded to the music of Dvořák. Jan Neruda (b. 1834), still living, has written "Flowers of the Churchyard" (*Hřbitovní Kviti*), published in 1858, and a volume of poems called "Cosmic Songs" (*Písne Kosmické*). According to some Bohemian critics the greatest of their modern lyric poets is Adolf Heyduk, born in 1836 and still living at Pisek. Much of his poetry has been inspired by the south of Europe. His "Forest Flowers" (*Lesní Kvítí*) were gathered, as he tells us, while wandering amidst the delightful scenery of the Šumava or Böhmerwald. Heyduk, although a Slovak, has avoided the Slovakish dialect, which has been used by Holly, Sladković, and others. His patriotism is very conspicuous in *Cymbal and Guitar*. One of his most popular works is *Deduv Odkaz* (The Grandfather's Bequest), the grandfather being the genius of the country, who instructs the poet. Some very elegant verses, showing a true feeling for nature with feminine delicacy of expression, have been published by Mademoiselle Henrietta Pech, who writes under the name of "Eliška Krasnohorska." Her first volume was published in 1870 and entitled *Z Maye Žiti* (Life in May). Her "Poetical Pictures" (*Basnické Kresby*) show great power of word-painting. M. Josef Vaclav Sládek (b. 1845), who has published several volumes of original poems, besides translations from English and other languages, shows considerable lyrical power. The most voluminous, however, of the modern writers is Emil Bohus Frida (b. 1853), who uses the pseudonym of "Jaroslav Vrchlicky." He has been astonishingly active; among his principal productions may be mentioned the following,—*Mythy* (Myths), which he divides into two cycles; the miscellaneous collection "From the Depths" (*Z Hlubin*), which is inscribed to Vitezslav Halek, and seems to be inspired by the same scenery as kindled Halek's fancy; *Duch a Svet* (The Spirit and the World), fine lyrics, the motive of which has been supplied by Greek mythology. He has subsequently published *Dojmy a Rozmary* (Impressions and Fancies), and, besides other translations from various languages, a version of the *Divina Commedia* in the *terza rima* of the original. He is also the author of some plays which are much esteemed, especially *Drahomíra*. Dr J. Durdík, J. J. Kolár, and L. Stroupežnicky have attained celebrity in this branch of literature. Some good poetry has been written by Svatopluk Čech. Some critics rank him as the greatest poet of the modern school since the death of Halek. In addition to poetry he has also published three volumes of tales (*Povídky, Arabesky, a Humoresky*), collected by him from his various contributions to magazines. Many of these show considerable humour. Another poet by no means to be passed over in this brief sketch (which only attempts to grasp the salient facts with regard to these authors) is M. Zeyer, who has published a series of epic pieces, called *Vyšehrad*, after the well-known Chekh stronghold or acropolis at Prague. The subjects are all taken from the Old Bohemian legends on Libuša, Vlasta, Lumír, &c. Zeyer has adopted the Slavonic metre as we find it in the Servian songs collected by Vuk Stephanovich. Besides these poems

he has written a good historical novel entitled *Andrew Chernisheff*, which deals with the reign of Catherine II of Russia In 1880 appeared two other tales by the same writer, *Romance concerning the Faithful Friendship of Amisa and Amil*, and a strange book of Oriental tales styled *Baje Šošany* (Stories of Susannah) As with us, the social romance or novel of domestic life has latterly been much cultivated among the Chekhs The legends and tales current among the peasantry have also been carefully collected, first by Božena Nemcova (1820-1862), whose *Slovenske Povesti* had a very great success She was followed by Madame Mužak, authoress of some of the most popular of the modern Bohemian novels Her "Country Romance" (*Vesnicky Roman*) has been translated into French Excellent pictures of rural life have also been given by Vaclaff Smilovsky (a *nom de plume* of Smilauer), who has written a great many novels, as the "Old Organist" (*Stary Varhanik*), *Martin Oliva*, &c, much in the style of Auerbach and Zschokke Other writers of historical novels are M Bohumil Cidlinsky and Vaclaff Vlček Madame Zofie Podlipska, sister of Madame Mužak, is known as a popular writer of social romances For an account of the historical labours of Francis Palacky, see PALACKY Among the pupils of the great historian the first place must be given to Vaclaff Vladivoj Tomek (b 1818), now professor of Austrian history in the university of Prague, whose chief production is a history of that city, which he has carried to a fifth volume In 1849 he published the first volume of a history of the university of Prague, which seems never to have been completed, and in 1880 a biography of the Bohemian hero Žižka He appears throughout as a most accurate and painstaking writer Vocel (1803-1871) is the author of a valuable work, "The Early Days of Bohemia" (*Pravěk Země Ceske*), which we have quoted already when treating of Slavonic ethnology Alois Šembera (1807-1882), whose literary activity extended over a long period, wrote voluminously on Bohemian history and literature He was professor of the Bohemian language at the university of Vienna In a work on the western Slavs (*O Zapadnich Slovanech*) he maintained that the Chekhs, Moravians, Slovaks, and Polabes were settled much earlier in the countries which they at present occupy than many historians have been willing to admit As a critic, Professor Šembera is an iconoclast and has attacked many of the (supposed) early monuments of the Chekh language Dr Antonine Gindely, born at Prague in 1829, has proved himself to be a most conscientious and enthusiastic worker in the field of historical research In order to collect materials for his publications he travelled in various parts of Bohemia, Poland, Germany, France, Belgium, Holland, and Spain The results of this diligence have appeared in a collection of valuable historical works, such as the *History of the Bohemian Brethren*, *Rudolph II and his Times*, and later a *History of the Bohemian Revolt of 1618* The brothers Joseph and Hermenegild Jireček have won a reputation in Bohemian literature by many useful works They have conjointly published a book in defence of the *Kralodvorsky Rukopis* which is well worthy the attention of those who wish to make themselves acquainted with the literature of this vexed question Joseph is now occupied in editing in a cheap form some of the most interesting monuments of early Bohemian literature In 1880 Hermenegild published a valuable *Collection of Slavonic Laws*, containing an almost complete series of the early codes of the Slavs in the original languages Joseph Jireček is also author of a useful chrestomathy of Bohemian literature with biographical and critical notices Joseph Constantine Jireček (son of Joseph, born in 1854), formerly a *privatdocent* of the university of Prague, has devoted himself to Bulgarian history and bibliography In 1872 he published a *Bibliography of Modern Bulgarian Literature*, and has written a *History of Bulgaria*, of which a German translation has appeared Joseph Emler and Karl Tieftrunk have been co-operators with Dr Gindely in his "Old Monuments of Bohemian History" (*Stare Pamatı Dejin Českych*) The former has also edited the second volume of the *Regesta Bohemica* and since 1870 has been editor of the "Journal" (*Časopis*) of the Bohemian museum Karl Tieftrunk has written several useful works, among them the *History of Bohemian Literature* from the earliest period to the present time, and the interesting monograph on the opposition of the Bohemian states to Ferdinand I in 1547 The *History of Bohemian Literature* is very carefully written and gives in a short compass much valuable information An elaborate work is now appearing in parts by F Backovsky, entitled *Zevrubne Dejiny Českého Pisemnictví Doby Nové* (A Complete History of Modern Bohemian Literature) from the year 1774 to the present time There is also a work by Jerábek, *Early Days of Romantic Poetry* Many valuable contributions to Bohemian history have proceeded from the pen of Dr Joseph Kalousek (b 1838) Vincent Brandl and Beda Dudik have devoted particular attention to Moravian history and antiquities The former, among other works, has edited the letters of Karl ze Žerotin, previously mentioned Beda Dudik, a Benedictine monk and historiographer of Moravia, has published some valuable works on the history of that portion of the Bohemian kingdom and has also written a *History of Moravia* Like the great work of Palacky, it was first written in German, but has since appeared in the Bohemian language Extracts from the interesting diary of Žerotin have been edited by him in the *Mahrische Geschichtsquellen* Through his efforts twenty-one Bohemian manuscripts which had been carried away to Sweden at the time of the Thirty Years' War have been restored, and are now preserved in the state archives of Brunn Among these is the *Legend of St Catherine*, many words in which are said to explain difficult passages in the *Kralodvorsky Rukopis* and to furnish testimony to its authenticity Jakub Maly (d 1885) was the author of many important articles in the *Slovnik Naučny*, the Chekh *Conversations-Lexicon*, and of a popular history of the Bohemian people He also wrote a grammar of Chekh for Englishmen, besides assisting in the translation of Shakespeare, which has been produced by the joint labours of many Bohemian scholars In 1868 was published under the editorship of Erben the second volume of the *Vybor z Literatury České*, a very important work, containing specimens of the old Bohemian authors The first volume had been edited by Schafarik, for an account of whose literary activity see SCHAFARIK Valuable works on philology have been written by Martin Hattala, by birth a Slovak, who is now professor of Slavonic philology at the university of Prague One of his most important productions is in Latin, *De Contiguarum Consonantium Imitatione in Linguis Slavicis* He is a defender of the genuineness of the two celebrated manuscripts, the Zelenohorsky (*i e*, "that which contains the judgment of Libuša") and the Kralodvorsky Among sound philologists are reckoned Drs Gebauer and Gertler The former has contributed some valuable papers to the *Archiv fur slawische Philologie*, edited by Professor Jagić of St Petersburg The latter, born in 1847, is at present professor of Slavonic philology at the university of Agram He commenced his studies at Prague under Alfred Ludwig, the translator of the *Vedas*, and Hattala, and at Vienna under Miklosich Having begun with a dissertation in the *Časopis* on the present condition of comparative philology, he published in the same year a work on the Old Bulgarian language In 1873 he made a tour in Russian and Prussian Lithuania, that, like Schleicher, he might study that interesting language from the mouths of the people He afterwards published the results of his travels in his *Lithauische Studien* He has since written a treatise on the Albanian alphabet (*Die Albanesischen und Slavischen Schriften*, Vienna, 1883) In this an attempt is made to connect the Glagolitic and Albanian alphabets A valuable work was written by Antonin Matzenauer (b 1823), entitled "Foreign Words in Slavonic Languages" (*Cizi Slova ve Slovanskych Rečech*) Excellent works on classical philology have been published by A Kvičala and Vaniček Natural science was successfully cultivated by Jan Svatopluk Presl (1791 1849), professor in the university of Prague, and Jan Ev Purkyne (1787-1869), professor of physiology in the same university As regards moral philosophy, the first part of Dr J Durdik's *History of Recent Philosophy* has just appeared, which extends from Kant to Herbart Throughout the whole period of the resuscitation of Bohemian literature the society called the Matice Česka has worked energetically, printing its excellent journal or *Časopis* four times a year, and also issuing some of the old Bohemian classic and meritorious works by modern authors It was a great triumph for the Chekhs when a part of the instruction of the university was allowed to be carried on in the Bohemian language A new magazine (*Slovansky Sbornik*) made its appearance at the beginning of 1884 The *Listy Philologické* (Philological Leaves) is still published Recently a new literary journal (*The Athenæum*) has been started, which seems to be more or less modelled upon its English namesake

Slovak —This language or dialect is spoken in the north-western corner of the kingdom of Hungary It is generally considered to exhibit an earlier form of Chekh, and this is proved by many of its grammatical peculiarities being found in the older Chekh literature One characteristic of the language is the use of diphthongs in cases where the other Slavonic tongues use simple vowels For a long time the Slovaks employed Chekh in all their published writings About the close of the 18th century a separatist movement began The first Slovak grammar was published by Bernolak at Presburg in 1790 It was followed by those of Dranška and Viktorin There is a Slovak dictionary by Loos The attempt to form a new literary language was to be deplored on many grounds, for both the Magyar and the German have to be resisted For a short time a literary society existed among the Slovaks, which published useful books and a journal The Magyars, however, suppressed it, because it was "contra integritatem patriæ," as we were told by one of their ecclesiastics The Bohemian naturally resents the attempts at separation by the Slovak, and in 1846 the Chekh Literary Society issued a work entitled "Opinions in Favour of One Written Language for the Chekhs, Moravians, and Slovaks" (*Hlasove o potřebě Jednoty Spisovného Jazyka pro Čechy, Moravany, a Slovaky*) The Slovaks have produced a few poets of repute, such as Holly, Sladković, and Chalupka, but their literature is meagre Slovak

Lusatian Wendish —This language is divided into two dialects, Upper and Lower, although even these are capable of subdivision The word "Wend," as previously explained, is a purely German name and is never used by the Slavs themselves The Lusatians are also Lusatian Wendish.

sometimes called Serbs and Sorbs They are the remnants of the powerful tribes which once occupied nearly the whole of north Germany The Lusatians in the earlier period of their history were under the dominion of the Poles and afterwards of the Chekhs In the early part of the 17th century the bulk of them had been annexed to the electorate of Saxony, with the exception of the small part about Kottbus, which had belonged to Brandenburg since 1445 In 1815, however, when the states of Europe were rearranged, in most instances with very small regard to the nationalities under their sway, many more of the Lusatians were handed over to Prussia, and, according to the statistics of Boudilovich, at the present time (1886) all the Lower Lusatians, amounting to 40,000, belong to Prussia, as well as 44,000 of the Upper Lusatians Besides the two dialects specified there are other minor ones, to judge from an article in the Bohemian Literary Journal, but they are too minute to be specified here The Upper Lusatian dialect shows most affinity with Chekh, especially in substituting *h* for *g*, the Lower more resembles Polish, and has the strong or barred *ł*, as in *łos*, "hair" The Upper dialect has been the most cultivated, some good grammars have been published by Seiler, Jordan, and Pfuhl and there is a copious dictionary edited by Pfuhl in conjunction with others The language is full of Germanisms and German words and cannot hold out long against the vigorous attempts at denationalization made by its Teutonic neighbours There is a small Lower Lusatian dictionary by Zwahr, a posthumous work of very little merit The Maćica Serbska, the literary society of the Sorbs, founded on the model of the Bohemian Society in 1847, publishes its journal twice a year, which contains interesting articles on folk-tales and folk-lore generally, with popular songs taken down from the mouths of the people

Sorbish literature. The first printed book in the Upper Sorbish language was the little catechism of Luther, published in 1597 by the pastor Worjech This was not, however, the first time that any Lusatian or Sorbish words had been printed, for we find the names of plants in that language given in Franke's *Hortus Lusatiæ*, published in 1594 In 1706 Michael Brancel or Frencel published a translation of the New Testament into Sorbish, a little before, in 1689, a grammar had appeared by Zacharias Bierling, entitled *Didascalia seu Orthographia Vandalica* In 1693-96 Abraham Frencel, son of Michael, published a dictionary In 1806 Mohn translated some extracts from Klopstock's *Messiah* From 1837 a new impulse was given to Sorbish literature newspapers were printed in the language and useful books translated into it One poet has appeared among them, Andrew Seiler, a clergyman, who died in 1872 Lower Sorbish has always been much less developed than Upper The first book printed in it was a collection of hymns and a catechism, by Albin Moller, in 1574 Chojnan, a pastor in Lubin, wrote the first grammar between 1642 and 1664, in the latter half of the same century Korner compiled a dictionary At the commencement of the 18th century Bohumil (Gottlieb) Fabricius published his translation of the New Testament (first edition in 1709), at the end of the same century a version of the Old Testament by Frico appeared A good collection of Sorbish songs has been edited by Haupt and Schmaler According to an interesting article by Hornik in the second volume of the *Slavianski Sbornik*, a number of these Wends emigrated to America and settled in Bastrop county, Texas, where they have divine service performed in their own language, and publish some newspapers

Polabish. *Polabish*.—Of the Slavonic languages spoken in the north of Germany the Lusatian Wendish and Kashoubish are alone living Of those which are extinct Polabish is the only one of which any memorials have come down to us, and these are but scanty The language affords a parallel to Cornish, not only in the few fragments which remain, but also in the date of its decline and extinction It is considered by Schleicher,[1] who has written an excellent grammar by piecing the scanty materials together, just as geologists restore an ichthyosaurus, to have more affinity to Polish than to Chekh, owing to the possession of nasals This interesting language[2] expired in the first quarter of the 18th century in the eastern corner of the former kingdom of Hanover, principally in the circuit of Luchow, which even at the present time is called Wendland Between 1691 and 1786 certain vocabularies and dialogues in this language (including also a song) were taken down, and from them Schleicher has taken the materials for his grammar and the valuable little dictionary appended to it Dr Pfuhl printed these memorials in their entirety in 1863-64 The spelling is altogether phonetic, and, owing to the ignorance of the Slavonic peasant and his German interrogators, the former of German and the latter of Slavonic, there are some ludicrous blunders The two most important of these documents are a German-Wendish dictionary, compiled at the end of the 17th century by Christopher Henning, by birth a Lusatian, and pastor of Wustrow near Luchow Divine service is said to have been held in that town in Wendish as late as 1751 Secondly, we have the Slavonic words and dialogues collected by a farmer named Johann Parum Schultz His manuscript is still in the possession of his descendants There is a valuable monograph on the dialect of the Luneburg Slavs by Biskupski In the 15th century Slavonic had ceased to be spoken in the island of Rugen, and in the same century it could only be heard from peasants in the market place of Leipsic, a town (as already stated) with a Slavonic name What the Slavs, however, have lost in the West they have partly gained in the East, and few languages have a more magnificent prospect than Russian,—the dignity and strength of which fit it to be the tongue of an imperial people (W R M)

SŁAVYANSK, a town of Russia, in the government of Kharkoff, situated 158 miles by rail to the south-east of the town of Kharkoff, on the Torets river and close by several salt lakes From these salt is extracted to the annual value of more than £10,000, there are also several tallow-works in the place The Sławyansk merchants carry on a brisk trade in salt, cattle, and tallow The population (11,650 in 1870) reached 15,400 in 1883

The ancient name of Sławyansk was Tor The town, which is supposed to occupy the site of a former settlement of the Torks (Turks) who inhabited the steppes of the Don, was founded in 1676 by the Russians to protect the salt marshes Having an open steppe behind it, this fort was often destroyed by the Tatars Its salt trade became insignificant in the 18th century and has only revived during the last twenty years since coal was brought from Ekaterinoslaff

SLEEP is a normal condition of the body, occurring periodically, in which there is a greater or less degree of unconsciousness due to inactivity of the nervous system and more especially of the brain and spinal cord It may be regarded as the condition of rest of the nervous system during which there is a renewal of the energy that has been expended in the hours of wakefulness For in the nervous system the general law holds good that periods of physiological rest must alternate with periods of physiological activity, and, as the nervous system is the dominating mechanism in the body, when it reposes, all the other systems enjoy the same condition to a greater or less extent. Rest alternates with work in all vital phenomena After a muscle has contracted frequently at short intervals, a period of relaxation is necessary for the removal of waste products and the restitution of energy, the pulsating heart, apparently working without intermission, is in reality not doing so, as there are short intervals of relaxation between individual beats in which there is no expenditure of energy, the cells in a secreting gland do not always elaborate, but have periods when the protoplasm is comparatively at rest Nervous action also involves physico-chemical changes of matter and the expenditure of energy This is true even of the activity of the brain associated with sensation, perception, emotion, volition, and other psychical phenomena, and therefore the higher nervous centres require rest, during which they are protected from the stream of impressions flowing in from the sense-organs, and in which waste matters are removed and the cerebral material is recuperated for another time of wakeful activity

Time of sleep. The coincidence of the time of sleep with the occurrence of the great terrestrial phenomena that cause night is more apparent than real The oscillations of vital activity are not correlated to the terrestrial revolutions as effect and cause, but the occurrence of sleep, in the majority of cases, on the advent of night is largely the result of habit Whilst the darkness and stillness of night are favourable to sleep, the state of physiological repose is determined more by the condition of the body itself Fatigue will normally cause sleep at any time of the twenty-four hours Thus many of the lower animals habitually sleep during

---

[1] *Laut- und Formen Lere der Polabischen Sprache*, St Petersburg, 1871

[2] To avoid confusion it must be remembered that the word "Polabish" is used somewhat carelessly by ethnologists to denote (1) the Slavonic tribes in north Germany generally, (2) the particular Slavonic tribe on the Elbe (Slav *Laba*)

the day and prowl in search of food in the night, some hibernate during the winter season, passing into long periods of sleep during both day and night, and men whose avocations require them to work during the night find that they can maintain health and activity by sleeping the requisite time during the day.

Symptoms. The approach of sleep is usually marked by a desire for sleep, or sleepiness, embracing an obscure and complicated group of sensations, resembling such bodily states of feeling as hunger, thirst, the necessity of breathing, &c. All of these bodily states, although on the whole ill defined, are referred with some precision to special organs. Thus hunger, although due to a general bodily want, is referred to the stomach, thirst to the fauces, and breathing to the chest; and in like manner the desire for sleep is referred chiefly to the region of the head and neck. There is a sensation of weight in the upper eyelids, intermittent spasm of the sub-hyoid muscles causing yawning, and drooping of the head. Along with these signs there is obscuration of the intelligence, depression both of general sensibility and of the special senses, and relaxation of the muscular system. The half-closed eyelids tend more and more to close; the inspirations become slower and deeper; the muscles supporting the lower jaw become relaxed, so that the mouth opens; the muscles of the back of the neck that tend to support the head also relax and the chin droops on the breast; and the limbs relax and tend to fall into a line with the body. At the same time the hesitating utterances of the sleepy man indicate vagueness of thought, and external objects gradually cease to make an impression on the senses. These are the chief phenomena of the advent of sleep. After it has supervened there are many gradations in its depth and character. In some cases the sleep may be so light that the individual is partially conscious of external impressions and of the disordered trains of thought and feeling that pass through his mind, constituting dreams, and these may be more or less vivid according to the degree of consciousness remaining. On the other hand, the sleep may be so profound as to abolish all psychical phenomena; there are no dreams, and when the sleeper awakes the time passed in this unconscious state is a blank. The first period of sleep is the most profound. After a variable period, usually from five to six hours of deep sleep, the faculties awaken, not simultaneously but often fitfully, so that there are transient periods of consciousness. This is the time of dreaming. As the period of waking approaches the sensibility becomes more acute, so that external impressions are faintly perceived. These impressions may influence and mould the flow of images in the mind of the sleeper, frequently altering the nature of his dreams or making them more vivid. The moment of waking is usually not instantaneous, but is preceded by an intermediate state of partial consciousness, in which there are feelings of a pleasant lassitude, a sense of repose, a luxurious abandonment of the body to any position in which it may happen to be, and a strange play of the mental faculties that has more of the character of an "intellectual mirage" than of consecutive thought.

Intensity. The intensity of sleep has been measured by Kohlschutter by the intensity of the sound necessary to awaken the sleeper. This intensity increases rapidly during the first hour, then decreases, sometimes rapidly, sometimes slowly, during the next two or three hours, and then very slowly until the time of waking. This statement agrees generally with experience. As a rule the deeper the sleep the longer it lasts.

Physiological changes. Various physiological changes have been observed during sleep, but much remains to be done in this direction. The pulse becomes less frequent; the respiratory movements are fewer in number and are almost wholly thoracic, not abdominal; all the secretions are reduced in quantity; the gastric and intestinal peristaltic movements are less rapid; the pupils of the eye are contracted and during profound sleep are not affected by light; and the eyeballs are rotated upwards. The pupils dilate slightly when strong sensory or auditory stimuli are applied, and they dilate the more the lighter the sleep; at the moment of waking they become widely dilated. Whilst muscular relaxation is general, there seems to be increased contraction of certain sphincter muscles, as the circular fibres of the iris and the fibres concerned in closing the eyelids. The state of the circulation of the brain has been frequently investigated. The older view was that there was a degree of plethora or congestion of the vessels of the brain, as is the state of matters in coma, to which the state of sleep has a superficial resemblance. Coma, however, is not sleep, but a condition of inactivity of the cerebral matter owing to the accumulation of dark venous blood in its vessels. This has been actually observed in cases where it was possible to see the brain. During sleep the surface of the exposed brain has been observed to become pale and to shrink somewhat from the sides of the opening (Blumenbach). A careful experimental research was conducted by Arthur E. Durham in 1860, in which he trephined a portion of bone as large as a shilling from the parietal region of a dog, and, to obviate the effects of atmospheric pressure, inserted a watch glass into the aperture so that the surface of the brain could be seen. His results are summarized thus:— Durham's observations.

> "(1) Pressure of distended veins on the brain is not the cause of sleep, for during sleep the veins are not distended; and, when they are, symptoms and appearances arise which differ from those which characterize sleep. (2) During sleep the brain is in a comparatively bloodless condition, and the blood in the encephalic vessels is not only diminished in quantity, but moves with diminished rapidity. (3) The condition of the cerebral circulation during sleep is, from physical causes, that which is most favourable to the nutrition of the brain tissue; and, on the other hand, the condition which prevails during waking is associated with mental activity, because it is that which is most favourable to oxidation of the brain substance, and to various changes in its chemical constitution. (4) The blood which is derived from the brain during sleep is distributed to the alimentary and excretory organs. (5) Whatever increases the activity of the cerebral circulation tends to preserve wakefulness; and whatever decreases the activity of the cerebral circulation, and, at the same time, is not inconsistent with the general health of the body, tends to induce and favour sleep. Such circumstances may act primarily through the nervous or through the vascular system. Among those which act through the nervous system may be instanced the presence or absence of impressions upon the senses, and the presence or absence of exciting ideas. Among those which act through the vascular system may be mentioned unnaturally or naturally increased or decreased force or frequency of the heart's action."

Dr William A. Hammond and Dr Weir Mitchell have repeated and extended Durham's observations, with the same general results (1866), and more recently Ehrmann, Salathé (1877), François Franck (1877) and Mosso (1881), by more refined methods of observation, have arrived at the same general conclusions. Mosso in particular has applied with great success the graphic method of registration to the study of the movements of the brain and of the circulation during sleep. He made observations on three persons who had lost a portion of the cranial vault and in whom there was a soft pulsating cicatrix. They were a woman of thirty-seven years of age, a man of thirty-seven years, and a child of about twelve years. By special arrangements, Mosso took simultaneous tracings of the pulse at the wrist, of the beat of the heart, of the movements of the wall of the chest in respiration, and of the movements of the denuded brain. Further, by means of the plethysmograph,—an instrument of Mosso's own invention,—he obtained tracings showing changes in the volume of the hand and forearm; and he succeeded in showing that during sleep there is a diminished amount Mosso's experiments.

of blood in the brain, and at the same time an increased amount in the extremities He showed further that there are frequent adjustments in the distribution of the blood, even during sleep Thus a strong stimulus to the skin or to a sense organ—but not strong enough to awaken the sleeper—caused a contraction of the vessels of the fore-arm, an increase of blood pressure, and a determination of blood towards the brain, and, on the other hand, on suddenly awakening the sleeper, there was a contraction of the vessels of the brain, a general rise of pressure, and an accelerated flow of blood through the hemispheres of the brain So sensitive is the whole organism in this respect, even during sleep, that a loudly spoken word, a sound, a touch, the action of light, or any moderate sensory impression modified the rhythm of respiration, determined a contraction of the vessels of the forearm, increased the general pressure of the blood, caused an increased flow to the brain, and quickened the frequency of the beats of the heart These observations show how a physiological explanation can be suggested of the influence of external impressions in modifying the dreams of a sleeper Further, Mosso found that during very profound sleep these oscillations disappear the pulsatory movements are uniform and are not affected by sensory impressions, and probably this condition exists when there is the absolute unconsciousness of a "dead" sleep By such methods as have been employed by Mosso, three movements of the brain have been observed,—(1) *pulsations*, corresponding to the beats of the heart, (2) *oscillations*, or longer waves, sometimes coinciding with the heart beats, or more generally consisting of longer festoons, carrying each a number of smaller waves, and believed to correspond generally to the respiratory movements, and (3) *undulations*, still longer and less marked elevations and depressions, first clearly observed by Mosso, and believed by him to indicate rhythmic contractions of the vessels of the pia mater and of the brain This view is in keeping with the observations of Donders, Kussmaul, Tenner, and others on changes of calibre observed in the cerebral vessels, and with the experiments of many physiologists, showing that the vessels of the pia mater, like other vessels, are controlled by the vaso-motor system of nerves (see PHYSIOLOGY, "Nervous System") It may therefore be considered certain that during sleep there is an anæmia, or partially bloodless condition, of the brain, and that the blood is drawn off to other organs, whilst at the same time this anæmic condition may be modified by changes in the circulation or in the respiratory mechanism caused by position, by sensory impressions, or by sudden changes in the state of repose of the muscles The examination of the retina (which may be regarded as a cerebral outwork) by the ophthalmoscope during sleep also shows a comparatively bloodless condition Such are the facts, the deficiency in the way of a theoretical explanation is that physiologists cannot satisfactorily account for the anæmic condition causing unconsciousness Sudden hæmorrhage from the brain and nerve-centres, or a sudden cessation of the supply of blood to the brain, as occurs in syncope (failure of the heart's action,—a faint), no doubt causes unconsciousness, but in these circumstances there is a tendency to convulsive spasm Such spasm is usually absent in sleep, but sudden jerks of the limbs may sometimes be observed during the time when there is the confusion of ideas preceding the passage into sleep

During sleep the amount of carbonic acid eliminated is very much reduced, indicating that molecular changes in the tissues do not occur to the same extent as in the waking state This is also shown by the fact that less heat is produced Helmholtz states that the amount of heat produced by a man weighing 67 kilogrammes (147 4 lb) is about 40 calories per hour during sleep, as against 112 calories per hour while awake This diminished production of heat may be largely accounted for by the quiet condition of the muscles of locomotion, but it also indicates diminished tissue changes throughout the body In profound sleep the bodily temperature may fall from 6° to 2° Fahr In consequence of diminished oxidation changes during sleep, it is not improbable that excess of nutrient matter may then be stored up in the form of fat, and that thus the proverb "He who sleeps dines" is based on a correct appreciation of the fact that sleep tends to produce plethora or obesity

Theories as to cause of sleep

Whilst it is easy to state that sleep is caused by fatigue of the nervous system, it is a more difficult matter to explain what the precise changes are that produce the state of unconsciousness. Various hypotheses have been advanced, but it cannot be said that any one is wholly satisfactory Aware that the fatigue of muscle is associated with the accumulation of sarcolactic acid, Preyer surmised that the activity of nervous matter might be interfered with by the accumulation in the nerve-centres of some such acid, or of its soda salt (lactate of soda), but this view has not been supported by the results of experiment, as the injection into the blood of a dose of lactate of soda has not produced sleep Pflüger has observed that frogs deprived for a considerable time of oxygen passed gradually into a state resembling profound sleep, and he has advanced the theory that there is no organ of the body so quickly affected by deprivation of oxygen as the brain According to Pflüger, the phenomena of life depend on a dissociation of living matter, and in particular the activity of the cerebral substance connected with psychical states depends on dissociation changes in the grey matter To excite the dissociation, however, oxygen is necessary The oxygen unites with certain of the compounds set free by the dissociation, forming, amongst other substances, carbonic acid If such matters as these that unite with oxygen are in sufficient amount to use up all the oxygen, the grey matter of the brain suffers from a deficiency of oxygen (or from its absence), and also from the accumulation of carbonic acid According to such a theory, cerebral activity depends on cerebral respiration, and sleep is a kind of cerebral asphyxia Some such condition is not improbable, but it must be stated that the evidence at present in support of it is meagre Possibly, in attempting to account for the phenomenon of sleep, too much importance has been attributed to the changes occurring in the brain, forgetting that not merely brain matter but every tissue of the body becomes exhausted by work, and that sleep may be partly due to phenomena occurring throughout the body and not in the brain alone Some more comprehensive hypothesis than any yet advanced may be possible when the condition of all the functions during sleep has been more thoroughly investigated

All the phenomena of sleep point to a diminished excitability of the cerebral nerve-centres and of the spinal cord Contrary to what is often stated, there can be no doubt that reflex action is in partial abeyance and that the spinal cord is in a state of partial inactivity as well as the brain The only nerve-centres that do not sleep are those absolutely essential to life, such as those connected with the heart, with respiratory movements, and with the distribution of blood by the vaso-motor arrangements, and Mosso's experiments indicate that even these have a certain amount of repose in profound sleep

Sleeping in animals

There is little doubt that all living beings require periods of repose alternating with periods of activity Many plants close their flowers and bend their petioles at certain times of the day These phenomena, called "the sleep of plants," depend apparently on changes in solar radiation,

and there is no reason to believe that during the time of quiescence any reparative processes go on, as during the sleeping period of animals Naturalists have observed many of the lower animals apparently in a state of sleep Insects, crustaceans, fishes, reptiles, may all be observed occasionally to be almost motionless for considerable periods of time The sleeping of birds is familiar to all, and in these there are anatomical arrangements by which the bird may, like the crane, sleep perched on one leg, or grasping a branch with both feet, like perching birds generally, without any muscular effort and consequently without fatigue

Amount of sleep required by man

The amount of sleep required by man varies according to age, sex, and habit The popular notion that a child sleeps half its time, an adult one-third, whilst an old person may do little except eat and sleep is not far wrong In early life the cerebral faculties appear to be easily exhausted and during the frequent and prolonged sleeps of infancy the brain rests and the vegetative changes connected with nutrition and growth go on actively As life advances, less sleep is required, until in adult life a period of seven or eight hours is sufficient As a rule, women require more sleep than men, but much depends on habit Thus most women bear the loss of sleep in the first instance better than men, because they have been accustomed more to loss or irregularity of sleep The effect of habit is well seen in nurses, both male and female, who will often be able to work for weeks continuously with snatches of sleep, not amounting to more than two or three hours daily Sooner or later, however, even in these cases nature asserts her demands, and prolonged sleep is necessary to maintain health and vigour

Insomnia

Wakefulness during the time when one ought to be asleep is frequently a distressing condition, undermining the strength and incapacitating for active and efficient work Insomnia or sleeplessness often afflicts those of active mental habits and lays the foundation of premature decay From what has been stated as to the cause of sleep it is evident that whatever tends to augment unduly the circulation through the brain may cause wakefulness Thus long continued or excessive intellectual action, or any powerful emotion, may be injurious Moderate intellectual work is favourable to sleep The remedy in such cases is to avoid as far as possible the exciting causes or to counteract them by bodily exercise and attention to the general health When sleeplessness overtakes a brain-worker it is a sure indication that less intellectual work must be done, and that he ought to betake himself, if possible, to out-of-door exercise in the pure air of the country It is dangerous to persist, and still more to induce sleep artificially by drugs, as the overworked organ may become the seat of permanent disease or pernicious habits may be formed The posture of the body in bed may influence sleep Thus such positions as impede the flow of blood from the brain without affecting the supply of blood to it by the arteries may cause sleeplessness Sometimes in cases of insomnia from excessive mental work there is the distressing condition that sleep disappears when the person lies down in bed, although before lying down he felt drowsy In such a case resting with the head high may produce the desired result Insomnia may also be caused by various functional diseases, whereby the amount of blood in the brain is increased Thus in young females derangement of the menstrual functions may cause a hyperæsthesia or increased sensibility to such an extent that the sufferer cannot sleep, or, if sleep be obtained, it is so light as to be dispelled by weak sensory impressions that would fail to arouse a healthy person Again, an irregular or deficient action of the heart may cause wakefulness, especially if associated with coldness of the extremities In such cases the application of heat to the feet and attention to the digestive organs may produce refreshing sleep Lastly, the excessive use of various drugs, such as alcohol, opium, belladonna, Indian hemp, tea, and coffee, may cause sleeplessness In these cases a moderate dose usually acts as a hypnotic, whilst frequently repeated doses have the reverse effect Thus sleeplessness is one of the most distressing symptoms of delirium tremens, and it occurs also in those in the habit of indulging in opium, morphia, chloral, or Indian hemp The general correctives of sleeplessness are active work, a moderate amount of bodily exercise, freedom from worry and anxiety, the use of the warm bath in some cases to allay irritability before going to bed, and such a posture in bed as the individual has found in his own case to be favourable Sometimes a light but nutritious meal about an hour before retiring may conduce to sleep, but as a rule late suppers are unfavourable The use of drugs should be indulged in only with medical advice It is not too much to say that the injudicious use of bromide of potassium, chloral, opium, morphia, and stimulants by literary persons to procure sleep has often been productive of sad results, such as shattered health, an incurable habit of self-indulgence, and even accidental death (see Hammond, *On Wakefulness*)

Hypnosia

It is a matter of common observation not only that certain persons require more sleep than others but that they have less power of resisting its onset and of awaking This condition may become morbid, constituting a veritable nervous disease, to which the name "maladie du sommeil" or *hypnosia* may be given It may be described as invincible sleep, and it may continue for weeks and for months, terminating in convulsive seizures, and even death A persistent drooping of the upper eyelid has been observed even during waking hours Dr W Ogle has observed in such cases an engorgement of the cervical ganglia of the sympathetic, but this may have nothing to do with the condition Cases of very prolonged sleep are not uncommon, especially amongst hysterical females, lasting four, seven, or ten days On awaking the patient is exhausted and pale, with cold extremities, and not unfrequently, after a brief interval of waking, passes off into another lethargic sleep Something similar to this may be seen in very aged persons towards the close of life

Dreaming

Dreams (cf Dream, vol vii p 452 *sq*) only occur when sleep is light, and they indicate that consciousness is still continued The characteristic feature of dreaming is that the mind has no control over the groups of images that crowd upon it These images are either revivals of old sensory impressions that have been stored up in the brain or they are the result of an untrammelled imagination The will has lost the power of direction and control, ideas, often grotesque, always confused, rise apparently spontaneously, are vivid for an instant, and then disappear Dreaming may be described as a kind of physiological delirium A consideration of the state indicates that the cerebral hemispheres are partially active and that it is the inhibitory power that is deficient (see Physiology, "Nervous System") A further explanation cannot be given in the present state of our knowledge of cerebral physiology, but some of the more evident conditions or laws of the dreaming state may be indicated (1) The character of dreams is often determined by a predominant thought or train of ideas that has occupied the mind before going to sleep Thus the events of the preceding day may produce a particular kind of dream, and not unfrequently when a person attempts on waking to unravel his dream he may find the connecting thread in an occurrence or in a conversation or in the thoughts suggested by a book on the previous day It would thus seem that the memory of recent things (and physiologically there must be an organic basis for memory) may revivify old and apparently forgotten impressions (2) In dreaming, the train of thought may be influenced by impressions made on the senses of the sleeper, sufficiently intense to produce this result, but not intense enough to awake him Thus a sudden sensory impression, such as a loud sound, a current of cold air, a restrained position of one of the limbs, a word or sentence uttered by a familiar voice, may arouse a dream or turn the disordered throng of fancies in a new direction In some instances, the dreamer is peculiarly susceptible to such external impressions, so that the same stimulus will always give rise to the same kind of dream (3) It has frequently been observed that in dreaming there may be memories of old impressions, scenes, faces, words, that have long since faded from the recollection during waking hours, showing that many impressions that are supposed to be lost are only forgotten and require but the appropriate stimulus to cause them to start vividly into mental life (4) In rare instances there may be consecutive thought in dreams, so that the dreamer may write verse, frame speeches, or even work out mathematical problems Most persons have had experience of this strange kind of power and have regretted, in the partially conscious state before awaking, that they could not preserve some of the results, feeling assured that the sober reality of waking life would dispel the vision (5) Dreams make only a feeble impression on the memory, so that on awaking what is at first vivid and distinct fades insensibly and rapidly away This may be accounted for by the evanescent character of the mental "stuff" of dreams In the waking state an act of attention is required to fix anything in the memory, and, as this is absent in dreaming, the impressions do not leave a permanent effect For this reason also in dreams we have no memory of former dreams (6) All have observed that there is no feeling of time or of space in dreams We live in an ideal world This probably arises from the absence of fixity of thought, so that there is no apparent connexion between the successive pictures of the imagination (7) In some dreams the activity of the cerebrum is such that the train of thoughts prompts to movement, and the sleeper may be heard muttering in his sleep or tossing the arms or making gestures There are gradations between this condition of a "troubled" dream and that of true somnambulism

Somnambulism

Somnambulism —Some persons rise during sleep, walk about, apparently unconscious of all external impressions, after a time

return to bed, and when they are awake they have no recollection of any of these occurrences Sometimes the actions performed are of a complicated character and bear some relation to the daily life of the sleeper Thus a cook has been known to rise out of bed, carry a pitcher to a well in the garden, fill it, go back to the house, fill various vessels carefully and without spilling a drop of water, then return to bed, and have no recollection of what had transpired Again, somnambulists have been observed to write letters or reports, execute drawings, and play upon musical instruments Frequently they have gone along dangerous paths, executing delicate movements with precision Four types of somnambulist may be noticed,—(1) those who speak without acting, a common variety often observed in children and not usually considered somnambulistic, (2) those who act without speaking, also well known and the most common type, (3) those who both act and speak, more exceptional, and (4) those who both act and speak and who have not merely the sense of touch active but also the senses of sight and hearing The fourth class is the most extreme type and merges into the physiological condition of mesmerism or hypnotism This peculiar condition has already been fully described under animal magnetism (see MAGNETISM, ANIMAL), and it is necessary here only to notice it in connexion with the subject of sleep Many observations indicate that, at all events in some cases, the somnambulist, engaged, for example, in writing, has a mental picture of the page before him and of the words he has written He does not see what he really writes This has been proved by causing persons to write on a sheet of paper lying on the top of other sheets After he has been allowed to write a few sentences, the sheet was carefully withdrawn and he continued his writing on the next sheet, beginning on the new sheet at the corresponding point where he left off on the first one Moreover, the somnambulist, by force of habit, stroked t's and dotted i's at the exact places where the t's and i's would have been had he written continuously on one sheet, showing that what he was conscious of was not what was before him but the mental picture of what he had done

The following table, modified from two such tables given by Ball and Chambard in their exhaustive article "Somnambulisme" in the *Dictionnaire Encyclopedique des Sciences Medicales*, shows the relation of the various intermediate conditions of sleeping and awaking and of the dreaming and somnambulistic states The horizontal stroke indicates the presence of the condition the name of which heads the column —

	Organic Life	Consciousness	Imaginative Faculties	Co ordinating Faculties	Power of Movement and Sensibility
Normal waking state	—	—	—	—	—
Sleep, 1st degree	—	—	—	—	
„ 2d degree	—	—	—		
„ 3d degree	—	—			
Deep sleep	—				
Waking, 1st degree	—	—			
„ 2d degree (specially dreaming state)	—	—	—		
„ 3d degree	—	—	—	—	
Complete waking	—	—	—	—	—
Dreaming state	—	—	—		
Ordinary somnambulism —(2) above	—		—	—	—
Profound somnambulism (perfect unconsciousness)	—				—
Somnambulistic dream (movements in a dream)	—		—		—

The somnambulist acts his dream His condition is that of a vivid dream in which the cerebrum is so active as to influence centres usually concerned in voluntary movements Under the dominant idea he executes the movements that this idea would naturally excite in the waking state Many of his movements are in a sense purposive, his eyes may be shut so that the movements are executed in the dark, or the eyes may be open so that there is a picture on the retina that may awaken no consciousness, and yet may, by reflex mechanisms, be the starting-point of definite and deliberate movements In many cases he does not hear, the auditory centres not responding, but in others suggestive words may alter the current of his dream and lead him to perform other actions than what he intended to do On awaking there is either no memory of what has taken place or the dim recollection of a fading dream

It is important to notice that there is scarcely any action of which a somnambulist may not be capable, and immoral acts from which the individual would shrink in waking hours may be performed with indifference Considering the abrogation of self-control peculiar to the physiological condition, it is evident that no moral responsibility can be attached to such actions In cases where somnambulistic propensities place a person in danger, an endeavour should be made to induce him to return to bed without awaking him, as a rude awakening may produce a serious shock to the nervous system Inquiry should then be made into the exciting cause of the somnambulistic dream, such as a particular train of thought, over-excitement, the reading of special books, the recollection of an accident or of a crisis in the person's history, with the view of removing the cause if possible It should never be forgotten that somnambulism, like chorea, hysteria, and epilepsy, is the expression of a general morbid predisposition, an indication of a nervous diathesis, requiring careful treatment so as to avoid more dangerous maladies

See article "Sommeil" in the *Dictionnaire Encyclopedique des Sciences Medicales*, where a full bibliography is given and where also there is an account of the medico legal questions connected with sleep and somnambulism, Macnish, *Physiology of Sleep*, Durham, "On the Physiology of Sleep," in Gay's *Hospital Reports*, 1860, Kohlschutter, "Die Mekanik des Schlafes," in *Z f ration Med*, vol xxviii, 1869, Pfluger, "Theorie des Schlafes, in *Pfluger's Archiv* vol x, 1875, Mosso, *Ueber den Kreislauf des Blutes im menschlichen Gehirn*, Leipsic, 1881 As to somnambulism, see the article on the subject in the *Dictionnaire* both for full details and a copious bibliography (J G M)

SLEIDANUS, JOHN (*c* 1506-1556), the annalist of the Reformation, was born at Schleiden (now a small village in the Oleffthal, about 42 miles south-west of Cologne) in 1506 or 1508 Passing from the village school, he studied at Liége, Cologne (?), Louvain (where he became tutor to the son of Count Manderscheid of Schleiden), Paris, and Orleans (where he studied law) In 1536 he became secretary to Cardinal du Bellay, minister of Francis I, and spent five years with him and with his brother Cardinal Guillaume du Bellay The cardinals Du Bellay belonged to that party among the French nobility who desired on political grounds an alliance betwen the German Protestants and Francis against the emperor Charles V, and who employed the leaders of the Strasburg citizens as intermediaries Sleidanus, whilst among the humanists of Liége, had adopted Protestant opinions, had learned to distrust the Romanist policy of Charles V, and was himself a strong supporter on religious and political grounds of the plans of the brothers Du Bellay Their confidence in him was such that he was sent (1540) to watch the conduct of the French ambassador at Hagenau, and this brought him into personal relation with the German Protestant leaders Next year Du Bellay sent him to confer with the heads of the Schmalkaldic League, when he found his patron's ideas unacceptable Philip of Hesse and the elector of Saxony would make no alliance with a foreign power against the emperor, and distrusted Francis personally because of his persecution of French Protestants It is possible that this news made Du Bellay feel that he had no further need for his secretary, for we find Sleidanus leading a wandering life for two years, and finally making Strasburg his home, although he still kept up a political correspondence with France Sleidanus had been accustomed to copy all documents bearing upon the Reformation to which he had access, and Bucer, who had seen his collection, proposed to Philip of Hesse to appoint him historian of the Reformation, giving him a salary and access to all necessary documents After some delay the heads of the Schmalkaldic League agreed to Bucer's proposal, and Sleidanus began his great work and finished the first volume in 1545 In that year he was again recalled to diplomacy and went to England in a French embassy to Henry VIII While there he diligently collected materials for his history On his return to Strasburg he was sent by that city as one of its representatives to the diets of Frankfort and Worms, and thence he proceeded to Marburg to explore the archives of Philip of Hesse The Schmalkald War interfered with this work and also prevented the payment of Sleidanus, who in his difficulties applied to England for aid, and at Cranmer's intercession received a yearly pension (not long continued) from Edward VI In 1551 Sleidanus went to the council of Trent as representative from Strasburg, charged also with full powers to act for the imperial cities Esslingen, Ravensburg, Reutlingen, Biberach, and Lindau On his return his friends got him appointed professor of law in Strasburg, and he was once more able to give his whole attention to his great work, which he finished for the press

in 1554 But want of money, the death of his wife—whom he had married in 1546 on his return from the diet of Frankfort—and other misfortunes compelled him to delay printing The book at length appeared,—*Commentariorum de statu religionis et reipublicæ, Carolo V Cæsare, Libri XXVI* (translated into English by John Daws in 1560 and by G Bohum in 1689) But the troubles of Sleidanus were not ended The work was too impartial to please any one, and even the gentle Melanchthon was unable to praise it It remains notwithstanding the most valuable contemporary history of the times of the Reformation, and contains the largest collection of important documents The author died at Strasburg in October 1556 in poverty, and inconsolable since the death of his wife

See H Baumgarten, *Ueber Sleidanus Leben und Briefwechsel* (1878), and *Sleidans Briefwechsel* (1881)

SLIGO, a maritime county in the north-west of Ireland, in the province of Connaught, is situated between 53° 54′ and 54° 28′ N lat and between 8° 10′ and 9° 10′ W long, and is bounded N by the Atlantic, E by Leitrim, S E by Roscommon, and S and W by Mayo The total area is 451,129 acres, or nearly 705 square miles Its greatest length from north to south, between Mullaghmore Head and Lough Gara, is 38 miles and its greatest breadth from east to west is 41

The coast-line is very irregular and in some places rises into grand escarpments and terraces The principal inlets are Killala Bay and Sligo Bay, the latter subdivided into Brown Bay, Drumcliffe Bay, and Ballysadare Bay Near the coast are the islets of Inishmurray, Coney, and Oyster Though Sligo cannot be compared for scenery with the western parts of Mayo, it is in many places charmingly picturesque, being well wooded and possessing several fine lakes and rivers, as well as some ranges of hills which from their situation and grouping have a very striking effect In the north are the limestone elevations of Benbulbin (1722 feet) and Knocknarea (1078), contrasting finely with the adjacent rugged gneiss mountains, among which are King's Mountain (1965 feet) and Gullogherboy (1430) In the west are the ranges of the Slieve Gamph and Ox Mountains, 1300 and 1600 feet respectively The Curlew Mountains (nearly 900 feet high) separate Sligo from Roscommon The principal rivers are the Moy, forming for a part of its course the boundary with Mayo, and flowing south-westwards and then northwards into Killala Bay, the Easky, flowing northwards from Lough Easky, the Ballysadare, with its branches the Owenmore, Owenbeg, and Arrow or Unshin, and the Garvogue, flowing from Lough Gill Except the finely situated Lough Gill (3130 acres) extending into Leitrim, Lough Arrow (3010), and Lough Gara (3683), none of the lakes have so large an area as 400 acres

The Carboniferous Mountain Limestone forms the basis of a great part of the county, and includes the Lower Limestone calp or black shale series and the Upper Limestone, which rises occasionally into a lofty tableland There is a small tract of Yellow Limestone in the extreme north, as also on the north and north-east of Lough Gara, whence it extends into Mayo The Old Red Sandstone appears in two masses near Lough Arrow A small tract of granite enters the county on the south-west, coming from between Lough Conn and Foxford in Mayo, giving place to a broad belt of trap porphyry bounded by a narrow fringe of Old Red Sandstone, which stretches in a north-easterly direction along the line of the Ox Mountains to Ballysadare Bay Iron is abundant, especially in the neighbourhood of the Ox Mountains, but from want of fuel is not worked Pure copper is found in the beds of some of the rivers, and sulphate of copper and iron pyrites occur in some places

Agriculture —There is considerable variety both in the character of the soil and in the agricultural advancement in different parts of the county In some parts it is a light sandy loam resting on a freestone bottom, and in the lower districts a rich and deep mould prevails resting on a substratum of limestone Owing to the moistness of the climate cattle feeding is found to be the most remunerative method of farming Out of a total of 451,129 acres 231,753 or 51 3 per cent in 1884 were under grass, 86,365 under crops, 38,431 bog and marsh, 70,599 barren mountain land, 7577 woods and plantations, and 417 fallow, the remaining 15,987 acres being under water, roads, fences, &c The total number of holdings was 15,352, there being 752 under 1 acre, 1443 between 1 and 5 acres each in extent, 5834 between 5 and 15, 4592 between 15 and 30, 1520 between 30 and 50, and 1211 of 100 acres and upwards The total area under corn crops in 1884 was 24,324 acres, while in 1875 it was 30,810, under green crops 25,897, in 1875 30,491, under meadow and clover 36,120, in 1875 32,396, and under flax 24, in 1875 175,—the total area under tillage having decreased between 1875 and 1884 from 93,872 to 86,365 acres Of the corn crops in 1884 oats occupied 23,055 acres, and green crops and potatoes 19,835 The number of horses between 1875 and 1884 increased from 7244 to 8292, of asses from 7588 to 8471, cattle decreased from 97,658 to 89,458, sheep from 65,857 to 64,324, pigs, again, increased from 19,726 to 26,996, goats from 3081 to 4745, and poultry from 277,113 to 305,509 According to the landowners return Sligo was divided among 856 proprietors, possessing 448,397 acres at an annual value of £210,382, or about 9s 4½d per acre The principal proprietors were Colonel E H Cooper, 34,120 acres, Sir Robert Gore Booth, 31,774, Charles W O'Hara, 21,070, W R O Gore, 21,019, Owen Wynne, 12,982, Colonel King Harman, 12,629, Hon Evelyn Ashley, 12,426, and William Phibbs, 10,507

Manufactures and other Industries —Coarse woollens and linens are manufactured for home consumption, and there are tanneries, distilleries, and breweries in the principal towns A considerable general trade is carried on at the ports of Ballina (on the Moy) and Sligo The fisheries on the coast are valuable, and there are important salmon fisheries at the mouths of the rivers

Administration and Population —The county is divided into 6 baronies, and contains 37 parishes and 4 parts of parishes, and 1292 townlands The county has three poor law unions—Dromore West, Sligo, and Tobercurry—with parts of the unions of Ballina and Boyle (Roscommon) It is in the Connaught circuit, and assizes are held at Sligo and quarter sessions at Ballymote, Easky, and Sligo It is in the Dublin military district, and there are barracks at Sligo For parliamentary representation the county has since 1885 formed two divisions (North and South), each returning a member Between 1841 and 1851 the population decreased from 180,886 to 128,515 or 29 per cent, and by 1881 it had decreased to 111,578 (55,144 males, 56,434 females), or 38 3 per cent since 1841 In 1881 the number of persons who could read and write was 52,602, who could read only 15,574, who could neither read nor write 43,402 There were 2326 who could speak Irish only, while 24,263 could speak Irish and English There were 10 superior schools with 266 pupils, of whom 142 were Catholics and 124 Protestants, and 211 primary schools with 13,714 pupils, of whom 12,070 were Catholics and 1644 Protestants The principal towns are Sligo (population 10,808 in 1881), Ballina (1442 in Sligo and 4318 in Mayo), Ballymote (1145), and Tobercurry (1081)

History and Antiquities —In the time of Ptolemy the district was inhabited by the *Nagnatæ*, the capital *Nagnata* being somewhere near the site of the present town of Sligo Afterwards it was possessed by a branch of the O'Connors, called O'Connor Sligo On the landing of Henry II it gradually fell into the power of the De Burgos The district formed part of Connaught, which, in the reign of Elizabeth, was divided into seven counties On the lands of Carrowmore, between Sligo and Ballysadare, there is a remarkable collection of Druidical remains, consisting of cairns, a circle, cromlechs, and pillar stones At Drumcliffe is the only round tower now remaining in the county, and a beautiful Celtic cross 13 feet in height The principal monastic ruins are the abbey of St Fechan at Ballysadare, with an ancient church displaying some curious architecture of the 11th or 12th century, the remarkable group of buildings on Inishmurray, and the abbey of Sligo, noticed under the town below There are a considerable number of old castles, but none of special interest

SLIGO, the chief town of the above county and an important seaport, is finely situated at the mouth of the Garvogue, near Lough Gill, 137 miles north-west of Dublin by rail The town is rather irregularly built and has a decayed appearance, which somewhat belies its actual prosperity Formerly it was fortified by a castle and walls, but of these there are now no remains The abbey, founded in 1252 by Maurice Fitzgerald, lord-justice, is one of the finest monastic ruins in Ireland It was partly destroyed by fire in 1414 and again in 1642 Within recent years measures have been taken to preserve it Three sides of the cloister of the quadrangle still remain, and the lofty quadrangular tower at the junction of the nave and chancel is entire The eastern window, still very perfect, is of the date of the original structure The

principal modern buildings are the new Catholic cathedral, in the Norman style with a finely sculptured doorway, the town-hall (1865-66), the county court-house, the custom-house, the lunatic asylum, and the barracks. The quays are commodious, and steamers ply to and fro between Sligo and Glasgow, Liverpool, and Londonderry,—the principal exports being cattle, fowls, eggs, and butter, and the imports coal, iron, timber, and provisions. The port is under the control of harbour commissioners. There is an important butter-market, and maize, flour, and corn mills. The population in 1861 was 10,693, and in 1881 it was 10,808.

A castle was built at Sligo by Maurice Fitzgerald in 1242, which in 1270 was taken and destroyed by O'Donnell, in 1310 it was rebuilt by Richard, earl of Ulster, and was again partly destroyed in 1369 and 1394. Early in the reign of James I. the town received a market and two annual fairs, in 1613 it was incorporated and received the privileges of a borough, and in 1621 it received a charter of the staple. In 1641 it was besieged by the Parliamentary forces under Sir Charles Coote, but was afterwards evacuated, and occupied by the Royalists till the termination of the war. In 1688 it declared in favour of James II., and, after being captured by the Enniskilleners, was retaken by General Sarsfield, but ultimately surrendered to the earl of Granard. The borough was disfranchised in 1870.

SLIVEN, Slivno, Selimnia, Islemniye, or Islimye, an important town of East Roumelia, situated at the southern base of the Balkans, 750 feet above the sea, where several mountain streams flow south to the Tunja, a tributary of the Maritza. The luxuriant foliage of its trees and the general picturesqueness of its appearance gain in effect by the contrast which they present with the bare gneiss and porphyry summits that rise immediately to the north. On the south it is surrounded by orchards, gardens, and extensive mulberry plantations. Besides a large number of mosques, the public buildings comprise a synagogue and four Christian churches, but there is nothing of much architectural interest in the town. A Government factory for the manufacture of military clothing was established in 1834; there is a good silk industry, and Sliven red wine is famous. The population (Turks, Bulgarians, Armenians, Greeks, Jews, and Gipsies) was 22,000 in 1872.

Sliven, the Sthlifanos of the Byzantine writers, owes a good deal of its importance to its strategical position on one of the trans Balkan highways to Adrianople and the south. In early times, when it was a subject of dispute between Byzantium and Bulgaria, it generally followed the fate of Aidos and Mesembria (Misivri). After its capture by the Turks (1388) it was one of the "voinik" towns which remained exempt from taxes and were allowed to elect their own voivode, but those privileges were lost in the 16th century. On 12th August 1829 Sliven was occupied by the Russian army under Rudiger and Gortchakoff.

SLOANE, Sir Hans (1660-1753), a celebrated collector and successful physician, was born on 16th April 1660 at Killileagh in county Down, Ireland, where his father had settled at the head of a Scotch colony sent over by James I. He had as a youth a strong turn for collecting objects of natural history and other curiosities. This led him to the study of medicine, which he went to London to pursue, directing his attention assiduously to botany, materia medica, and pharmacy. His collecting propensities made him useful to the more philosophically minded Ray and Boyle, and procured him their patronage. After four years in London he travelled through France, spending some time at Paris and Montpellier, and taking his M.D. degree at the university of Orange. He returned to London with a considerable collection of plants and other curiosities, of which the former were sent to Ray and utilized by him for his *History of Plants*. Sloane was quickly elected into the Royal Society, and at the same time he had the good fortune to attract the notice of Sydenham, who took a fancy to him and gave him valuable introductions to practice. In 1687 he became fellow of the College of Physicians, and took the opportunity of proceeding to Jamaica the same year as physician in the suite of the duke of Albemarle. The duke died soon after landing, and Sloane's visit lasted only fifteen months; but during that time he got together about 800 new species of plants, the island being at the time virgin ground to the botanist. Of these he published an elaborate catalogue in Latin, and at a later date (1707-25) he made the experiences of his visit the subject of two sumptuous folio volumes. His merits as a collector were sufficient to give him a high place in the scientific circles of the time. He became secretary to the Royal Society in 1693, and edited its *Transactions* for twenty years. His practice as a physician among the upper classes was large and lucrative; he is said to have inspired the members of the court and aristocracy with the "greatest confidence in his prescriptions." In the pamphlets written concerning Dr Cockburn's sale of a secret remedy for dysentery and other fluxes, it was stated for the defence that Sloane himself did not disdain the same kind of professional conduct; and there is some colour given to that charge by the fact that his only medical piece, an *Account of a Medicine for Soreness, Weakness, and other Distempers of the Eyes* (London, 1745) was not given to the world until its author was in his eighty-fifth year, and had retired from practice.

On the accession of George I. Sloane was made physician-general to the army, and in 1716 was created a baronet, being the first medical practitioner to receive an hereditary title. In 1719 he became president of the College of Physicians, and held the office sixteen years. In 1727 he succeeded Sir Isaac Newton in the presidential chair of the Royal Society; he retired from it at the age of eighty, "much against the inclination of that respectable body, who chose Martin Folkes to succeed him, and in a public assembly thanked him for the great and eminent services which he had rendered them." Sloane's memory survives more by his judicious investments than by anything that he contributed to the subject-matter of natural science or even of his own profession; his name is absolutely unknown in the history of medicine, and his services to botany were such as, in the nature of things, would be soon forgotten. But his purchase of the manor of Chelsea has perpetuated his memory in the name of a "place," a street, and a square. His great stroke as a collector was to acquire (by bequest, conditional on paying off certain debts) in 1701 the cabinet of William Courten, who had made collecting the business of his life. When Sloane retired from active work in 1741 his library and cabinet of curiosities, which he took with him from Bloomsbury to his house in Chelsea, had grown to be very extensive and of unique value. On his death on 11th January 1753 he bequeathed his books, manuscripts, prints, drawings, pictures, medals, coins, seals, cameos, and other curiosities to the nation, on condition that parliament should pay to his executors £20,000, which was a good deal less than the value of the collection. The bequest was accepted on those terms by an Act passed the same year, and the collection, together with George II.'s royal library, &c., was opened to the public at Bloomsbury as the British Museum in 1759. Among his other acts of benevolence or munificence may be mentioned his gift to the Apothecaries' Company of the freehold of the botanical or physic garden, which they had rented from the Chelsea estate since 1673, also his help in starting the foundling hospital. Sloane is described as having been a man of considerable presence and of courtly address.

See Weld, *History of the Royal Society*, i. 450 (London, 1848); and Munk, *Roll of the College of Physicians*, 2d ed., i. 466 (London, 1878).

SLODTZ, René Michel or Michel Ange (1715-1764), French sculptor, was born at Paris on 29th September

1715. He passed seventeen years of his life at Rome, where he was chosen to execute a statue of St Bruno, one of the best modern works of the class in St Peter's. He was also the sculptor of the tomb of Marquis Capponi in St John of the Florentines. Other works of his are to be seen at the church of St Louis of France and at Santa Maria della Scala. After his return to France, Slodtz, in conjunction with his brothers Sebastian and Paul, produced many decorative works in the churches of Paris, and, though much has been destroyed, his most considerable achievement—the tomb of Languet de Gergy in St Sulpice—exists at the present day. He died at Paris on 26th October 1764.

Slodtz had been, like his brothers, a member of the Academy of Painting and Sculpture, and many particulars of his life are preserved in a memoir written by Cochin, and also in a letter from the same to the *Gazette Littéraire*, which was reproduced by Castilhon in the *Nécrologe* of 1766. Slodtz's father (1655-1726) was also a sculptor, born at Antwerp; he became a pupil of Girardon and worked mostly under him at Versailles and the Tuileries.

See C. N. Cochin, *Mém. inéd.*, Paris, 1881; Barbet de Jouy, *Sculpture moderne du Louvre*, Paris, 1856; Dussieux, *Artistes Français à l'Étranger*, Paris, 1852.

SŁONIM, a district town of Russia, in the government of Grodno, 105 miles south-east of Grodno and 20 from the railway from Moscow to Warsaw, on the high craggy banks of the Schara. It derives its importance from this river, which is navigable and enters the system of the Oginski Canal connecting the Niemen with the Dnieper. Corn, tar, and especially timber are exported annually to a large amount, which in 1882 reached the value of £20,700. The population was 21,110 in 1883.

Słonim is a very old town, being mentioned in 1040, when Yaroslaff defeated the Lithuanians in its neighbourhood and compelled them to acknowledge his rule. In 1241 the Mongols, under Batyi, pillaged it and burned its wooden fort. Owing to its position between Galician Russia and Lithuania, it often changed hands until it was conquered by the Lithuanians in the 14th century. From 1631 to 1685 it was the seat of the Lithuanian *seim* and became a flourishing city. In the 18th century, under the hetman Oginski, a canal was dug to connect the Schara with the Dnieper. Oginski embellished the city and founded there a printing-office. Russia annexed the town in 1795.

SLOTH. The general characters by which the family *Bradypodidæ* are distinguished from the rest of the order *Edentata* have been given in the article MAMMALIA (vol. xv. p. 384). The sloths, as the animals of this family are called on account of the habitual sluggishness of their

Two-toed sloth (*Cholœpus hoffmanni*).

movements, are the most strictly arboreal of all mammals, living entirely among the branches of trees, usually hanging under them, with their backs downwards, and clinging to them with the simple hook-like organs to which the terminations of all their limbs are reduced. When they are obliged from any cause to descend to the ground, which they rarely, if ever, do voluntarily, their limbs, owing to their unequal length and the peculiar conformation of the feet—which allows the animals to rest only on the outer edge—are most inefficient for terrestrial progression, and the sloths crawl along a level surface with considerable difficulty. Though generally slow and inactive, even when in their natural haunts, they can on occasions travel with considerable rapidity along the branches, and, as they do not leap, like most other arboreal creatures, they avail themselves of the swaying of the boughs by the wind to pass from tree to tree. They feed entirely on leaves and young shoots and fruits, which they gather in their mouth, the fore-limbs aiding in dragging boughs within reach, but not being used as hands, as they are by monkeys, squirrels, &c. When sleeping they roll themselves up in a ball, and, owing to the dry shaggy character of their hair, are very inconspicuous among the mosses and lichens with which the trees of their native forests abound; and the concealment thus afforded is heightened in some species by the peculiar greenish tint of the outer covering,—very uncommon in mammals. This is not due to the colour of the hair itself, but to the presence upon its surface of an alga, the lodgement of which is facilitated by the fluted or rough surface of the exterior of the hair, and the growth of which is promoted by the dampness of the atmosphere in the gloomy tropical forests, as it soon disappears from the hair of animals kept in captivity in England. Sloths are nocturnal, silent, inoffensive, and solitary animals, and produce usually but one young at birth. They appear to show an almost reptilian tenacity of life, surviving the most severe injuries and large doses of poisons, and exhibiting longer persistence of irritability of muscular tissue after death than other mammals.

The sloths were all included in the Linnean genus *Bradypus*, but Illiger very properly separated the species with but two claws on the fore-feet, under the name of *Cholœpus*, leaving *Bradypus* for those with three.

Genus *Bradypus*.—Three-toed sloths. Teeth usually $\frac{5}{4}$ on each side; no tooth projecting greatly beyond the others; the first in the upper jaw much smaller than any of the others; the first in the lower jaw broad and compressed; the grinding surfaces of all much cupped. Vertebræ: C 9, D and L 20 (of which 15 to 17 bear ribs), S 6, C 11. All the known species present the remarkable peculiarity of possessing nine cervical vertebræ, *i.e.*, nine vertebræ in front of the one which bears the first thoracic rib (or first rib connected with the sternum, and corresponding in its general relations with the first rib of other mammals); but the ninth, and sometimes the eighth, bears a pair of short movable ribs. ~~The arms or fore~~-limbs are considerably longer than the hind legs. The bones of the fore-arm are complete, free, and capable of pronation and supination. The hand is long, very narrow, habitually curved, and terminates in three pointed curved claws, in close apposition with each other; they are, in fact, incapable of being divaricated, so that the hand is reduced to the condition of a triple hook, fit only for the function of suspension from the boughs of trees. The foot closely resembles the hand in its general structure and mode of use. The sole is habitually turned inwards and cannot be applied to the ground in walking. The tongue is short and soft, and the stomach large and complex, bearing some resemblance to that of the ruminating animals. The windpipe or trachea has the remarkable peculiarity among mammals—not unfrequent among birds and reptiles—of being folded on itself before it reaches the lungs. The mammæ are two and pectoral in position.

"Ai" is the common name given in books to the three-toed sloths. They were all comprised by Linnæus under the species *Bradypus tridactylus*. More recently Dr Gray has described as many as eleven, ranged in two genera, *Bradypus* and *Arctopithecus*; but the distinctions which he assigns both to species and to genera do not bear close examination. Some are covered uniformly with a grey or greyish brown coat; others have a dark collar of elongated hairs around the shoulders (*B. torquatus*); some have the hair of the face very much shorter than that of the rest of the head and neck; and others have a remarkable-looking patch of soft short hair on the back between the shoulders, consisting when best marked of a median stripe of glossy black, bordered on each side by bright

orange, yellow, or white. There are also structural differences in the skulls, as in the amount of inflation of the pterygoid bones, which indicate real differences of species; but the materials in our museums are not yet sufficient to correlate these with external characters and geographical distribution. The habits of all are apparently alike. They are natives of Guiana, Brazil, and Peru, and one if not two species (*B. infuscatus* and *B. castaneiceps*) extend north of the Isthmus of Panama as far as Nicaragua. Of the former of these Dr Seeman says that, though generally silent, a specimen in captivity uttered a shrill sound like a monkey when forcibly pulled away from the tree to which it was holding.[1]

Genus *Cholœpus*.—Teeth $\frac{5}{4}$, the most anterior in both jaws separated by an interval from the others, very large, caniniform, wearing to a sharp, bevelled edge against the opposing tooth, the upper shutting in front of the lower when the mouth is closed, unlike the true canines of heterodont mammals. Vertebræ: C 6 or 7, D 23-24, L 3, S 7-8, C 4-6. One species (*C. didactylus*) has the ordinary number of vertebræ in the neck, but an otherwise closely allied form (*C. hoffmanni*) has but six. The tail is very rudimentary. The hand generally resembles that of *Bradypus*, but there are only two functional digits, with claws,—those answering to the second and third of the typical pentadactyle manus. The structure of the hind limb generally resembles that of *Bradypus*, the appellation "two-toed" referring only to the anterior limb, for in the foot the three middle toes are functionally developed and of nearly equal size. *C. didactylus*, which has been longest known, is commonly called by the native name of *Unau*. It inhabits the forests of Brazil. *C. hoffmanni* has a more northern geographical range, extending from Ecuador through Panama to Costa Rica. Its voice, which is seldom heard, is like the bleat of a sheep, and if the animal is seized it snorts violently. Both species are very variable in external coloration. (W. H. F.)

SLOUGH, an urban sanitary district of Buckinghamshire, England, is situated on the Great Western Railway, 18½ miles west of London and 2 north of Windsor. Within recent years it has largely increased, and it contains a number of good shops and villas. It is supplied with water from artesian wells. The parish church of St Mary, erected 1837, has been recently enlarged. Among other public buildings are the British orphan asylum, the Eton union workhouse, and the reading-room and literary institute. Sir William Herschel, the astronomer, resided at Slough, and there constructed his telescope. The population of the urban sanitary district, which embraces parts of the parishes of Stoke Poges and Upton-cum-Chalvey, in 1871 was 4509, and in 1881 (area, 401 acres) it was 5095.

SLOVENES. See SLAVS.

SLUG. See SNAIL.

SŁUTSK, a district town of Russia, in the government of Minsk, situated on the Słutcha river (tributary of the Pripet), 123 miles south of Minsk. This old town is mentioned in the 12th century as a dependency of Kieff, and, like other towns of the region, was devastated by the Tatars, and later suffered in the wars between Russia and Poland. It is now merely a large village, whose inhabitants are chiefly engaged in agriculture, with a little trade in corn, timber, and wooden wares. The immense marshy and woody tracts of the Polyesie (see MINSK) surround it on all sides, the Słutcha being its chief means of communication. Its population remains almost stationary and was 19,000 in 1883.

SMALLPOX, or VARIOLA (*varius*, "a pimple"), an acute infectious disease characterized by fever and by the appearance on the surface of the body of an eruption, which, after passing through various stages, dries up, leaving more or less distinct cicatrices. Few diseases have been so destructive to human life as smallpox, and it has ever been regarded with horror alike from its fatality, its loathsome accompaniments and disfiguring effects, and from the fact that no age and condition of life are exempt from liability to its occurrence. Although in most civilized countries its ravages have been greatly limited by the protection afforded by vaccination, yet epidemic outbreaks are far from uncommon, affecting especially those who are unprotected, or whose protection has become weakened by lapse of time.

Much obscurity surrounds the early history of smallpox. It appears to have been imported into Europe from Asia, where it had been known and recognized from remote antiquity. The earliest accounts of its existence reach back to the middle and end of the 6th century, when it was described by Procopius and Gregory of Tours as occurring in epidemic form in Arabia, Egypt, and the south of Europe. In one of the narratives of the expedition of the Abyssinians against Mecca (c. 550) the usual miraculous details are combined with a notice of smallpox breaking out among the invaders.[2] Not a few authorities, however, regard these accounts as referring not to smallpox but to plague. The most reliable statements as to the early existence of the disease are found in Rhazes (see vol. xv. p. 805), by whom its symptoms were clearly described, its pathology explained by a humoral or fermentation theory, and directions given for its treatment. During the period of the crusades smallpox appears to have spread extensively through Europe, and hospitals for its treatment were erected in many countries. But at this period and for centuries afterwards the references to the subject include in all likelihood other diseases, since no precise distinction appears to have been made between the different forms of eruptive fever until a comparatively recent date. Smallpox was known in England as early as the 13th century, and had probably existed there before. It appears to have been introduced into America shortly after the discovery of that continent, and there, as in Europe and throughout the known world, destructive epidemics were of frequent occurrence during succeeding centuries.

The only known factor in the origin of smallpox is contagion,—this malady being probably the most contagious of all diseases. Its outbreak in epidemic form in a locality may frequently be traced to the introduction of a single case from a distance. The most direct means of communicating smallpox is inoculation (see below). By far the most common cause of conveyance of the disease, however, is contact with the persons or the immediate surroundings of those already affected. The atmosphere around a smallpox patient is charged with the products of the disease, which likewise cling tenaciously to clothing, furniture, &c. The disease is probably communicable from its earliest manifestations onwards to its close, but it is generally held that the most infectious period extends from the appearance of the eruption till the drying up of the pustules. Smallpox may also readily be communicated by the bodies of those who have died from its effects. No age is exempt from susceptibility to smallpox. Infants are occasionally born with the eruption or its marks upon their bodies, proving that they had undergone the disease *in utero*. Dark-skinned races are said to suffer more readily and severely than whites. One attack of smallpox as a rule confers immunity from any recurrence, but there are numerous exceptions to this rule. Overcrowding and all insanitary surroundings favour the spread of smallpox where it has broken out; but the most influential condition of all is the amount of protection afforded to a community by previous attacks and, especially in the present day, by vaccination. Such protection, although for a time most effectual, tends to become exhausted, unless renewed. Hence in a large population there is always likely to be an increasing number of individuals who have become susceptible to smallpox. This probably explains its occasional and even apparently

Contagion.

[1] Godman and Salvin's *Biologia Centrali Americana*, p. 184.

[2] See Noldeke, *Geschichte der Perser ... aus Tabari* (Leyden, 1879), p. 218. Noldeke thinks that this notice may be taken from genuine historical tradition, and seems to find an allusion to it in an old poem.

periodic epidemic outbreaks in large centres, and the well-known fact that the most severe cases occur at the commencement,—those least protected being necessarily more liable to be first and most seriously attacked.

Symptoms. While the symptoms of smallpox are essentially the same in character in all cases, they are variously modified according to the form which the disease may assume, there being certain well-marked varieties of this as of most other infectious maladies. The following description applies to an average case. After the reception into the system of the smallpox contagion the onset of the symptoms is preceded by a period of incubation, during which the patient may or may not complain. This period is believed to be from about ten to fourteen days. In cases of direct inoculation of the virus it is considerably shorter. The invasion of the symptoms is sudden and severe, in the form of a rigor followed by fever (the *primary fever*), in which the temperature rises to 103° or 104° Fahr. or higher, notwithstanding that perspiration may be going on. A quick pulse is present, together with thirst and constipation, while intense headache accompanied with vomiting and pain in the back is among the most characteristic of the initial symptoms. Occasionally the disease is ushered in by convulsions. Some authorities hold that the more violent the invasion the more severe the attack is likely to prove. These symptoms continue with greater or less intensity throughout two entire days, and during their course there may occasionally be noticed on various parts of the body, especially on the lower part of the abdomen and inner sides of the thighs, a diffuse redness accompanied by slight spots of extravasation (*petechiæ*), the appearance somewhat resembling that of scarlet fever. These "prodromal rashes," as they are termed, appear to be more frequent in some epidemics than in others, and they do not seem to have any special significance. They are probably more frequently seen in cases of the mildest form of smallpox (varioloid), referred to below. On the third day the characteristic eruption begins to make its appearance. It is almost always first seen on the face, particularly about the forehead and roots of the hair, in the form of a general redness; but upon this surface there may be felt by the finger numerous elevated points more or less thickly set together. The eruption, which is accompanied by heat and itching, spreads over the face, trunk, and extremities in the course of a few hours,—continuing, however, to come out more abundantly for one or two days. It is always most marked on the exposed parts; but in such a case as that now described the individual "pocks" are separated from each other (discrete). On the second or third day after its appearance the eruption undergoes a change,—the pocks becoming vesicles filled with a clear fluid. These vesicles attain to about the size of a pea, and in their centre there is a slight depression, giving the characteristic umbilicated appearance to the pock. The clear contents of these vesicles gradually become turbid, and by the eighth or ninth day they are changed into pustules containing yellow matter, while at the same time they increase still further in size and lose the central depression. Accompanying this change there are great surrounding inflammation and swelling of the skin, which, where the eruption is thickly set, produce much disfigurement and render the features unrecognizable, while the affected parts emit an offensive odour, particularly if, as often happens, the pustules break. The eruption is present not only on the skin but on mucous membranes, that of the mouth and throat being affected at an early period; and the swelling produced here is not only a source of great discomfort but even of danger from the obstruction thus occasioned in the upper portion of the air-passages. The voice is hoarse and a copious flow of saliva comes from the mouth. The mucous membrane of the nostrils is similarly affected, while that of the eyes may also be involved, to the danger of permanent impairment of sight. The febrile symptoms which ushered in the disease undergo marked abatement on the appearance of the eruption on the third day, but on the eighth or ninth, when the vesicles become converted into pustules, there is a return of the fever (*secondary* or *suppurative fever*), often to a severe extent, and not unfrequently accompanied by prominent nervous phenomena, such as great restlessness, delirium, or coma. On the eleventh or twelfth day the pustules show signs of drying up (desiccation), and along with this the febrile symptoms decline. Great itching of the skin attends this stage. The scabs produced by the dried pustules gradually fall off and a reddish brown spot remains, which, according to the depth of skin involved in the disease, leaves a permanent white depressed scar,—this "pitting" so characteristic of smallpox being specially marked on the face. Convalescence in this form of the disease is as a rule uninterrupted.

Varieties. There are certain varieties of smallpox depending upon the form it assumes or the intensity of the symptoms. *Confluent smallpox* (*variola confluens*), while essentially the same in its general characters as the form already described, differs from it in the much greater severity of all the symptoms even from the onset, and particularly in regard to the eruption, which, instead of showing itself in isolated pocks, appears in large patches run together, giving a blistered aspect to the affected skin. This confluent condition is almost entirely confined to the face, and produces shocking disfigurement, while subsequently deep scars remain and the hair may be lost. The mucous membranes suffer in a similar degree of severity, and dangerous complications may arise from the presence of the disease in the mouth, throat, and eyes. Both the primary and secondary fevers are extremely severe. The mortality is very high, and it is generally estimated that at least 50 per cent. of such cases prove fatal, either from the violence of the disease or from one or other of the numerous complications which are specially apt to attend upon it. Convalescence is apt to be slow and interrupted. Another variety is that in which the eruption assumes the *hæmorrhagic* form owing to bleeding taking place into the pocks after their formation. This is apt to be accompanied with hæmorrhages from various mucous surfaces (particularly in the case of females), occasionally to a dangerous degree and with symptoms of great prostration. Many of such cases prove fatal. A still more serious form is that termed *malignant smallpox*, in which, as in the malignant forms of other infectious diseases (see MEASLES and SCARLET FEVER), the patient is from the onset overwhelmed with the poison and quickly succumbs,—the rash scarcely, if at all, appearing or showing the hæmorrhagic or purpuric character. Such cases are, however, comparatively rare. The term *varioloid* or *modified smallpox* is applied to cases occurring in persons constitutionally but little susceptible to the disease, or in whom the protective influence of vaccination or a previous attack of smallpox still to some extent exists. Cases of this mild kind are of very common occurrence where vaccination has been systematically carried out. As compared with an average case of the unmodified disease as above described, this form is very marked, the differences extending to all the phenomena of the disease. (1) As regards its onset, the initial fever is much milder and the premonitory symptoms altogether less in severity. (2) As regards the eruption, the number of pocks is smaller, often only a few and mostly upon the body. They not unfrequently abort before reaching the stage of suppuration; but should they proceed to this stage the secondary fever is extremely slight or even

absent There is little or no pitting (3) As regards complications and injurious results, these are rarely seen and the risk to life is insignificant

Attendant circumstances

Various circumstances affect the mortality in ordinary smallpox and increase the dangers attendant upon it The character of the epidemic has an important influence In some outbreaks the type of the disease is much more severe than in others, and the mortality consequently greater Smallpox is most fatal at the extremes of life, except in the case of vaccinated infants, in whom there is immunity from the disease Again, any ordinary case with discrete eruption is serious, and a case of confluent or even semi-confluent character is much more grave, while the hæmorrhagic variety is frequently and the malignant always fatal Numerous and often dangerous complications, although liable to arise in all cases, are more apt to occur in the severer forms, and in general at or after the supervention of the secondary fever The most important are inflammatory affections of the respiratory organs, such as bronchitis, pleurisy, or pneumonia, diphtheritic conditions of the throat, and swelling of the mucous membrane of the larynx and trachea Destructive ulceration affecting the eyes or ears are well-known and formidable dangers, while various affections of the skin, in the form of erysipelas, abscess, or carbuncles, are of not infrequent occurrence Persons of enfeebled health, and those whose constitutions are impaired by intemperance, readily succumb to attacks of smallpox, even of comparatively mild character, as do also pregnant women, to whom this disease is peculiarly dangerous

Vaccination

The most important of all the conditions tending to affect the mortality from smallpox, alike in the individual and the community, is the protection afforded by VACCINATION (*q v*) During the first decade of life, if vaccination has been fully and successfully accomplished in infancy, the risk of death from smallpox is *nil*, but, should the disease be caught—which is improbable—it will in all likelihood show itself in the mild form of varioloid As regards revaccination, it has been found in all smallpox hospitals that the attendants and nurses escape the disease when revaccinated In the experience of the late Dr Waller Lewis in the case of an average of 10,504 persons permanently employed in the General Post Office, London, all of whom had to be revaccinated on admission, it was proved that in the ten years 1870-79 not a single fatal case of smallpox occurred, and only ten mild cases were seen during a period embracing two epidemics

Treatment

Treatment—The treatment of smallpox is conducted upon the same general principles as that for the other infectious diseases (see CHOLERA, DIPHTHERIA, MEASLES, SCARLET FEVER) The establishment of smallpox hospitals separated as far as possible from populous localities, and the prompt removal of cases of the disease where practicable, as well as the diligent prosecution of vaccination and revaccination, are among the first requirements The plan introduced into several large towns of compulsory notification of infectious diseases has much to recommend it The special treatment applicable to a person suffering from smallpox includes in the first place the providing competent nurses, who, together with all others in the neighbourhood of the patient, should be duly protected by recent vaccination The patient should lie on a soft bed in a well-ventilated but somewhat darkened room and be fed with the lighter forms of nutriment, such as milk, soups, &c The skin should be sponged occasionally with tepid water, and the mouth and throat washed with a solution of chlorate of potash, Condy's fluid, or other safe disinfectant In a severe case, with evidence of much prostration, stimulants may be advantageously employed The patient should be always carefully watched, and special vigilance is called for where delirium exists This symptom may sometimes be lessened by sedatives, such as opium, the bromides, or chloral With the view of preventing pitting many applications have been proposed, but probably the best are cold or tepid compresses of light weight kept constantly applied over the face and eyes The water out of which these are wrung may be a weak solution of carbolic or boracic acid When the pustules have dried up the itching this produces may be much relieved by the application of oil or vaseline Complications are to be dealt with as they arise and the severer forms of the disease treated in reference to the special symptoms presented In cases where the eruption is tardy of appearing and the attack threatens to assume the malignant form, the writer has seen marked benefit attend the use of the wet pack Disinfectants should be abundantly employed in the room and its vicinity, and all clothing, &c, in contact with the patient should be burnt

Inoculation

Inoculation—Previous to the introduction of vaccination the method of preventive treatment by what was known as inoculation had been employed This consisted in introducing into the system—in a similar way to the method now commonly employed in vaccination—the smallpox virus from a mild case with the view of reproducing the disease also in a mild form in the person inoculated, and thus affording him protection from further attack This plan had apparently been resorted to by Eastern nations from an early period in the history of the disease It was known to be extensively practised in Turkey in the beginning of the 18th century, when, chiefly through the letters of Lady Mary Wortley Montagu, it became known and was speedily adopted in England There is no doubt, both from the statistics of the Smallpox and Inoculation Hospital, London, and from the testimony of physicians throughout the country, that this practice made a marked impression upon the fatality of the disease, and was itself attended with extremely little risk to life The objections to it, however, were great, for, although usually conveying the smallpox in a mild form, it not unfrequently took effect severely, and, while death might be averted, the disfiguring results of the disease remained Further, each inoculated person upon whom the operation took effect became for the time being a possible source of infection to others, and in point of fact the practice tended to spread the disease and so to increase the general mortality Although inoculation continued to be practised for a number of years subsequently to Jenner's great discovery, it gradually became displaced by that vastly superior and safer preventive In 1840 an Act of Parliament was passed rendering smallpox inoculation unlawful in England (J O A)

SMART, CHRISTOPHER (1722-1771), English poet, was born at Shipbourne in Kent on 11th April 1722 The discovery that Smart was anything more than an unfortunate Bohemian of letters who wrote much uninteresting verse of second-rate 18th-century quality is quite recent After one or another of his superseded translations or ineffective exercises in heroics had in turn been assigned the place of honour as his representative literary work, his real masterpiece was discerned in a poem which, except for a reprint issued in 1819, had been singularly overlooked, and even omitted from the collected editions of his poetry The history of this poem, *A Song to David*, is somewhat remarkable It was written in the saner moments of confinement for a fit of insanity, and was, it is said, on not unimpeachable authority perhaps, indented with an iron nail or a key on the wall of the cell in default of other means of writing The real facts of the case would seem to be that the unfortunate poet inscribed one or two stanzas in the manner asserted, and that he either dictated or was given the materials wherewith to write the rest of the poem

There is no internal evidence of any morbid origin, however, for the poem is full of a healthy and virile energy. As a boy he was delicate and precocious, with a facile gift of verse, which already won him a certain notoriety, of not the best effect haply, at Durham school, whither he had been sent on leaving a preparatory school at Maidstone. During a holiday visit to Raby castle his boyish gifts attracted the interest of the duchess of Cleveland, who made him an allowance of £40 a year, which was continued until her death, and which possibly served further to weaken his self-reliance. At Cambridge, where he was entered at Pembroke Hall in 1739, he led a rather dissipated life, getting heavily into debt, and, while he easily excelled in certain congenial branches of study, he paid little attention to the usual college routine. In spite of his irregularities, he was made a fellow of his college in 1745, and at a later date won the newly instituted Seaton prize for an English poem,—the subject each year being one of "the attributes of the Supreme Being." Smart gained this prize five times in all. Resorting then to London and marrying there a daughter-in-law of Newbery, the publisher, the poet attempted to make a living by literary hack-work and journalism, but sank gradually into difficulties through his improvident and dissipated habits, so that his wife and children were at last obliged to leave him. His misfortunes seem to have culminated in the fit of insanity associated with *A Song to David*, which was published in 1763, and in 1771 Smart died from the effects of poverty and disease.

Amid all his miseries Smart must have been fairly industrious if his journalistic work was at all proportionate to his more substantial literary productions. Of all that he wrote, however, *A Song to David* will alone bear the test of time. Unlike in its simple forceful treatment and impressive directness of expression, as has been said, to anything else in 18th-century poetry, the poem on analysis is found to depend for its unique effect also upon a certain ingenuity of construction, and the novel way in which David's ideal qualities are enlarged upon. This will be more readily understood on reference to the following verse, the first twelve words of which become in turn the key-notes, so to speak, of the twelve succeeding verses:—

> "Great, valiant, pious, good, and clean,
> Sublime, contemplative, serene,
> Strong, constant, pleasant, wise!
> Bright effluence of exceeding grace;
> Best man!—the swiftness, and the race,
> The peril, and the prize."

The last line is characteristic of another peculiarity in *A Song to David*, the effective use of alliteration to complete the initial energy of the stanza in many instances. But in the poem throughout is revealed a poetic quality which eludes critical analysis and gives its writer an exceptional interest hardly maintained by his other works.

A Song to David is found in somewhat shortened form in Ward's *English Poets*, vol. ii.; and Smart's other poems are given in Anderson's *British Poets* (1794), vol. xi., which contains also a full account of his life.

SMEATON, JOHN (1724-1792), English civil engineer, the son of an attorney, was born at Austhorpe Lodge, near Leeds, on 8th June 1724. He received a good education at the grammar-school of Leeds, displaying special proficiency in geometry and arithmetic. At a very early age he evinced a great liking for the use of mechanical tools, and in his fourteenth or fifteenth year contrived to make a turning-lathe. On leaving school in his sixteenth year he was employed in his father's office, but, after attending for some months in 1742 the courts at Westminster Hall, he earnestly requested to be allowed to follow some mechanical profession. He became apprentice to a philosophical instrument maker, and in 1750 set up in business on his own account. Besides improving various mathematical instruments used in navigation and astronomy, he carried on several experiments in regard to other mechanical appliances, amongst the most important being a series on which he founded a paper—for which he received the Copley medal of the Royal Society in 1759—entitled *An Experimental Inquiry concerning the Native Powers of Water and Wind to turn Mills and other Machines depending on a Circular Motion*. In 1754 he made a tour of the Low Countries to study the great canal works of foreign engineers. Already by his papers read before the Royal Society and his intercourse with scientific men his abilities as an engineer had become well known, and in 1756 application was made to him to reconstruct the Eddystone lighthouse, which had been burnt down in December of the previous year (see LIGHTHOUSE, vol. xiv. p. 616). Smeaton now began to be much consulted in regard to all kinds of important engineering projects, including river navigation, the drainage of fens, the designing of harbours, and the repair and construction of bridges, owing to the thorough engineering skill he displayed in every operation he undertook. In judging of his achievements it ought to be remembered that he was the precursor of the great modern engineers. James Watt said of him, "His example and precepts have made us all engineers." He combined in a remarkable degree theoretical with practical skill, much of his success being due to the fact that, as Stevenson states, "he was an incessant experimenter." A considerable portion of his time was also devoted to astronomical studies and observations, on which he read various papers before the Royal Society. In order to prepare an account of the various works on which he had been engaged as an engineer, Smeaton resolved to retire from his profession, but he only lived to complete in 1791 his *Narrative of the Building of Eddystone Lighthouse*. He died at Austhorpe, 28th October 1792, and was buried in the old parish church of Whitkirk.

See *A Short Narrative of the Genius, Life, and Works of the late Mr John Smeaton*, 1793; and Smiles, *Lives of the Engineers*.

SMELL is a sensation excited by the contact with the olfactory region of certain substances, usually in a gaseous condition and necessarily in a state of fine subdivision. The sense is widely distributed throughout the animal kingdom. The lower animals, especially those breathing in water, become cognizant of the presence of odoriferous matter near them without touch, vision, or hearing, and we suppose that they do so by some sense of taste or smell, or a combination of both. In such cases smell has been appropriately termed "taste at a distance," by which is meant that particles of matter may be diffused through the water so as to come into contact with the terminal organ and give rise to a sensation such as would have been excited had the matter from which the particles emanated come directly into contact with the nerve-endings. It is therefore of no great importance whether such sensations in humble aquatic organisms are termed taste or smell. In the higher air-breathing animals, however, the senses are differentiated: that of taste is found at the entrance of the alimentary canal, whilst that of smell guards the opening of the respiratory tract. This view assists in the interpretation of various structures met with in the lower forms which have been fairly regarded by naturalists as olfactory organs.

Comparative View of Olfactory Organs.—In various *Medusæ* pit-like depressions, lined with ciliated epithelium, on the dorsal side of the excavation in which the "marginal" bodies are found, have been called olfactory regions. In many *Arthropoda* the sense of smell is located in delicate tubular structures, or conical projections, found on the antennæ and connected with nerves. Similar organs are met with in *Crustacea*. In *Cyclops* (*Copepoda*), *Isopoda*, and *Thoracostraca* olfactory hairs are present as delicate appendages of the anterior antennæ, chiefly in the male sex. In *Schizopoda* the anterior antennæ have a comb-like prominence bearing a great number of olfactory hairs. *Insecta* have olfactory organs largely developed, usually in the form of hairs, cones, or knobs on the antennæ, and connected with gangliated nerve endings. Olfactory organs are also met with in *Mollusca*: in *Lamellibranchiata* they appear as hairs on the margin of the mantle; in aquatic *Gasteropoda* as tufts of hairs scattered over the surface of the body and specially aggregated in those parts where

tactile sensibility is highly developed; in terrestrial *Gasteropoda* the antennæ have on their end plates a number of club-shaped cells with rods, which are held to be olfactory, and recently in the same class Sprengel has shown that an organ "which was supposed to be a rudimentary gill, and is innervated from the supra-intestinal ganglion," has an olfactory function. In *Ascidians* the olfactory region is believed to be a depression on the wall of the pharynx, situated in front of the ganglion, and lined with ciliated epithelium.

In *Fishes* the olfactory organs consist of a membrane (the pituitary membrane) lining one or two pits, to which the olfactory or first pair of cranial nerves are distributed. This highly vascular membrane is usually thrown into numerous folds, so as to admit of an extensive surface being packed into small space, and it is covered by ciliated epithelium. In the lowest vertebrate, *Amphioxus*, the olfactory organ is a simple unsymmetrical pit at the anterior end of the nervous system. In the hag fishes (*Myxinidæ*) the olfactory pit has a posterior opening which pierces the palate and can be closed by a valvular apparatus. In the lampreys (*Petromyzon*) the flask-shaped nasal sac opens on the top of the head, and from this a tube descends which expands into a blind sac towards the base of the skull. In all other fishes the olfactory organs are double and have no communication with the mouth. In osseous fishes the olfactory capsules or sacs are covered with skin which is usually pierced by two openings for each sac. Some, such as the wrasses, have a single nasal opening, and where there are two the anterior can be closed by a valve. The olfactory region may be extensive owing to the pituitary membrane being thrown into plaits or folds, and it may be divided into two portions, one quite smooth and the other plicated. The smooth portion, probably acting as a reservoir, may be large, extending down to the palate, as in the mackerel, or to the back part of the palate, as in the wolf fish (Owen). The nasal cavities exist below the snout in sharks, near the angles of the mouth in the rays, and beneath the fore part of the head, behind the base of the rostrum, in the saw fish. In such fishes the olfactory organ is guarded by valves, containing cartilaginous plates moved by muscles, and we may therefore conclude with Owen "that these fishes scent as well as smell, *i.e.*, actively search for odoriferous impressions by rapidly changing the current of water through the olfactory sac."

The olfactory organs of *Amphibia* are always paired cavities, opening internally either anteriorly within the lips or further back, as in the batrachians and salamandrines. In the *Perennibranchiates* (Siren, Proteus, Axolotl) there are no outward signs of olfactory organs, and the thick upper lip must be raised to bring the plicated sac with its two remote orifices into view (Owen). In the *Tritonidæ* (newts) and *Salamandrinæ* (salamanders) the olfactory membrane is smooth and lines an oval bag having an external nostril, guarded by a valvular fold of skin, and a palatal opening. Frogs and toads (*Batrachia*) have also an external nostril with a flap of skin, and the palatal opening is wide and near the fore part of the mouth. The skulls of extinct saurians of marine habits (*Ichthyosaurus* and *Plesiosaurus*) show that the external nostrils opened near the orbits at a distance from the muzzle. In snakes (*Ophidia*) the external nostrils are double, and the internal nostril is single and in the median line. In water snakes the external orifices can be closed by valves.

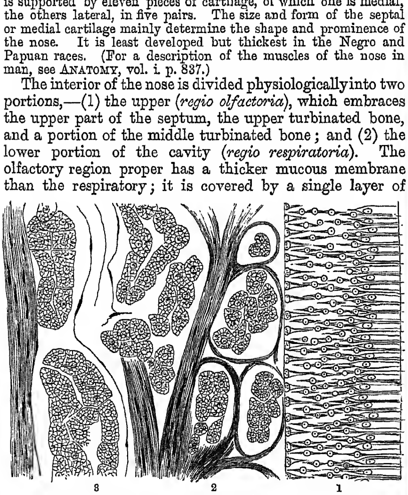
In *Chelonia* (turtles, tortoises) and in *Crocodilia* the external nasal opening is single and near the end of the snout, but in *Chelonia* the nostrils are really distinct, although their external apertures coincide. In the turtle the nasal cavity is large and contains a twisted shell-like cartilage, so as to give extent of surface to the darkly pigmented and highly vascular pituitary membrane. In the crocodiles and alligators the nostrils can be closed by a valvular lobe, and in the gavials (*Rhamphostoma gangeticum* and *Rhynchosuchus schlegelii*) the integument can be raised round the nostril in the form of a tube so as to bring the orifice to the surface of the water without exposing the other parts of the head (Owen). In all *Crocodilia* the nasal cavity is of great length, commencing at the fore part of the muzzle and ending beneath the occiput by a single aperture, and the surface of this long olfactory meatus is increased by the meatus communicating with large cells or sinuses. In snakes and lizards a second olfactory organ is found embedded between the turbinals and the vomer and is known as "Jacobson's organ." It has the form of a cup or depression round a cartilaginous papilla and is supplied by a nerve which arises from the end of the olfactory lobe.

The olfactory organs of *Birds* are somewhat similar to those of the cold-blooded reptiles and amphibians in that "the external nostrils are simple perforations, having no movable cartilages or muscles provided for dilating or contracting their apertures, as in mammalia" (Owen). The extent of the olfactory surface is increased by projections and folds of turbinated bones and not by large accessory cavities. With the exception of the apteryx and dinornis, the olfactory nerve passes out of the skull by a single foramen. The external nostrils are in the majority of birds placed at the sides of the upper mandible, but in some cases, as in the toucans, they are found at the base of the bill, and in the apteryx they open at the extremity of the long upper mandible. In herons the apertures are so small as scarcely to admit the point of a pin, and in the pelicans they are wanting, and odours get access to the olfactory organ from the palate. The *Rasores* (scratching birds) have the nostrils defended by a scale, and the crows (*Corvidæ*) have a bunch of stiff feathers for the same purpose. The septum or partition between the nostrils is usually complete and is formed of bone and cartilage. The outer wall of each nasal passage is furnished with three turbinal or twisted shell-like bones, of which the middle is the largest, thus affording a considerable extent of olfactory surface. In most birds there are two posterior nasal apertures communicating with the palate, but in some, as in the cormorant and gannet, the passages unite and there is only one opening. In birds the upper part of the nasal passage is more especially devoted to the sense of smell, whilst the lower part may be regarded as the beginning of the respiratory tract. This is indicated by the arrangement of the nerves, the olfactory nerve being distributed to the membrane covering the septum and the superior and middle turbinated bones, whilst the lower portion and lower turbinals are supplied by the fifth nerve,—a nerve of general sensibility. The upper turbinals reach their greatest development in the apteryx, where they are attached, according to Owen, to the whole outer part of the prefrontals. This bird has amongst birds the largest olfactory nerves in proportion to its size, and it would appear to be guided by the sense of smell to the worms that form its food. A contrast as regards the anatomical arrangements for the olfactory sense is well seen on comparing the turkey with the vulture. In the turkey the olfactory nerve is small, about one-fifth the size of that in the vulture, and is distributed over a small middle turbinal, there being no extension over a superior turbinal. The vulture, on the other hand, has a large nerve and the olfactory region is extensive, owing to the largely developed superior turbinal bone. There can be no doubt that the carrion-eating vulture is guided from great distances to its food by the sense of smell, although it will be assisted by its powerful sense of vision.

The sense of smell reaches its highest development in *Mammalia*. The anatomical surface is enormously extended in many cases, not only by the complication of the ethmoidal labyrinth, but also by the nasal passages communicating with spaces in the neighbouring cranial and facial bones. The olfactory nerves also are very numerous and arise from a special encephalic centre. They pass out of the skull by numerous holes in the cribriform or sieve-like plate of the prefrontal bone, which, on account of this peculiarity, is called the ethmoid bone. These nerves ramify on the olfactory membrane, covering the upper or ethmo-turbinal bones. The cavity containing the organ of smell is bounded by the prefrontal, vomerine, nasal, sphenoid, pterygoid, palatine, maxillary, and premaxillary bones, and it is usually in connexion with air-cavities or sinuses in many or all of the bones of the skull. The median partition by which the two nostrils are formed consists of bone and cartilage and is built up by processes of the prefrontals, the vomer, and by the ridges of the nasals, palatines, maxillaries, and premaxillaries with which the vomer articulates. Each passage thus formed is the beginning of the respiratory tract, and is continued forwards into a more or less mobile part called a nose, snout, or proboscis, whilst posteriorly it communicates with the upper part of the pharynx, into which opens the windpipe. On the outer wall there are three turbinal bones—superior, middle, and inferior—dividing partially the nasal cavity into three meatuses or passages. The superior meatus is between the superior and middle turbinated bones, the middle meatus between the middle and inferior turbinated bones, and the inferior meatus between the inferior turbinated bones and the floor of the nose (see ANATOMY, vol. i. p. 823, fig. 7; also vol. i. pl. XIX. fig. 2). Many of the lower mammals have in addition a process from the frontal and nasal bones, sometimes called the superior spongy bone, which is not the same as the superior turbinated, as described in the anatomy of the human being. The extent of olfactory surface is enormously increased by numerous plicæ or processes of bone which to a great extent mask the comparatively simple arrangement above described. In *Ornithorhynchus* there is a single olfactory nerve escaping through an aperture in the prefrontal bone; in *Echidna*, the other member of the *Monotremata*, there are numerous olfactory nerves and a large development of ethmo-turbinals. In many *Marsupials* the sense of smell is largely developed, and in some (*Osphranter*) the turbinated bones are so large as to cause a lateral bulging of the nasal cavity, forming a marked feature of the skull. In *Rodents* the ethmo-turbinals may be subdivided into lamellæ so as to increase the olfactory surface, such is the case in the common hare. In the porcupine the sinuses developed from the olfactory cavity are of large size, forming a spongy mass surrounding the cavity of the skull in which the anterior portion of the brain lies. In *Insectivora* the olfactory surface is very large. Thus in the mole the ethmo-turbinal has not fewer than eight lamellæ or plates and the external nose is developed into a snout capable of considerable movement. Such a snout is very large and mobile in the elephant shrews. Armadillos and ant-eaters (*Edentata*) have a strong sense of smell. Thus in *Dasypus* the nasal portion of the skull is about equal in

volume to all the rest, and in *Chlamydophorus* (dwarf armadillo) the frontals are raised "into a pair of domes" by sinuses in them communicating with the large olfactory cavity. In most armadillos the external nose is strengthened by small bones. The air sinuses in the sloth extend upwards into the frontals and downwards into the sphenoid bone. No *Cetaceans* have olfactory organs, except the baleen or whalebone whales, and thus are devoid of the sense of smell. In the manatee (*Sirenia*) the nasal openings are placed far forwards and have movable cartilages, and the bony walls of the nasal passages are not extensive in proportion to the size of the rest of the skull. The elephants (*Proboscidea*) have the part of the nasal cavity concerned in smell contracted and narrow, but the cavity is prolonged into the trunk, at the end of which are the nostrils; the nasal cavity communicates with sinuses permeating every bone of the cranium. The tapirs have a shorter but very mobile proboscis, and the development of the nasal passages is extensive. The horse has the power of dilating and contracting each nostril, and the cribriform plates transmit very numerous olfactory nerves from the olfactory bulbs, which are large in proportion to the size of the rest of the brain. The *Suidæ* (swine) have a large and complex olfactory region; the accessory sinuses or spaces attain a great development; the nose is prolonged and truncate, the cartilages forming a complete tube, which is a continuation of the bony nostrils, and these tubes open on a naked disk. In the ox and sheep the olfactory region is large, but not so large as in the horse. The external, glandular, and moist part of the nose is a linear tract running from the mid-furrow of the upper lip to the oblique nostril in the sheep, and this portion passes through many gradations in size, as seen in the roebuck, fallow-deer, red-deer, and the ox. The *Carnivora* have the ethmo-turbinal and maxillo-turbinal regions even more largely developed than in *Herbivora*, and the latter portion reaches its maximum in the seals, where "these turbinals seem to block up the entry of the nasal respiratory passages, and must warm the air in arctic latitudes as well as arrest every indication from the effluvia of alimentary substances or prey" (Owen). In *Quadrumana* the nasal chamber becomes shorter and gains in depth, but not proportionally. In the platyrhine monkeys the cartilage forming the septum becomes flattened anteriorly, pushing the nostrils outwards. In the catarrhines this flattening is much less, so that the nostrils are approximated. In both groups the nostrils are not terminal. In *Man* the chief characteristic is the prominence of the fore part of the chambers, with the nostrils on the lower surface, and the nose is supported by eleven pieces of cartilage, of which one is medial, the others lateral, in five pairs. The size and form of the septal or medial cartilage mainly determine the shape and prominence of the nose. It is least developed but thickest in the Negro and Papuan races. (For a description of the muscles of the nose in man, see ANATOMY, vol. i. p. 837.)

The interior of the nose is divided physiologically into two portions,—(1) the upper (*regio olfactoria*), which embraces the upper part of the septum, the upper turbinated bone, and a portion of the middle turbinated bone; and (2) the lower portion of the cavity (*regio respiratoria*). The olfactory region proper has a thicker mucous membrane than the respiratory; it is covered by a single layer of



Longitudinal section through the olfactory membrane of guinea-pig. ×about 400. 1, Olfactory epithelium on free surface; 2, plexus of olfactory nerve-fibres; 3, pouches of serous glands containing epithelial cells. From Klein's *Atlas of Histology*.

epithelial cells, often branched at their lower ends and containing a yellow or brownish red pigment; and it contains peculiar tubular glands named "Bowman's glands." The respiratory portion contains ordinary serous glands. In the olfactory region also are the terminal organs of smell. These are long narrow cells passing to the surface between the columnar epithelium covering the surface. (See ANATOMY, vol. i. p. 885, fig. 76.) The body of the cell is spindle-shaped and it sends up to the surface a delicate rod-like filament, whilst the deeper part is continuous with varicose nerve-filaments, the ends of the olfactory nerve. In the frog the free end terminates in fine hairs.

Physical Causes of Smell.—Electrical or thermal stimuli do not usually give rise to olfactory sensations. Althaus states that electrical stimulation caused a sensation of the smell of phosphorus. To excite smell it is usually supposed that substances must be present in the atmosphere in a state of fine subdivision, or existing as vapours or gases. The fineness of the particles is remarkable, because if the air conveying an odour be filtered through a tube packed with cotton wool and inserted into the nose a smell is still discernible. This proceeding completely removes from the air organisms less than the $\frac{1}{100000}$th of an inch in diameter which are the causes of putrefaction and fermentation. A grain or two of musk will scent an apartment for years and at the end of the time no appreciable loss of weight can be detected. Substances exciting smell are no doubt usually gases or vapours. Only a few tentative efforts have been made to connect the sense with the chemical constitution of the substance. One of the most important of these is in an *Essay on Smell*, by Dr. William Ramsay of University College, Bristol. The following gases have no smell:—hydrogen, oxygen, nitrogen, water gas, marsh gas, olefiant gas, carbon monoxide, hydrochloric acid, formic acid vapour, nitrous oxide, and ammonia. (It is necessary, of course, to distinguish between the sensation of smell and the irritant action of such a gas as ammonia.) The gases exciting smell are chlorine, bromine, iodine, the compounds of the first two with oxygen and water, nitric peroxide, vapours of phosphorus and sulphur, arsenic, antimony, sulphurous acid, carbonic acid, almost all the volatile compounds of carbon except those already mentioned, some compounds of selenium and tellurium, the compounds of chlorine, bromine, and iodine with the above-named elements, and some metals. Chlorine, bromine, iodine, sulphur, selenium, and tellurium, which are volatile and give off vapour at ordinary temperatures, have each a characteristic smell. Ramsay points out that as a general rule substances having a low molecular weight have either no smell or simply cause irritation of the nostrils. He also shows that in the carbon compounds increase of specific gravity as a gas is associated to a certain point with a sensation of smell. Take the marsh gas or methane series commonly called the paraffins. The first two have no smell; ethane (fifteen times as heavy as hydrogen) has a faint smell; and it is not till butane (thirty times heavier than hydrogen) that a distinct sensation of smell is noticed. Again, a similar relation exists among the alcohols. Methyl alcohol has no smell. Ethyl, or ordinary alcohol free from ethers and water, has a faint smell; "and the odour rapidly becomes more marked as we rise in the series, till the limit of volatility is reached, and we arrive at solids with such a low vapour tension that they give off no appreciable amount of vapour at the ordinary temperature." Acids gain in odour with increase in density in the form of gas. Thus formic acid is devoid of smell; acetic acid has a characteristic smell; and the higher acids of the series—propionic, butyric, valerianic—increase in odour. It would appear also that "the character of a smell is a property of the element or group which enters into the body producing the smell, and tends to make it generic." Many compounds of chlorine, hydrogen, compounds of sulphur, selenium, and tellurium, the paraffins, the alcohols, the acids, the nitrites,

the amines, the pyridine series, the benzene group, have each a characteristic odour Ramsay has advanced the theory that the sense of smell "is excited by vibrations of a lower period than those which give rise to the sense of light or heat," and he points out a series of important facts in support of this view He states that to produce the sensation of smell a substance must have a molecular weight at least fifteen times that of hydrogen For instance, the specific gravity of marsh gas is eight (no smell), of ethane fifteen (faint smell), of propane twenty-two (distinct smell) Again, prussic acid has a specific gravity of fifteen, and many persons fail to detect its odour Further, Ramsay supposes that smell may be excited by vibrations, and suggests that the period of vibration of the lighter molecules is too rapid to affect the sense, at last a number of vibrations is reached capable of exciting the sense organ, and beyond an upper limit the sense is again lost Graham pointed out that odorous substances are in general readily oxidized [1] Tyndall showed that many odorous vapours have a considerable power of absorbing heat Taking the absorptive capacity of the air as unity, the following absorptions were observed in the respective cases —

Name of Perfume	Absorption per 100	Name of Perfume	Absorption per 100
Patchouli	30	Lavender	60
Sandal-wood	32	Lemon	65
Geranium	33	Portugal	67
Oil of cloves	33.5	Thyme	68
Otto of roses	36.5	Rosemary	74
Bergamot	41	Oil of laurel	80
Neroli	47	Cassia	109

In comparison with the air introduced in the experiments the weight of the odours must be almost infinitely small "Still we find that the least energetic in the list produces thirty times the effect of the air, whilst the most energetic produces 109 times the same effect" [2]

Venturi, B Prévost, and Liégeois have studied the well-known movements of odoriferous particles, such as camphor, succinic acid, &c, when placed on the surface of water, and they have suggested that all odoriferous substances in a state of fine subdivision may move in a similar way on the moist surface of the olfactory membrane, and thus mechanically imitate the nerve-endings This explanation is too coarse, but it is well known that the odours of flowers are most distinctly perceived in the morning, or after a shower, when the atmosphere contains a considerable amount of aqueous vapour It would appear also that the odours of animal effluvia are of a higher specific gravity than the air, and do not readily diffuse,—a fact which may account for the pointer and bloodhound keeping their noses to the ground Such smells are very persistent and are apparently difficult to remove from any surface to which they have become attached The smell of a corpse may haunt a living person for days, notwithstanding copious ablutions and change of clothes [3]

Special Physiology of Smell —It is necessary that the air containing the odour be driven forcibly against the membrane Thus the nostrils may be filled with eau de Cologne, or with air impregnated with sulphuretted hydrogen, and still no odour is experienced if the person does not breathe When a sniff is made the air within the nasal passages is rarefied, and, as the air rushes in to equilibrate the pressure, it is forcibly propelled against the olfactory surface The olfactory surface must be moist; if it is dry, or is covered with too thick a layer of mucus (as in catarrh), the sense is much weakened or lost. The first moment of contact is the most acute and the sense quickly becomes blunted The first scent of a flower is the strongest and sweetest, and after a few minutes' exposure the intensity of even a fœtid odour may not be perceived This fact may be accounted for on the supposition that the olfactory membrane becomes quickly coated with a thin layer of matter, and that the most intense effect is produced when the odoriferous substances are applied to a clean surface The intensity of smell depends on (1) the area of olfactory surface affected, and (2) the degree of concentration of the odoriferous matter It is said that musk to the amount of the two-millionth of a milligramme, and one part of sulphuretted hydrogen in 1,000,000 parts of air, may be perceived If the two nostrils are filled with different odorous substances, there is no mixture of the odours, but we smell sometimes the one and sometimes the other (Valentin) Morphia, mixed with sugar and taken as snuff, paralyses the olfactory apparatus, while strychnine makes it more sensitive (Lichtenfels and Frohlich)

The delicacy of the sense is much greater in many of the lower animals than in man, and it is highly probable that the dog or cat obtain information by means of this sense which a human being cannot get Odours may excite in the minds of many animals vivid impressions, and they have probably a memory of smells which the human being does not possess Even in man the sense may be greatly improved by exercising it A boy, James Mitchell, was born blind, deaf, and dumb, and chiefly depended on smell for keeping up a connexion with the outer world He readily observed the presence of a stranger in the room and he formed his opinions of persons apparently from their characteristic smells In some rare cases, the sense of smell is congenitally absent in human beings, and it may be much injured by the practice of snuffing or by diseases of the nose affecting the olfactory membrane. Subjective impressions of smells, like spectral illusions or sounds in the ears, are occasionally, but rarely observed in the insane Finally, it may be observed that the sense of odour gives information as to the characters of food and drink and as to the purity of the air In the lower animals, also, the sense is associated with the sexual functions

SMELT See SALMONIDÆ, vol xxi p 1

SMETHWICK, an urban sanitary district of Staffordshire, England, on the borders of Worcestershire and Warwickshire, is situated on the Birmingham, Dudley, and Wolverhampton Canal, and on branches of the London and North-Western and the Great Western Railway lines, 3 miles west from Birmingham, of which the town of Smethwick is a suburb It possesses a public hall and a free library and reading-room Within the limits of the district is the Soho foundry originated by James Watt, and since its origin numerous other industries have been concentrated in the suburb, the more important being the manufacture of glass, chemicals, hydraulic jacks, patent nuts and bolts, and patent tubes Many of the works are of great extent. The population of the urban sanitary district in 1871 was 17,158, and in 1881 (area, 1882 acres) it had increased to 25,084

SMIRKE, ROBERT (1752-1845), subject painter, was born at Wigton near Carlisle in 1752 In his thirteenth year he was apprenticed in London with an heraldic painter, and at the age of twenty he began to study in the schools

of the Royal Academy, to whose exhibition he contributed in 1786 a Narcissus and a Sabrina, which were followed by many works, usually small in size, illustrative of the English poets, especially Thomson. In 1791 Smirke was elected an associate of the Royal Academy, and two years later a full member. In 1814 he was nominated keeper to the Academy, but the king refused to sanction the appointment on account of the artist's pronounced revolutionary opinions. He was engaged upon the Shakespeare gallery, for which he painted Katharina and Petruchio, Prince Henry and Falstaff, and other subjects. He also executed many clever and popular book-illustrations. His works, which are frequently of a humorous character, are pleasing and graceful, accomplished in draftsmanship and handled with considerable spirit. He died in London on the 5th of January 1845.

SMITH, ADAM (1723-1790), the greatest of political economists, was the only child of Adam Smith, comptroller of the customs at Kirkcaldy in Fifeshire, Scotland, and of Margaret Douglas, daughter of Mr Douglas of Strathendry, near Leslie. He was born at Kirkcaldy on 5th June 1723, some months after the death of his father. Of a weak constitution, he required and received during his early years the most tender care of an affectionate mother, which he repaid in after life by every attention which filial gratitude could dictate. When he was three years old he was taken on a visit to his uncle at Strathendry, and when playing alone at the door of the house was carried off by a party of "tinkers." Fortunately he was at once missed, and the vagrants pursued and overtaken in Leslie wood. He received his early education in the school of Kirkcaldy under David Miller, amongst whose pupils were many who were afterwards distinguished men. Smith showed as a boy great fondness for books and remarkable powers of memory; and his friendly and generous disposition made him popular amongst his schoolfellows. He was sent in 1737 to the university of Glasgow, where he attended the lectures of Dr Hutcheson; and in 1740 he went to Balliol College, Oxford, as exhibitioner on Snell's foundation, with a view to his taking orders in the English Church. He remained at that university for seven years. At Glasgow his favourite studies had been mathematics and natural philosophy; but at Oxford he appears to have devoted himself almost entirely to moral and political science and to the cultivation of the ancient and modern languages. He also laboured to improve his English style by the practice of translation, particularly from the French. He was not impressed with a favourable opinion of the system of education then pursued at Oxford. After his return to Kirkcaldy he resided there two years with his mother, continuing his studies; he had relinquished the idea of entering the ecclesiastical profession, but had not yet adopted any other plan for his future life. In 1748 he removed to Edinburgh, and there, under the patronage of Lord Kames, gave lectures on rhetoric and belles-lettres. About this time commenced his acquaintance with David Hume, which afterwards ripened into an intimate friendship, founded on mutual esteem; his relations with that great thinker must have powerfully influenced the formation of his opinions. In 1751 he was elected professor of logic at Glasgow, and in the following year was transferred to the chair of moral philosophy in the same university, which had become vacant by the death of Thomas Craigie, the successor of Hutcheson. This position he occupied for nearly twelve years, which he long afterwards declared to have been "by far the most useful, and therefore by far the happiest and most honourable period of his life." He was highly esteemed by his colleagues, of whom, on his side, he speaks as "very excellent men." His course of lectures, as Professor Millar informs us, was divided into four parts—(1) natural theology; (2) ethics; (3) a treatment of that branch of morality which relates to justice, a subject which he handled historically after the manner of Montesquieu, "endeavouring to trace the gradual progress of jurisprudence, both public and private, from the rudest to the most refined ages, and to point out the effects of those arts which contribute to subsistence and to the accumulation of property in producing corresponding improvements or alterations in law and government"; (4) a study of those political regulations which are founded, not upon the principle of justice, but that of expediency, and which are calculated to increase the riches, the power, and the prosperity of a state. Under this view he considered the political institutions relating to commerce, to finances, to ecclesiastical and military establishments. He first appeared as an author by contributing two articles to the *Edinburgh Review* (an earlier journal than the present, which was commenced in 1755, but of which only two numbers[1] were published),—one on Johnson's *Dictionary* and the other a letter to the editors on the state of literature in the different countries of Europe. In 1759 appeared his *Theory of Moral Sentiments*, embodying the second portion of his university course, to which was added in the 2d edition an appendix with the title, "Considerations concerning the first Formation of Languages." After the publication of this work his ethical doctrines occupied less space in his lectures, and a larger development was given to the subjects of jurisprudence and political economy. Stewart gives us to understand that he had already, as early as 1752, adopted the liberal views of commercial policy which he afterwards preached with so much effect; and this we should have been inclined to believe independently from the fact that such views were propounded in that year in the *Political Discourses* of his friend Hume. His residence at Glasgow brought him into personal relations with many intelligent men from whose practical experience he could derive information on mercantile questions; and, on the other hand, we are told, his reasonings convinced several eminent merchants of that city of the soundness of the principles of free trade, which were at variance with their previous opinions.

In 1762 the senatus academicus of Glasgow conferred on him the honorary degree of doctor of laws. In 1763 he was invited to take charge of the young duke of Buccleuch on his travels. He accepted the proposal, and resigned his professorship. He went abroad with his pupil in March 1764; they remained only a few days at Paris and then settled at Toulouse, then the seat of a parliament, where they spent eighteen months in the best society of the place, afterwards making a tour in the south of France and passing two months at Geneva. Returning to Paris about Christmas of 1765, they remained there till the October of the following year. The period was one of intellectual and social ferment, and Smith was brought into relation with the most eminent persons of the time. He lived in the society of Quesnay, Turgot, D'Alembert, Morellet, Helvétius, Marmontel, and the duke de la Rochefoucault. It was the regard he entertained for the young nobleman[2] last named that dictated the omission in the later editions of his *Moral Sentiments* of the name of the celebrated ancestor of the duke, whom he had associated with Mandeville as author of one of the "licentious sys-

[1] These two numbers were reprinted in 1818. Smith's letter to the editors is specially interesting for its account of the *Encyclopédie* and its criticism of Rousseau's pictures of savage life.

[2] The duke undertook a translation of the *Theory of Moral Sentiments*, but the Abbé Blavet's version appeared (1774) before his was completed and he then relinquished the design. An earlier French translation had been published (1764) under the title *Métaphysique de l'Âme*, and there is a later one—the best—by the marquis de Condorcet (1798, 2d ed. 1830).

tems" reviewed in the seventh part of that work. Smith was without doubt much influenced by his contact with the members of the physiocratic school, especially with its chief, though Dupont de Nemours probably goes too far in speaking of Smith and himself as having been "condisciples chez M. Quesnay." Smith afterwards described Quesnay as a man "of the greatest modesty and simplicity," and declared his system of political economy to be, "with all its imperfections, the nearest approximation to truth that had yet been published on the principles of that science." In October 1766 tutor and pupil returned home, and they ever afterwards retained strong feelings of mutual esteem. For the next ten years Smith lived with his mother at Kirkcaldy, only paying occasional visits to Edinburgh and London; he was engaged in close study during most of this time, but unbent his mind in familiar intercourse with a few friends. He describes himself to Hume during this period as being extremely happy, comfortable, and contented. He was now occupied on his *Inquiry into the Nature and Causes of the Wealth of Nations*, which there is some reason for believing he had begun at Toulouse. That great work appeared in 1776.[1] After its publication, and only a few months before his own death, Hume wrote to congratulate his friend—"*Euge! belle!* dear Mr Smith, I am much pleased with your performance, and the perusal of it has taken me from a state of great anxiety. It was a work of so much expectation by yourself, by your friends, and by the public, that I trembled for its appearance; but am now much relieved. Not but that the reading of it requires so much attention, and the public is disposed to give so little, that I shall still doubt for some time of its being at first very popular. But it has depth, and solidity, and acuteness, and is so much illustrated by curious facts that it must at last take the public attention." Smith attended Hume affectionately during a part of his last illness, and soon after the death of the philosopher there was published, along with his autobiography, a letter from Smith to Strahan, in which he gave an account of the closing scenes of his friend's life and expressed warm admiration for his character. This letter excited some rancour among the theologians, and Dr George Horne, afterwards bishop of Norwich, published in 1777, by way of comment on it, *A Letter to Adam Smith on the Life, Death, and Philosophy of his Friend David Hume, by one of the people called Christians*. But Smith took no notice of this effusion.[2] He was also attacked by Archbishop Magee for the omission in subsequent editions of a passage of the *Moral Sentiments* which that prelate had cited with high commendation as among the ablest illustrations of the doctrine of the atonement. Smith had omitted the paragraph in question on the ground that it was unnecessary and misplaced; but Magee suspected him of having been influenced by deeper reasons.

The greater part of the two years which followed the publication of the *Wealth of Nations* Smith spent in London, enjoying the society of the most eminent persons of the day, amongst whom were Gibbon, Burke, Reynolds, and Beauclerk. In 1778 he was appointed, through the influence of the duke of Buccleuch, one of the commissioners of customs in Scotland, and in consequence of this fixed his residence at Edinburgh. His mother, now in extreme old age, lived with him, as did also his cousin, Miss Jane Douglas, who assisted him in the care of his aged parent, and superintended his household. Much of his now ample income is believed to have been spent in secret charities, and he kept a simple, though hospitable, table, at which, "without the formality of an invitation, he was always happy to receive his friends." "His Sunday suppers," says M'Culloch, "were long celebrated at Edinburgh." One of his favourite places of resort in these years was a club of which Dr Hutton, Dr Black, Dr Adam Ferguson, John Clerk the naval tactician, Robert Adam the architect, as well as Smith himself, were original members, and to which Dugald Stewart, Professor Playfair, and other eminent men were afterwards admitted. Another source of enjoyment was the small but excellent library he possessed; it is still preserved in his family; Professor Nicholson has had access to it, and was struck by the varied nature of the collection, and especially by the large number of books of travel and poetry which it contained. In 1787 he was elected lord rector of the university of Glasgow, an honour which he received with "heartfelt joy." If we can believe a note in Wilberforce's *Correspondence*, he visited London in the spring of the same year, and was introduced by Dundas[3] to Pitt, Wilberforce, and others. From the death of his mother in 1784, and that of Miss Douglas in 1788, his health and strength gradually declined, and after a tedious and painful illness he died on 17th July 1790.

Before his decease Smith directed that all his manuscripts except a few selected essays should be destroyed, and they were accordingly committed to the flames. Of the pieces preserved by his desire the most valuable is his tract on the history of astronomy, which he himself described as a "fragment of a great work"; it was doubtless a portion of the "connected history of the liberal sciences and elegant arts" which, we are told, he had projected in early life. Among the papers destroyed were probably, as Stewart suggests, the lectures on natural religion and jurisprudence which formed part of his course at Glasgow, and also the lectures on rhetoric which he delivered at Edinburgh in 1748. To the latter Blair seems to refer when, in his work on *Rhetoric and Belles-Lettres* (1783), he acknowledges his obligations to a manuscript treatise on rhetoric by Smith, part of which its author had shown to him many years before, and which he hoped Smith would give to the public. It was probably the lectures on jurisprudence which Smith had in view when, some time before his death expressing regret that he "had done so little," he added, "I meant to have done more, and there are materials in my papers of which I could have made a great deal." He had promised at the end of his *Theory of Moral Sentiments* a treatise on the general principles of jurisprudence from the historical point of view, which would doubtless have been a development of his university lectures on that subject.

In person Smith was of about the middle size, well made and stout, though not corpulent. His features are said to be well represented in the medallion by Tassie engraved in M'Culloch's edition of the *Wealth of Nations*. His discourses as professor were almost entirely extemporary, and, as he was always interested in his subject, he never failed to interest his hearers. He was sometimes, Millar tells us, embarrassed and spoke with hesitation at the outset; but "as he advanced the matter seemed to crowd upon him, his manner became warm and animated, and his expression easy and fluent." In society, except amongst intimate friends, he spoke but seldom, and was rather disposed to enjoy in silence the gaiety of those around him. He often seemed altogether occupied with his own thoughts, or might even have been supposed, from his looks and gestures, to be "in the fervour of composition." "He was the most absent man in company," says Alexander Carlyle, "that I

[1] Mr J. E. T. Rogers published in the *Academy*, 28th February 1885, a letter of Smith to William Pulteney, written in 1772, from which he thinks it probable that the work lay "unrevised and unaltered" in the author's desk for four years. A similar conclusion seems to follow from a letter of Hume in Burton's *Life*, ii. p. 461.

[2] A story was told by Sir Walter Scott, and is also related in the *Edinburgh Review*, of an "unfortunate rencontre," arising out of the publication of the same letter, between Smith and Dr Johnson, during the visit of the latter to Glasgow. The same story is given in a note in Wilberforce's *Correspondence*, the scene being somewhat vaguely laid in "Scotland." But it is impossible that it should be true; for Johnson made his tour in 1773, whilst Hume's death did not take place till 1776. Smith seems not to have met Johnson in Scotland at all. It appears, however, from Boswell's *Life*, under date of 29th April 1778, that Johnson had on one occasion quarrelled with Smith and treated him rudely at Strahan's house, apparently in London; but, as Robertson met Johnson "for the first time" immediately after that incident, and as we know that Robertson met him in Scotland, it follows that the "unlucky altercation" at Strahan's must have occurred before the Scotch tour, and could have had nothing to do with the letter on Hume's death.

[3] An interesting letter of Smith to Dundas (1st November 1779) on free trade for Ireland is printed in the *Eng. Hist. Review*, No. 2.

ever saw, moving his lips and talking to himself and smiling in the midst of large companies." When called on to give his opinion of the matter under discussion he was apt to do so too much in the manner of a lecture. Easy and flowing as is the style of his books, yet to the end he wrote slowly and with difficulty; he did not usually himself take pen in hand, but dictated to an amanuensis, whilst he walked up and down his apartment. In character he was sincere and earnest, in manner apparently cold, but capable of strong feelings, whether of personal affection or of moral indignation. His frequent acts of beneficence were marked by delicacy no less than by liberality. He was a model of filial love and duty, and took to the last the warmest interest in all that concerned the welfare of his friends.

As a moral philosopher Smith cannot be said to have won much acceptance for his fundamental doctrine. This doctrine is that all our moral sentiments arise from sympathy, that is, from the principle of our nature "which leads us to enter into the situations of other men and to partake with them in the passions which those situations have a tendency to excite." Our direct sympathy with the agent in the circumstances in which he is placed gives rise, according to this view, to our notion of the propriety of his action, whilst our indirect sympathy with those whom his actions have benefited or injured gives rise to our notions of merit and demerit in the agent himself. It seems justly alleged against this system by Dr Thomas Brown that "the moral sentiments, the origin of which it ascribes to our secondary feelings of mere sympathy, are assumed as previously existing in the original emotions with which the secondary feelings are said to be in unison." A second objection urged, perhaps with less justice, against the theory is that it fails to account for the authoritative character which is felt to be inherent in our sense of right and wrong—for what Butler calls the "supremacy of conscience." But those who most strongly dissent from Smith's general doctrine are warm in their admiration of the eloquence of his style—sometimes, however, faulty on the side of redundancy—and the felicity of his illustrations. In all its minor details, says Brown, "the work may be considered as presenting a model of philosophic beauty," and it is universally admitted that the author has thrown much light on many delicate and subtle phenomena of our moral nature. The minute observation and the rare ingenuity which he shows in dealing with the finer traits of character and the less obvious indications of feeling remind us of the similar qualities exhibited in a different field in the *Wealth of Nations*.

It is on the latter work that Smith's fame mainly rests. Under POLITICAL ECONOMY (vol. xix. pp. 365-370) will be found a detailed analysis of the economic scheme contained in it, and an examination of its spirit and tendency as a contribution to the philosophy of society. We have there sufficiently exposed the exaggeration which represents Smith as the creator of political economy. But the *Wealth of Nations* is, without doubt, the greatest existing book on that department of knowledge, the only attempt to replace and so antiquate it—that of John Stuart Mill—having, notwithstanding its partial usefulness, on the whole decidedly failed. Buckle, however, goes too far when he pronounces it "the most important book ever written," just as he similarly exceeds due measure when he makes its author superior as a philosopher to Hume. Mackintosh more justly said of it that it stands on a level with the treatise *De Jure Belli et Pacis*, the *Essay on the Human Understanding*, and the *Spirit of Laws*, in the respect that these four works are severally the most conspicuous landmarks in the progress of the sciences with which they deal. And, when he added that the *Wealth of Nations* was "perhaps the only book which produced an immediate, general, and irrevocable change in some of the most important parts of the legislation of all civilized states," he scarcely spoke too strongly if we understand him as referring to its influence as an agent of demolition. It certainly operated powerfully through the harmony of its critical side with the tendencies of the half-century which followed its publication to the assertion of personal freedom and "natural rights." It discredited the economic policy of the past, and promoted the overthrow of institutions which had come down from earlier times, but were unsuited to modern society. As a theoretic treatment of social economy, and therefore as a guide to social reconstruction and practice in the future, it is provisional, not definitive. But here too it has rendered eminent service: it has established many truths and dissipated many obstinate prejudices; it has raised the views of all thinking men on national wealth to a higher level; and, when the study of its subject comes to be systematized on the basis of a general social philosophy more complete and durable than Smith's, no contributions to that final construction will be found so valuable as his.

Buckle has the idea that the two principal works of Smith, the *Theory of Moral Sentiments* and the *Wealth of Nations*, are mutually complementary parts of one great scheme, in which human nature is intended to be dealt with as a whole,—the former exhibiting the operation of the benevolent feelings, the latter of what, by a singular nomenclature, inadmissible since Butler wrote, he calls "the passion of selfishness." In each division the motor contemplated is regarded as acting singly, without any interference of the opposite principle. This appears to be an artificial and misleading notion. Neither in the plan of Smith's university course nor in the well known passage at the end of his *Moral Sentiments* is there any indication of his having conceived such a bipartite scheme. The object of the *Wealth of Nations* is surely in no sense psychological, as is that of the *Moral Sentiments*. The purpose of the work is to exhibit social phenomena, not to demonstrate their source in the mental constitution of the individual. And Buckle seems to have fallen into the error of confounding "sympathy" with benevolence, or at least of regarding their spheres as coextensive. It is only in his ethical treatise that Smith carries back the pursuit of wealth to its ultimate motive; and, when he does so, instead of tracing it to a selfish principle, which is to be placed in contrast with sympathy, he expressly declares it to have its origin in "a regard to the sentiments of mankind"; in other words, he makes it a consequence of the desire of sympathy.

In relation to Smith's personality, which is at present our principal object, it may be observed that his moral features are exhibited in an interesting way in his great work. The most marked characteristics thus reflected are his strong sympathy with the working classes, his contempt for vulgar politics, and his hatred of the spirit of monopoly,—the last manifesting itself especially in his suspicion of the public conduct of merchants and manufacturers. The first of these sentiments breaks out in several places, as in the discussion of the laws of settlement and in the remarks on combinations, and notably in the often-quoted passage where he says: "It is but equity that those who feed, clothe, and lodge the whole body of the people should have such a share of the produce of their own labour as to be themselves tolerably well fed, clothed, and lodged." He has no respect for that "insidious and crafty animal, vulgarly called a statesman or politician," and complains that the "sneaking arts of underling tradesmen" are erected into political maxims for the conduct of a great empire. "All for ourselves and nothing for other people seems in every age of the world to have been the vile maxim of the masters of mankind." The project of shutting out every other nation from a share in the benefits of our colonial trade he brands as an "invidious and malignant" one. He never tires of condemning the "mean rapacity," the "monopolizing spirit," the "impertinent jealousy," the "interested sophistry" of the capitalist class. "Our merchants and manufacturers," he says—and the remark is not yet out of date—"complain much of the effect of high wages in raising the price, and thereby lessening the sale, of their goods both at home and abroad; they say nothing concerning the bad effects of high profits; they are silent with respect to the pernicious effects of their own gains; they complain only of those of other people." "Their interest is never exactly the same with that of the public; they have generally an interest to deceive and even to oppress the public, and they accordingly have upon many occasions both deceived and oppressed it." This class he regarded, in fact, as corrupting by its selfishness the policy of the European nations and in particular of England, and as constituting the strength of the opposition, which he feared would be insuperable, to a system of commercial freedom. The general impression of its author which the book leaves behind it is that of a large, healthy, and generous nature, earnest in insisting on fair play for all and prompt to denounce with contemptuous vehemence anything which wore the appearance of injustice.

Our principal authority for the biography of Smith is Dugald Stewart's *Account of his Life and Writings*, originally read (1793) before the Royal Society of Edinburgh, and afterwards prefixed to Smith's *Essays on Philosophical Subjects*, as edited by Black and Hutton. Additional particulars are given in Brougham's *Men of Letters and Science*, Burton's *Life of Hume*, and Alexander Carlyle's *Autobiography*; and some characteristic anecdotes of him will be found in *Memoirs of the Life and Works of Sir John Sinclair* (1837). For comments on his *Theory of Moral Sentiments*, see, besides Stewart, as cited above, Dr T. Brown's *Philosophy of the Human Mind*, lects. 80 and 81; Sir J. Mackintosh's *Dissertation on the Progress of Ethical Philosophy*; J. A. Farrer's *Adam Smith* (1881), in the series entitled *English Philosophers*; and the art. ETHICS in the present work. On the *Wealth of Nations*, the student may consult the prefaces to M'Culloch's, Rogers's, and Nicholson's editions of that work; Rogers's *Historical Gleanings* (1869); the art. "Smith" in Coquelin and Guillaumin's *Dictionnaire de l'Économie Politique*; Bagehot's *Economic Studies* (1880); and Cossa's *Guide to the Study of Political Economy* (Eng. trans., 1880), chap. v., where the author has enumerated the most important memoirs by foreign writers on Smith as an economist. (J. K. I.)

SMITH, ALBERT (1816-1860), an instance of the journalistic rather than the truly literary type of writer, was one of the most popular men of his time, a favourite humourist in the vein of humour then in vogue, but now already rather out of date, a leading contributor to *Punch*, the author of successful books of light social satire, and, not least, the exponent of "Mont Blanc" in a pre-scientific popular entertainment descriptive of that famous mountain. He was born at Chertsey, Surrey, on 24th May 1816, and was educated to follow his father's profession of a surgeon. Having, in the course of his medical studies, been to the Hôtel Dieu, Paris, his first literary effort was an account of his life there, which appeared in the *Mirror*.

From this time he gradually relinquished his medical work for the more congenial occupation of light literature. He was associated with *Punch* from its beginning, and was also a regular contributor to *Bentley's Miscellany*, in whose pages his first and best book, *The Adventures of Mr Ledbury*, first appeared. His other books were *A History of Evening Parties*, *Christopher Tadpole*, issued in monthly parts, *Pottleton's Legacy*, and, as a series of so-called natural histories, *The Gent*, *The Ballet Girl*, *The Idler upon Town*, and *The Flirt*. Albert Smith also wrote extravaganzas and adapted some of Charles Dickens's stories for the stage. He conducted too for a time a magazine called *The Man in the Moon*, which was discontinued in 1849. In 1851 he visited the Alps and ascended Mont Blanc, and the year after produced the descriptive entertainment before referred to. "China," a similar entertainment, was afterwards produced, but less successfully. Smith married in 1859 a daughter of Keeley, the comedian. He died at Fulham, Middlesex, on 23d May 1860, from an attack of apoplexy.

SMITH, ALEXANDER (1830-1867), was the most prominent representative of the so-called "spasmodic" school of poetry, whose peculiarities first gained for it a hasty reputation, and then, having suffered under closer critical examination, it almost as speedily dropped out of mind again. Smith has never yet perhaps had his true position assigned to him. His first book, *A Life Drama and other Poems* (1853), which made his name, was a work of real promise. Although deficient in dramatic grasp of subject, in restraint of expression, in metrical quality, and although showing too obviously the influence of Keats and Tennyson in certain exaggerations of epithet and phrase, the book yet contains evidence of a poetic faculty which might, under more fortunate conditions, have developed into genuine power. Alexander Smith was one of those writers who require the critical safeguards of the schools to chasten their somewhat importunate energies, and for want of these academic restrictions he wasted his powers in discursive experiments of not much abiding value. Born at Kilmarnock on the last day of 1830, he received the usual schooling common at that time, and, his parents being too poor to send him to college, he was placed in a linen factory to follow his father's trade of a pattern designer. His literary proclivities, however, soon showed themselves, and from time to time his early poems appeared in the *Glasgow Citizen*, in whose editor, James Hedderwick, he found a sympathizing and appreciative friend. His poems, having attracted the attention also of the Rev. George Gilfillan, found through him an opening in the London *Citizen*. *A Life Drama and other Poems*, published in 1853, speedily ran through several editions, and gained Smith the appointment of secretary to Edinburgh university in 1854. In the same year Sydney Dobell, whose name is now familiarly associated with Smith's, came to Edinburgh, and an acquaintanceship at once sprang up between the two, which resulted in their collaboration in a book of *War Sonnets*, inspired by the Crimean War, which was published in 1855. The volumes of verse issued independently by Alexander Smith in the ensuing years did not receive much attention, their author then turned himself to prose, after publishing *City Poems* in 1857 and *Edwin of Deira*, a Northumbrian epic poem, in 1861. His first prose work was *Dreamthorpe*, 1863, it was followed in 1865 by *A Summer in Skye*, which contains his best prose writing, and is full of a quiet charm and true sympathy with nature. His last work was an experiment in fiction, *Alfred Hagart's Household* (1866), which ran first through *Good Words*. In this the same faults of construction, conjoined with the same incidental grace of description, that show themselves in his larger poems are repeated. The strain produced by his literary and other work began to tell towards the end of 1866, and his death followed on 5th January 1867.

A memoir of Smith by P. P. Alexander is prefixed to a volume of remains, entitled *Last Leaves*, in which will be found a fairly complete account of his life and writings.

SMITH, COLVIN (1795-1875), portrait painter, was born at Brechin, Scotland, in 1795. He studied in London in the schools of the Royal Academy and worked in Nollekens's studio. He then proceeded to Italy, where he executed some fine copies from Titian, and at Antwerp he made studies from the works of Rubens. Returning to Scotland in 1827, he settled in Edinburgh, occupying the house and studio which had formerly belonged to Raeburn. Soon he attained a wide practice as a portrait-painter, and among his sitters were Lord Jeffrey, Henry Mackenzie, author of *The Man of Feeling*, and many of the most celebrated Scotsmen of the time. His portrait of Sir Walter Scott was so popular that he executed some twenty replicas of it, for seven of which he received fresh sittings. His works are distinguished by excellent draftsmanship, by directness and simplicity of treatment, and by well-marked individuality. He died in Edinburgh on 21st July 1875.

SMITH, HENRY JOHN STEPHEN (1826-1883), mathematician, was born in Dublin on 2d November 1826 and was the fourth child of his parents. When Henry Smith was just two years old his father died, whereupon his mother left Ireland for England. Mrs Smith taught her children herself, and until Henry was over eleven he was under her exclusive care and teaching, after that he was educated by private tutors till he went to Rugby in 1841. Whilst under the first of these tutors, in nine months he read all Thucydides, Sophocles, and Sallust, twelve books of Tacitus, the greater part of Horace, Juvenal, Persius, and several plays of Æschylus and Euripides. He also got up six books of Euclid and some algebra, besides reading a considerable quantity of Hebrew and learning the *Odes* of Horace by heart. On the death of his elder brother in September 1843 Henry Smith left Rugby, and in the end of 1844 gained a scholarship at Balliol College, Oxford. He won the Ireland scholarship in 1848 and obtained a first class in both the classical and the mathematical schools in 1849. He gained the senior mathematical scholarship in 1851. He was elected fellow of Balliol in 1850 and Savilian professor of geometry in 1861, and in 1874 was appointed keeper of the university museum. He was elected F.R.S. in 1861, and was an LL.D. of Cambridge and Dublin. He served on various royal commissions, and from 1877 was the chairman of the managing body of the meteorological office. He died at Oxford on 9th February 1883.

After taking his degree he wavered between classics and mathematics, but finally chose the latter. After publishing a few short papers relating to theory of numbers and to geometry, he devoted himself to a thorough examination of the writings of Gauss, Lejeune Dirichlet, Kummer, &c., on the theory of numbers. The main results of these researches, which occupied him from 1854 to 1864, are contained in his *Report on the Theory of Numbers*, which appeared in the British Association volumes from 1859 to 1865. This report contains not only a complete account of all that had been done on this vast and intricate subject but also original contributions of his own. Some of the most important results of his discoveries were communicated to the Royal Society in two memoirs upon Systems of Linear Indeterminate Equations and Congruences and upon the Orders and Genera of Ternary Quadratic Forms (*Phil. Trans.*, 1861 and 1867). He did not, however, confine himself to the consideration of forms involving only three indeterminates, but succeeded in establishing the principles on which the extension to the general case of n indeterminates depends, and obtained the general formulæ, thus effecting what is probably the greatest advance made in the subject since the publication of Gauss's *Disquisitiones Arithmeticæ*. A brief abstract of Smith's methods and results appeared in the *Proc. Roy. Soc.* for 1864 and 1868. In the second of these notices he gives the general formulæ without demonstrations. As corollaries to the general formulæ he adds the formulæ relating to the representation of a number as a sum of five

squares and also of seven squares This class of representation ceases when the number of squares exceeds eight The cases of two, four, and six squares had been given by Jacobi and that of three squares by Eisenstein, who had also given without demonstration some of the results for five squares Fourteen years later the French Academy, in ignorance of Smith's work, set the demonstration and completion of Eisenstein's theorems for five squares as the subject of their "Grand Prix des Sciences Mathematiques" Smith, at the request of a member of the commission by which the prize was proposed, undertook in 1882 to write out the demonstration of his general theorems so far as was required to prove the results for the special case of five squares A month after his death, in March 1883, the prize of 3000 francs was awarded to him The fact that a question of which Smith had given the solution in 1867, as a corollary from general formulæ governing the whole class of investigations to which it belonged, should have been set by the French Academy as the subject of their great prize shows how far in advance of his contemporaries his early researches had carried him Many of the propositions contained in his dissertation are general, but the demonstrations are not supplied for the case of seven squares He was also the author of important papers in which he extended to complex quadratic forms many of Gauss's investigations relating to real quadratic forms After 1864 he devoted himself chiefly to elliptic functions, and numerous papers on this subject were published by him in the *Proc Lond Math Soc* and elsewhere At the time of his death he was engaged upon a memoir on the *Theta and Omega Functions*, which he left nearly complete In 1868 he was awarded the Steiner prize of the Berlin Academy for a geometrical memoir, *Sur quelques problèmes cubiques et biquadratiques* He also wrote the introduction to the collected edition of Clifford's *Mathematical Papers* (1882) The three subjects to which Smith's writings relate are theory of numbers, elliptic functions, and modern geometry, but in all that he wrote an "arithmetical" mode of thought is apparent, his methods and processes being arithmetical as distinguished from algebraic He had the most intense admiration of Gauss He was president of the mathematical and physical section of the British Association at Bradford in 1873 and of the London Mathematical Society in 1874-76 A memorial edition of his collected mathematical works is being (1887) printed by the Oxford university press

An article in the *Spectator* of 17th February 1883, written by Lord Justice Bowen, gives perhaps the best idea of Smith's extraordinary personal qualities and influence, his sound judgment, perfect temper, gentle and Lælian wisdom, sweetness of character, delicate gaiety of spirit, and brilliant conversational power, which made him one of the most accomplished and attractive ornaments of any educated company in which he moved

For further details relating to Henry Smith, reference should be made to the *Fortnightly Review* for May 1883 and to the "Monthly Notices" of the Roy Ast Soc, vol xliv

SMITH, JAMES (1775-1839) and HORACE (1779-1849), sons of an eminent and prosperous London solicitor, were born, the former on 10th February 1775 and the latter on 31st December 1779, both in London They were joint authors of the *Rejected Addresses*, described by Horace as "one of the luckiest hits in literature" The occasion of this happy *jeu d'esprit* was the rebuilding of Drury Lane theatre in 1812, after a fire in which it had been burnt down The managers had offered a prize of £50 for an address to be recited at the reopening in October Six weeks before that date the happy thought occurred to the brothers Smith of feigning that the most popular poets of the time had been among the competitors and issuing a volume of unsuccessful addresses in parody of their various styles They divided the task between them, James taking Wordsworth, Southey, Coleridge, and Crabbe, while Byron, Moore, Scott, and Bowles were assigned to Horace[1] The parodists were ready with their small volume by October, but they had some difficulty in getting a publisher, although the success of their clever imitations once published was such that seven editions were called for within three months The *Rejected Addresses* are the most widely popular parodies ever published in England, and have taken quite a classical rank in that kind of literature The brothers fairly divided the honours the elder brother's Wordsworth is evenly balanced by the younger's Scott, and both had a hand in Byron A striking feature in the parodies is the absence of malice, none of the caricatured bards took offence, while the imitation is so clever that both Byron and Scott are recorded to have said in effect that they could hardly believe they had not written the addresses ascribed to them

After this brilliant success James, the elder brother, determined, as he said, "to leave off a winner" and follow Warburton's advice to Anstey "Young man, you have written a highly successful work, never put pen to paper again" He was tempted occasionally to transgress this self-denying ordinance, and made another hit in writing *Country Cousins*, *A Trip to Paris*, *A Trip to America*, and other lively skits for Charles Mathews, earning from the comedian the praise of being "the only man who can write clever nonsense" His social reputation as a wit stood high He was reputed one of the best of conversers in an age when the art was studied, and it was remarked that he held his own without falling into the great error of wits,—sarcasm But for all his good-nature he did not wholly escape the Charybdis of great talkers,—the charge of being something of a bore In his old age the irreverent *Fraser's* put him in its gallery of living portraits as a gouty and elderly but painstaking joker He died in London on 26th December 1839

Horace Smith was less timorously careful of his poetical reputation than his elder brother, whom he survived, and, after making a fortune as a stockbroker, followed in the wake of Scott and wrote about a score of historical novels, —*Brambletye House*, *Tor Hill*, *Reuben Apsley*, *Zillah*, *The New Forest*, *Walter Colyton*, &c His sketches of eccentric character are brilliant and amusing, but he was more of an essayist than a story-teller He began in 1826, when Scott, still retaining his hold on the public, had made success impossible for imitators with less wealth of historical substance and inferior command of stirring incident As he went on he encountered such competitors as Bulwer Lytton, Disraeli, Marryat, and Dickens Still Horace Smith established a fair reputation, and some of his novels may still be found in the smoking-rooms of country houses He was also a frequent contributor to the *New Monthly Magazine* under the editorship of Campbell Three volumes of *Gaieties and Gravities*, published in 1826, contain many witty essays both in prose and in verse, but the only single piece that has taken a permanent place is the "Address to the Mummy in Belzoni's Exhibition" There is more of earnest in this than is generally found in his jesting In private life Horace Smith was not less popular than his brother, though less ambitious of renown as a talker It was of him that Shelley said "Is it not odd that the only truly generous person I ever knew who had money enough to be generous with should be a stockbroker? He writes poetry and pastoral dramas and yet knows how to make money, and does make it, and is still generous" Horace Smith died at Tunbridge Wells on 12th July 1849

SMITH, JOHN (1580-1631), usually distinguished as Captain John Smith, some time president of the English colony in Virginia, was the elder son of George Smith, a well-to-do tenant-farmer on the estate of Lord Willoughby d'Eresby at Willoughby near Alford in Lincolnshire The life of this Virginian hero falls conveniently into five periods

The first of these, 1580-1596, that of his early youth, is thus described by himself in his *Travels* "He was born [1580] in Willoughby in Lincolnshire and was a scholar in the two free schools of Alford and Louth His parents, dying [April 1596] when he was thirteen [or rather fifteen] years of age, left him a competent means, which he, not being capable to manage, little regarded His mind being even then set upon brave adventures, he sold his satchel,

[1] The particulars of the authorship are given in the 18th edition (1820), and in the memoir of his brother by Horace prefixed to a collection of fugitive pieces (1840) James contributed the first stanza to the imitation of Byron, but otherwise they worked independently

books, and all he had, intending secretly to get to sea, but that his father's death stayed him. But now the guardians of his estate more regarding it than him, he had liberty enough, though no means, to get beyond the sea. About the age of fifteen years, he was bound an apprentice to Master Thomas Sendall of [King's] Lynn, the greatest merchant of all those parts; but, because he would not presently send him to sea, he never saw his master in eight years after."

The second period, 1596-1604, is that of his adventures in Europe, Asia, and Africa. He first went to Orleans in attendance on the second son of Lord Willoughby. Thence he returned to Paris, and so by Rouen to Havre, where, his money being spent, he began to learn the life of a soldier under Henry IV of France. On the conclusion of the peace with the League he went with Captain Joseph Duxbury to Holland and served there some time, probably with the English troops in Dutch pay. By this time he had gained a wide experience in the art of war, not merely as an infantry officer, but also in those more technical studies which are now followed by the Royal Engineers. At length he sailed from Enkhuisen to Scotland, and on the voyage had a narrow escape from shipwreck upon Holy Island near Berwick. After some stay in Scotland he returned home to Willoughby, "where, within a short time being glutted with too much company, wherein he took small delight, he retired himself into a little woody pasture, a good way from any town, environed with many hundred acres of other woods. Here by a fair brook he built a pavilion of boughs, where only in his clothes he lay. His study was Machiavelli's *Art of War* and Marcus Aurelius; his exercise a good horse with his lance and ring; his food was thought to be more of venison than anything else; what [else] he wanted his man brought him. The country wondering at such a hermit, his friends persuaded one Signior Theadora Polaloga, rider to Henry, earl of Lincoln, an excellent horseman and a noble Italian gentleman, to insinuate [himself] into his woodish acquaintances, whose languages and good discourse and exercise of riding drew Smith to stay with him at Tattersall. Thus, when France and the Netherlands had taught him to ride a horse and use his arms, with such rudiments of war as his tender years, in those martial schools, could attain unto, he was desirous to see more of the world, and try his fortune against the Turks, both lamenting and repenting to have seen so many Christians slaughter one another."

Next came his wanderings through France from Picardy to Marseilles. There he took ship for Italy in a vessel full of pilgrims going to Rome. These, cursing him for a heretic, and swearing they would have no fair weather so long as he was on board, threw him, like another Jonah, into the sea. He was able to get to a little uninhabited island, from which he was taken off the next morning by a Breton ship of 200 tons going to Alexandria, the captain of which, named La Roche, treated him as a friend. In this ship he visited Egypt and the Levant. On its way back the Breton ship fought a Venetian argosy of 400 tons and captured it. Reaching Antibes (Var) later on, Captain La Roche put Smith ashore with 500 sequins, who then proceeded to see Italy as he had already seen France. Passing through Tuscany he came to Rome, where he saw Pope Clement VIII at mass, and called on Father R. Parsons. Wandering on to Naples and back to Rome, thence through Tuscany and Venice, he came to Gratz in Styria. There he received information about the Turks who were then swarming through Hungary, and, passing on to Vienna, entered the emperor's service.

In this Turkish war the years 1601 and 1602 soon passed away; many desperate adventures did he go through, and one in particular covered him with great honour. At Regal (Stuhlweissenburg), in the presence of two armies, as the champion of the Christians, he fought on horseback and killed three Turkish champions in succession. On 18th November 1602, at the battle of Rothenthurm, a pass in Transylvania, where the Christians fought desperately against an overpowering force of Crim Tatars, Smith was left wounded on the field of battle. His rich dress saved him, for it showed that he would be worth a ransom. As soon as his wounds were cured he was sold for a slave and then marched to Constantinople, where he was presented to Charatza Tragabigzanda, who fell in love with him. Fearing lest her mother should sell him, she sent him to her brother Timor, pasha of Nalbrits, on the Don, in Tartary. "To her unkind brother this kind lady wrote so much for his good usage that he half suspected as much as she intended; for she told him, he should there but sojourn to learn the language, and what it was to be a Turk, till time made her master of herself. But the Timor, her brother, diverted all this to the worst of cruelty. For, within an hour after his arrival, he caused his 'drubman' to strip him naked, and shave his head and beard so bare as his hand. A great ring of iron, with a long stalk bowed like a sickle, was riveted about his neck, and a coat [put on him] made of ulgry's hair, guarded about with a piece of an undressed skin. There were many more Christian slaves, and nearly a hundred *forsados* of Turks and Moors, and he being the last was the slave of slaves to them all." While at Nalbrits the English captain kept his eyes open, and his account of the Crim Tatars is careful and accurate. "So long he lived in this miserable estate, as he became a thresher at a grange in a great field, more than a league from the Timor's house. The pasha, as he oft used to visit his granges, visited him, and took occasion so to beat, spurn, and revile him, that forgetting all reason Smith beat out the Timor's brains with his threshing bat, for they have no flails, and, seeing his estate could be no worse than it was, clothed himself in the Timor's clothes, hid his body under the straw, filled his knapsack with corn, shut the doors, mounted his horse, and ran into the desert at all adventure." For eighteen or nineteen days he rode for very life until he reached a Muscovite outpost on the river Don; here his irons were taken off him, and the Lady Callamata largely supplied all his wants. Thence he passed, attracting all the sympathy of an escaped Christian slave, through Muscovy, Hungary, and Austria until he reached Leipsic in December 1603. There he met his old master, Prince Sigismund, who, in memory of his gallant fight at Regal, gave him a grant of arms and 500 ducats of gold. Thence he wandered on, sightseeing, through Germany, France, and Spain, until he came to Saffi, from which seaport he made an excursion to the city of Morocco and back.

While at Saffi he was blown out to sea on board Captain Merham's ship, and had to go as far as the Canaries. There Merham fought two Spanish ships at once and beat them off. Smith came home to England with him, having a thousand ducats in his purse.

The third period, 1605-1609, is that of Captain Smith's experiences in Virginia. Throwing himself into the colonizing projects which were then coming to the front, he first intended to have gone out to the colony on the Oyapok in South America; but, Captain Ley dying, and the reinforcement miscarrying, "the rest escaped as they could." Hence Smith did not leave England on this account. But he went heartily into the Virginian project with Captain Bartholomew Gosnold and others. He states that what he got in his travels he spent in colonizing. "When I went first to these desperate designs, it cost me many a forgotten pound to hire men to go, and

procrastination caused more to run away than went I have spared neither pains or money according to my ability, first to procure His Majesty's letters patents, and a company here, to be the means to raise a company to go with me to Virginia, which beginning here and there cost me nearly five years' [1604-1609] work, and more than five hundred pounds of my own estate, besides all the dangers, miseries, and incumbrances I endured gratis " Two colonizing associations were formed,—the London Company for South Virginia and the Western Company for North Virginia Smith was one of the founders of the London Company The colonies which Sir W Raleigh had established at Roanoke and other islands off the American coast had all perished, mainly for want of a good harbour, so that really nothing at all was known of the Virginian coast-line when the first expedition left London on 19th December 1606, and therefore the attempt was bound to fail unless a convenient harbour should be found The expedition consisted of three ships (the "Susan Constant," 100 tons, Captain C Newport, the "God Speed," 40 tons, Captain B Gosnold, and a pinnace of 20 tons, Captain J Ratcliffe), with about 140 colonists and 40 sailors They made first for the West Indies, reaching Dominica on 24th March 1607 At Nevis, their next stopping place, a gallows was erected to hang Captain Smith on the false charge of conspiracy, but he escaped, and, though afterwards the lives of all the men who plotted against him were at his mercy, he spared them Sailing northwards from the West Indies, not knowing where they were, the expedition was most fortunately, in a gale, blown into the mouth of Chesapeake Bay, discovering land on 26th April 1607 Anchoring, they found the James river, and, having explored it, fixed upon a site for their capital in the district of the chief or weroance of Paspaheh, its chief recommendation being that there were 6 fathoms of water so near to the shore that the ships could be tied to the trees Orders had been sent out for the government of the colony in a box, which was opened on 26th April 1607 Captains B Gosnold, E M Wingfield, C Newport, J Smith, J Ratcliffe, J Martin, and G Kendall were named to be the council to elect an annual president, who, with the council, should govern Wingfield was, on 13th May, elected the first president, and the next day they landed at James Town and commenced the settlement

All this while Smith was under restraint, for thirteen weeks in all His enemies would have sent him home, out of a sham commiseration for him, but he challenged their charges, and so established his innocency that Wingfield was adjudged to give him £200 as damages After this, on 20th June 1607, Smith was admitted to the council

As in going to America in those days the great difficulty was want of water, so in those colonizing efforts the paramount danger was from want of food "There were never Englishmen left in a foreign country in such misery as we were in this new discovered Virginia We watched every three nights [every third night], lying on the bare cold ground, what weather soever came, and warded all the next day, which brought our men to be most feeble wretches Our food was but a small can of barley sodden in water to five men a day Our drink, cold water taken out of the river, which was, at a flood, very salt, at a low tide, full of slime and filth, which was the destruction of many of our men " So great was the mortality that out of 105 colonists living on the 22d June 1607 67 died by the following 8th January The country they had settled in was sparsely populated by many small tribes of Indians, who owned as their paramount chief, Powhatan, who then lived at Werowocomoco, a village on the Pamunkey river, about 12 miles by land from James Town Various boat expeditions left James Town, to buy food in exchange for copper They generally had to fight the Indians first, to coerce them to trade, but afterwards paid a fair price for what they bought

On 10th December 1607 Captain Smith, of whom it is said "the Spaniard never more greedily desired gold than he victail," with nine men in the barge, left James Town to get more corn, and also to explore the upper waters of the Chickahominy They got the barge up as far as Apocant Seven men were left in it, with orders to keep in midstream They disobeyed, went into the village, and one of them, George Cassen, was caught, the other six, barely escaping to the barge, brought it back to James Town It so happened that Opecanchanough (the brother of Powhatan, whom he succeeded in 1618, and who carried out the great massacre of the English on Good Friday 1622) was in that neighbourhood with two or three hundred Indians on a hunting expedition He ascertained from Cassen where Smith was, who, ignorant of all this, had, with Jehu Robinson and Thomas Emery, gone in a canoe 20 miles farther up the river The Indians killed Robinson and Emery while they were sleeping by the camp fire, and went after Smith, who was away getting food They surprised him, and, though he bravely defended himself, he had at last to surrender He then set his wits to confound them with his superior knowledge, and succeeded Opecanchanough led him about the country for a wonder, and finally, about 5th January 1608, brought him to Powhatan at Werowocomoco "Having feasted him after their best barbarous manner they could, a long consultation was held, but the conclusion was two great stones were brought before Powhatan, then as many as could laid hands on Smith, dragged him to them, and thereon laid his head And, being ready with their clubs to beat out his brains, Pocahontas, the king's dearest daughter, when no entreaty could prevail, got his head in her arms and laid her own upon his to save him from death Whereat the emperor was contented Smith should live, to make him hatchets, and her bells, beads, and copper, for they thought him as well of all occupations [handicrafts] as themselves "

The truth of this story was never doubted till 1866, when the eminent antiquary, Dr Charles Deane of Cambridge, Mass, in reprinting Smith's first book, the *True Relation* of 1609, pointed out that it contains no reference to this hairbreadth escape Since then many American historians and scholars have concluded that it never happened at all, and, in order to be consistent, they have tried to prove that Smith was a blustering braggadocio, which is the very last thing that could in truth be said of him The rescue of a captive doomed to death by a woman is not such an unheard-of thing in Indian stories If the truth of this deliverance be denied, how then did Smith come back to James Town loaded with presents, when the other three men were killed, George Cassen in particular, in a most horrible manner? And how is it, supposing Smith's account to be false, that Pocahontas afterwards frequently came to James Town, and was next to Smith himself the salvation of the colony? The fact is, nobody doubted the story in Smith's lifetime, and he had enemies enough [1]

[1] Pocahontas never visited James Town after Smith went to England in October 1609, until she was brought there a state prisoner in April 1613 by Captain S Argall, who had obtained possession of her by treachery on the Potomac river The colony, while treating her well, used her as a means to secure peace with the Indians In the meantime, believing Smith to be dead, she fell in love with an English gentleman, John Rolfe, apparently at that time a widower They were married about 1st April 1614 Subsequently she embraced Christianity Sir T Dale, with Rolfe and his wife, landed at Plymouth on 12th June 1616 Before she reached London, Smith

Space fails to describe how splendidly Smith worked after his deliverance for the good of the colony, how he explored Chesapeake Bay and its influents, how (when all others had failed) the presidency was forced on him on 10th September 1608; how he tried to seize Powhatan at Werowocomoco on 12th January 1609, but he fled to Orapakes, 40 miles farther off; how with only eighteen men he cowed Opecanchanough in his own house at Pamunkey, in spite of the hundreds of Indians that were there, and made him sell corn; how well he administered the colony all through the spring and summer of 1609.

Meanwhile the establishment of this forlorn hope in Virginia had stirred up a general interest in England, so that the London Company were able in June 1609 to send out 9 ships with 500 colonists. Smith had now got the Indians into splendid order; but from the arrival on 11th August of the newcomers his authority came to an end. They refused to acknowledge him, and robbed and injured the Indians, who attacked them in turn. Smith did his best to smooth matters, while the rioters were plotting to shoot him in his bed. In the meantime he was away up the river. On his return, "sleeping in his boat, accidentally one fired his powder bag, which tore his flesh from his body and thighs, 9 or 10 inches square, in a most pitiful manner; but to quench the tormenting fire frying him in his clothes he leaped overboard into the deep river, where, ere they could recover him, he was nearly drowned." Thus disabled, he was sent home on 4th October 1609 and never set foot in Virginia again. Nemesis overtook the rioters the winter after he left, which is known in Virginian story as "the starving time." Out of 490 persons in the colony in October 1609 all but 60 died by the following March.

The rest of Smith's life can only be briefly touched upon. The third period, 1610-1617, was chiefly spent in discovering Nusconcus, Canada, and Pemaquid in North Virginia, to which, at his solicitation, Prince Charles gave the name of New England. His first object was to fish for cod and barter for furs, his next, to discover the coast-line with the view to settlement. Two attempts, in 1615 and 1617, to settle at Capawuck failed, but through no fault of his. It was in connexion with these projects that the Western Company for North Virginia gave him the title of admiral of New England. We cannot better conclude this sketch of his active operations than in his own words printed in 1631: "Having been a slave to the Turks, prisoner among the most barbarous savages; after my deliverance commonly discovering and ranging those large rivers and unknown nations with such a handful of ignorant companions that the wiser sort often gave me up for lost; always in mutinies, wants, and miseries; blown up with gunpowder; a long time a prisoner among the French pirates, from whom escaping in a little boat by myself, and adrift all such a stormy winter night, when their ships were split, more than £100,000 lost which they had taken at sea, and most of them drowned upon the Isle of Rhé—not far from whence I was driven on shore, in my little boat, &c. And many a score of the worst winter months have [I] lived in the fields; yet to have lived near thirty-seven years [1593-1630] in the midst of wars, pestilence, and famine, by which many a hundred thousand have died about me, and scarce five living of them that went first with me to Virginia, and yet to see the fruits of my labours thus well begin to prosper (though I have but my labour for my pains), have I not much reason, both privately and publicly to acknowledge it, and give God thanks?"

The last period, 1618-1631, of Smith's life was chiefly devoted to authorship. In 1618 he applied (in vain) to Lord Bacon to be numbered among his servants. In 1619 he offered to lead out the pilgrim fathers to North Virginia; but they would not have him, he being a Protestant and they Puritans. The London Virginia Company became bankrupt for £200,000 in 1624. A list of his publications will be found at the end of this article. Thus having done much, endured much, and written much, while still contemplating a *History of the Sea*, Captain John Smith died on 21st June 1631, and was buried in St Sepulchre's Church, London.

Two of the sixty survivors of "the starving time," Richard Pots and William Phettiplace, thus nobly expressed in print, so early as 1612, their estimate of Smith: "What shall I say? but thus we lost him [4th October 1609] that in all his proceedings made justice his first guide and experience his second; ever hating baseness, sloth, pride, and indignity more than any dangers; that never allowed more for himself than his souldiers with him; that upon no danger would send them where he would not lead them himself; that would never see us want what he either had, or could by any means get us; that would rather want than borrow or starve than not pay; that loved actions more than words, and hated falsehood and cozenage than death; whose adventures were our lives, and whose loss our deaths."

A fairly complete bibliography will be found in Professor Edward Arber's reprint of Smith's *Works*, Birmingham, 1884, 8vo. The order of their first appearance is, *A True Relation*, &c., 1608 (first attributed to a gentleman of the colony, next to Th. Watson, and finally to Captain Smith); *A Map of Virginia*, ed. by W[illiam] S[immonds], Oxford, 1612; *A Description of New England*, 1616; *New England's Trials*, 1620; *New England's Trials*, 2d ed., 1622; *The General History of Virginia, New England, and the Summer Isles*, 1624; *An Accidence for all Young Seamen*, 1626; the same work recast and enlarged as *A Sea Grammar*, 1627, both works continuing on sale for years, side by side; *The True Travels*, &c., 1630; *Advertisements for the Unexperienced Planters*, &c., 1631. Of some of the smaller texts limited 4to editions have been published in the United States by Dr C. Deane, J. Carter Brown, and others. (E. A.)

SMITH, JOHN RAPHAEL (1752-1812), English painter and mezzotint engraver, a son of Thomas Smith of Derby, the landscape painter, was born in 1752. He was apprenticed to a linen draper in Derby, and afterwards pursued the same business in London, adding, however, to his income by the production of miniatures. He then turned to engraving, and executed his plate of the Public Ledger, which had great popularity, and was followed by his mezzotints of Edwin the Minstrel (a portrait of Thomas Haden), after Wright of Derby, and Mercury Inventing the Lyre, after Barry. He reproduced some forty of the works of Reynolds, some of these plates ranking among the masterpieces of the art of mezzotint, and he was appointed engraver to the Prince of Wales. Adding to his artistic pursuits an extensive connexion as a print-dealer and publisher, he would soon have acquired wealth had it not been for his dissipated habits. He was passionately attached to field-sports, pugilism, and the stage, and was a boon companion of George Morland, whose figure-pieces he excellently mezzotinted. He executed many original portraits in chalks, and painted subject-pictures such as the Unsuspecting Maid, Inattention, and the Moralist, exhibiting in the Royal Academy from 1779 to 1790. Upon the decline of his business as a printseller he made a tour as an itinerant portrait painter through the northern and midland counties of England, producing much hasty and indifferent work, and settled in Doncaster, where he died on 2d March 1812.

As a mezzotint engraver Smith occupies the very first rank. His

petitioned Queen Anne on her behalf; and it is in this petition of June 1616 that the account of his deliverance by the Indian girl first appears. After a pleasant sojourn of about seven months, being well received both by the court and the people, Pocahontas with her husband embarked for Virginia in the *George*, Captain S. Argall (her old captor), but she died off Gravesend about February 1617.

prints are delicate, excellent in drawing, and finely expressive of colour His small full-lengths in crayons and his portraits of Fox, Horne Tooke, Sir Francis Burdett, and the group of the duke of Devonshire and family support his claims as a successful draftsman and painter He was possessed of a very thorough knowledge of the principles and history of art, and was a brilliant conversationalist

SMITH, JOSEPH See MORMONS

SMITH, SYDNEY (1771-1845), one of the founders of the *Edinburgh Review*, and one of the wittiest talkers and political writers of his generation, was the son of an English country gentleman, and was born at Woodford in Essex on 3d June 1771 His father, a man of restless ingenuity and activity, "very clever, odd by nature, but still more odd by design," who bought, altered, spoiled, and sold about nineteen different estates in England, had talent and eccentricity enough to be the father of such a wit as Sydney Smith on the strictest principles of heredity, but Sydney was wont himself to attribute not a little of his constitutional gaiety to an infusion of French blood, his maternal grandfather being a French Protestant refugee of the name of Ollier, who could not speak a word of English Sydney was the second of a family of four brothers and one sister, all remarkable for their talents While two of the brothers, "Bobus" and Cecil, were sent to Eton, Sydney was sent with the youngest to Winchester, where he rose to be captain of the school, and with his brother so distinguished himself that their schoolfellows signed a round-robin "refusing to try for the college prizes if the Smiths were allowed to contend for them any more, as they always gained them" From Winchester Sydney went to New College, Oxford, and in due course became a fellow of his college It was his wish then to read for the bar, but his father would add nothing to his fellowship, and he was reluctantly compelled to enter the church, and became a curate in a small village in the midst of Salisbury Plain From this dreary incumbency he was relieved after two years, and conducted to the scene of the foundation of the *Edinburgh Review* by a combination of accidents The squire of the parish invited the new curate to dine, was astonished and charmed to find such a man in such a place, and engaged him after a time as tutor to his eldest son "It was arranged," he afterwards said, "that I and his son should proceed to the university of Weimar We set out, but before reaching our destination Germany was disturbed by war, and in stress of politics we put into Edinburgh" This was in 1797 In Edinburgh, as everywhere else, Smith made numerous friends, whose cordiality was in no way abated by his constant quizzing of the national foibles and peculiarities, and among those friends were the future Edinburgh Reviewers It was towards the end of his five years' residence in Edinburgh, in the elevated residence of the then Mr Jeffrey, "in the eighth or ninth story or flat in a house in Buccleuch Place," that Sydney Smith proposed the setting up of a review as an organ for the opinions and a vehicle for the ambition of the young malcontents with things as they were "I was appointed editor," he says in the preface to the collection of his contributions, "and remained long enough in Edinburgh to edit the first number [October 1802] of the *Edinburgh Review* The motto I proposed for the *Review* was 'Tenui musam meditamur avena'—'We cultivate literature on a little oatmeal' But this was too near the truth to be admitted, and so we took our present grave motto from Publius Syrus, of whom none of us had, I am sure, ever read a single line" He continued to write for the *Review* for the next quarter of a century, and his brilliant articles were a main element in its success They represent the very perfection of journalism They were not merely the most readable, the most entertaining the solidity of substance and the seriousness of purpose were quite as indisputable as the brilliancy of the execution The writer seemed to tackle the gravest of political and social questions in the highest of spirits, yet he never lost sight of his aim in purposeless buffoonery, and, however heartily the reader might be made to laugh, the laughter was always directed at what seemed to the writer absurd and unreasonable opinion It was remarked of his wit in conversation that the butts of it were often seen to laugh as heartily as the audience, there was nothing base and personal in Sydney Smith's raillery The same with his writing when it was anonymous His wonderful powers of humorous exaggeration were such as to detach a ridiculous opinion as far as possible from its human incarnation and present it in the bare essence of its absurdity This was his habit as a controversialist, and, when his purpose was simply to convey information, to give the gist of a book of travels, or a system of education, or a body of statistics, he was unequalled in the art of amusing the reader with ludicrous images in the most unexpected places without departing from the main lines of a most clear, orderly, and instructive exposition The fact is that the serious didactic purpose in all Sydney Smith's writing and the closeness of his adherence to the matter in hand are the main obstacles to the living permanence of his fame as the writer of the best colloquial prose of his generation, for though his range of topics was wide—political, ecclesiastical, educational, geographical, and otherwise miscellaneous—they were all of immediate, practical, and passing interest, and his remarks were pushed home to the life of the time so closely as to have comparatively little independent interest for posterity

Most of Sydney Smith's contributions to the *Edinburgh Review* were sent from the country parish of Foston-le-Clay in Yorkshire, where he spent the best part of his life He left Edinburgh for good in 1803, when the education of his pupils was completed, and, yielding to his wife's confidence in his powers—he had married Miss Pybus, an English lady of good family, while still unsettled in life—adventured on London, where he rapidly became known as a preacher, a lecturer, and a social lion His success as a preacher, although so marked that there was often not standing room in the church in Berkeley Square, where he conducted the morning service, was not gained by any sacrifice of dignity there was no eccentricity, nothing sensational in his preaching, it was a pure triumph of good sense, right feeling, earnestness, and freshness of pulpit oratory He lectured on moral philosophy at the Royal Institution for three seasons, from 1804 to 1808, and here also, handling the ordinary topics of a philosophy chair in a Scotch university, he treated them with such vigour, freshness, and liveliness of illustration that the London world crowded to Albemarle Street to hear him He made no pretence to originality, and in the main followed Dugald Stewart, whose lectures he had attended in Edinburgh, but there is more originality as well as good sense in his lectures, especially on such topics as imagination and wit and humour, than in many more pretentious systems of philosophy With the brilliant reputation that Sydney Smith had acquired in the course of a few seasons in London, he would probably have obtained some good preferment had he been on the powerful side in politics His Whig friends came into office for a short time in 1806, and presented him with the living of Foston-le-Clay in Yorkshire He shrank from this banishment for a time, and discharged his parish duties through a curate, but Mr Perceval's Residence Act was passed in 1808, and, after trying in vain to negotiate an exchange, he quitted London in 1809 and moved his household to Yorkshire His most famous single production, *Peter Plymley's Letters* on the subject of Catholic emancipation, ridiculing the opposition of the country clergy, appeared

before this migration From being the idol of London society to being the pastor of a country parish with no educated neighbour within 7 miles was a violent change, but Sydney Smith accommodated himself cheerfully to his new circumstances, and won the hearts of his parishioners as quickly as he had conquered a wider world Not the least entertaining chapter in his daughter's biography of him is the account of his Yorkshire life An interesting contrast might be drawn between it and Carlyle's life in somewhat similar circumstances at Craigenputtock Sydney Smith's life at Foston, with its cheerful energy and ingenuity, its vigorous jesting at difficulties and eccentric ways of conquering them, is of much better example, and moralists might do worse than put the story into form for general edification [1]

Sydney Smith, after twenty years' service in Yorkshire, obtained preferment at last from a Tory minister, Lord Lyndhurst, who presented him with a canonry in Bristol cathedral in 1828, and afterwards enabled him to exchange Foston for the living of Combe Florey near Taunton From this time he discontinued writing for the *Edinburgh Review* on the ground that it was more becoming in a dignitary of the church to put his name to what he wrote It was expected that when the Whigs came into power Sydney Smith would be made a bishop There was nothing in his writings, as in the case of Swift, to stand in the way, for with all his humour and high spirits he had always, as he said himself, fashioned his manners and conversation so as not to bring discredit on his reverend profession He had been most sedulous as a parochial clergyman Still, though he was not without warm friends at headquarters, the opposition was too strong for them One of the first things that Lord Grey said on entering Downing Street was, "Now I shall be able to do something for Sydney Smith", but he was not able to do more than appoint him to a prebendal stall at St Paul's in exchange for the one of inferior value he held at Bristol Lord Melbourne is reported to have said that there was nothing he more regretted than the not having made Sydney Smith a bishop Some surprise must be felt now that Sydney Smith's reputation as a humourist and wit should have caused any hesitation about elevating him to the episcopal dignity, and perhaps he was right in thinking that the real obstacle lay in his being known as "a high-spirited, honest, uncompromising man, whom all the bench of bishops could not turn upon vital questions" With characteristic philosophy, when he saw that the promotion was doubtful, he made his position certain by resolving not to be a bishop and definitely forbidding his friends to intercede for him This loss and the much more painful loss of his eldest son did not destroy the cheerfulness of his later life He retained his high spirits, his wit, practical energy, and powers of argumentative ridicule to the last His *Letters to Archdeacon Singleton* on the Ecclesiastical Commission (1837), and his *Petition* and *Letters* on the repudiation of debts by the State of Pennsylvania (1843), are as bright and trenchant as his best contributions to the *Edinburgh Review* Smith died in London on 22d February 1845

Lady Holland's *Memoir* of her father, containing such specimens of his table talk as give one some idea of his charm and worth as a mirthful companion and philosopher, is one of the most interesting of biographies A cheap edition of his *Works* was published in 1869 (W M)

SMITH, SIR THOMAS (1512-1577), the contemporary and friend of Sir John Cheke, was born at Saffron-Walden in Essex in 1512 He became a fellow of Queens' College, Cambridge, in 1531, and was afterwards appointed to read the public Greek lecture, in the discharge of which function he first introduced the new Greek pronunciation, which soon became universal in England After studying in France and Italy and taking a degree in law at Padua, he was appointed first regius professor of civil law in Cambridge in 1542 During Somerset's protectorate he entered public life and was sent as ambassador first to Brussels and afterwards to France In 1548 he was made a secretary of state and knighted On the accession of Mary he was deprived of all his offices, but in the succeeding reign was frequently employed in public affairs He died in 1577

His best-known work, entitled *De Republica Anglorum the Maner of Government or Policie of the Realme of England*, was published posthumously in 1583, and passed through many editions His epistle to Gardiner, *De recta et emendata linguæ Græcæ pronunciatione*, was printed at Paris in 1568, the same volume includes his dialogue *De recta et emendata linguæ Anglicanæ scriptione*

SMITH, WILLIAM (1769-1839), called "the father of English geology," and among his acquaintances "Stratum Smith," will be generally remembered as the framer and author of the first complete geological map of England and Wales, and as the discoverer of the principle of the identification of strata by their included organic remains He was born at Churchill in Oxfordshire on 23d March 1769 Deprived of his father, an ingenious mechanic, before he was eight years old, he depended upon his father's eldest brother, who was but little pleased with his nephew's love of collecting "pundibs" (*Terebratulæ*) and "pound-stones" or "quoit-stones" (large *Echinites*, frequently employed as a pound weight by dairywomen), and had no sympathy with his propensity for carving sundials on the soft brown "oven-stone" of his neighbourhood William became a mineral surveyor and civil engineer In the former capacity he traversed the Oolitic lands of Oxfordshire and Gloucestershire, the Lias clays and red marls of Warwickshire, and other districts, studying their varieties of strata and soils In 1791 he surveyed an estate in Somersetshire and observed the strata of the district In 1793 he executed the surveys and completed the levellings for the line of a proposed canal, in the course of which he confirmed a previous supposition, that the strata lying above the coal were not horizontal, but inclined in one direction—to the eastwards—so as to terminate successively at the surface, and to resemble on a large scale the ordinary disposition of the slices of bread and butter on a breakfast plate—an illustration which he was wont to use on all occasions

On being appointed engineer to the Somerset Coal Canal in 1794, he was deputed to make a tour of observation with relation to inland navigation During this tour, which occupied nearly two months, and extended over 900 miles, he carefully examined the geological structure of the country, and corroborated his preconceived generalization of a settled order of succession in the several strata, a continuity of range at the surface, and a general declination eastwards Five years subsequently he prepared a tabular view of the *Order of the Strata, and their embedded Organic Remains, in the neighbourhood of Bath, examined and proved prior to 1799* From this period to 1812 he was completing and arranging the data for his large *Geological Map of England and Wales, with part of Scotland*, which appeared in 1815, in fifteen sheets, engraved on a scale of 5 miles to 1 inch The map was reduced to smaller form in 1819, and from this date to 1822 separate county geological maps were published in successive years, the whole constituting a *Geological Atlas of England and Wales* In January 1831 the Geological Society of London conferred on Smith the first Wollaston medal, and the Government, at the request of several English geologists, conferred upon him a life-pension of £100 per annum The degree of LL D he received from Dublin, at the meeting of the British Association in that city in 1835. At such meetings he was nearly always

[1] See Lady Holland's *Memoir*, chaps v, vi Lady Holland, Sydney Smith's eldest daughter, was the wife of Sir Henry Holland, the famous physician,—not of Lord Holland, as is sometimes absurdly stated

present In 1838 he was appointed one of the commissioners to select building stone for the new Houses of Parliament The last years of his life were spent at Hackness (of which he made a good geological map), near Scarborough, and in the latter town His usually robust health failed in 1839, and on 28th August of that year he died at Northampton He once said he was born on the Oolite, and should wish to be buried on it, and so he was, at Northampton

His *Memoirs* by Professor John Phillips appeared in 1844

SMITH, WILLIAM HENRY (1808-1872), best known as the author of *Thorndale*, is one of those thinkers and students whose work, whilst scarcely recognized in their own day and soon all but overlooked in the larger perspective of history, is yet of real value for an appreciation of the intellectual character of the time The literary production of which *Thorndale* is the most representative example affords a moral countenance to contemporary workers in philosophy which is invaluable, but which for obvious reasons can never be exactly appraised With a fine and reflective, rather than robust and active, intelligence, Smith deals suggestively in the form of conversation—which he adopts in *Thorndale* and in his later book *Gravenhurst*—with the problem of good and evil, with materialism and idealism, with most of the subtle modern perplexities in the interaction of religion, philosophy, and science But his more exact contributions to thought, such as the *Discourse on the Ethics of the School of Paley* and the *Essays on Knowing and Feeling*, do not work out anything like a complete system, and are somewhat lacking in intellectual grip Smith also wrote several books of verse and two plays, one of which, *Athelwold*, was produced by Macready in 1842 Much graceful reflexion and a true feeling for nature are found in his verse, but it lacks energy Smith spent a serene uneventful life, chiefly in the studious seclusion which he loved, but which must have tended to foster the inactive tendencies that led him to call himself playfully in his latter days "the snail" He was born at Hammersmith in 1808 in comfortable surroundings, his father being a retired merchant, his mother was of German extraction, with a vein of mysticism, which is worth noticing in view of the son's metaphysical tendencies He was sent in 1821 to Glasgow, where Byron's poetry and Scottish metaphysics seem to have had most influence upon him Then he entered a lawyer's office, in which he remained for five years His first writings appeared in the *Literary Gazette* and in the *Athenæum*, to which he contributed under the name of "Wool-gatherer," attracting some attention by the delicacy and finish of his style His ambition was at the outset chiefly poetical, however, and, when his first book appeared and was almost completely ignored, he dug a grave and buried the unsold copies in a fit of Byronic despondency *Ernesto*, a philosophical romance, also belongs to this early period In 1836 he wrote for the *Quarterly Review*, and in 1839 he formed a connexion with *Blackwood's Magazine*, which lasted for thirty years, during the latter part of which he acted as its philosophical critic In 1846 a visit to Italy led to the writing of a tale entitled *Mildred*, which was too purely reflective to be successful In 1851 he declined the chair of moral philosophy at Edinburgh, having determined a year or two previously to retire to the English Lake district, there to study in seclusion There he completed *Thorndale*, which was published in 1857 *Gravenhurst* appeared in 1862, a second edition contained a memoir of the author by his wife He died at Brighton on 28th March 1872

SMITH, SIR WILLIAM SIDNEY (1764-1840), English admiral, was the second son of Captain John Smith of the Guards, and was born at Westminster on 21st July 1764 He entered the navy, according to his own account, "at the beginning of the American War," being only about eleven years of age For his bravery under Rodney in the action near Cape St Vincent in January 1780, he was on 25th September appointed lieutenant of the "Alcide" After serving in the actions against the French fought by Graves off Chesapeake in 1781 and by Rodney at the Leeward Islands in 1782, he was on 6th May of the latter year promoted to be commander of the "Fury" sloop, and on 18th October advanced to the rank of captain His ship having been paid off in the beginning of 1784, he spent two years in France and afterwards visited Spain From 1790 to 1792 he was employed in advising the king of Sweden in the war with Russia, receiving for his services the honour of knighthood After his return to England he was sent on a mission to Constantinople, and, having joined Lord Hood at Toulon from Smyrna in December 1793, he burnt the enemy's ships and arsenal In the following years he cleared the Channel of French privateers, but, having with the boats of his squadron boarded in Havre-de-Grâce harbour a lugger which was driven by the tide above the French forts, he was on 19th April 1796 compelled to surrender and sent a prisoner to Paris By means of forged orders for his removal to another prison he made his escape from the Temple, and, crossing the Channel in a small skiff picked up at Havre, arrived in London on 8th May 1798 In October he was sent as plenipotentiary to Constantinople Learning of Buonaparte's approach to St Jean d'Acre, he hastened to its relief, and on 16th March 1799 captured the enemy's flotilla, after which he successfully defended the town against several furious attacks of the French, compelling Napoleon on 20th May to raise the siege and retreat in disorder, leaving all his artillery behind For this brilliant exploit he received the special thanks of the Houses of Parliament and was awarded an annuity of £1000 Subsequently he co-operated with Abercromby, under whom he served as brigadier-general at the battle of Aboukir, where he was wounded On his return to England he was in 1802 elected M P for the city of Rochester In March 1803 he was commissioned to watch the preparations of the French for an invasion of England Having on 9th November 1805 been promoted to be rear-admiral of the blue, he was in the following January despatched on secret service for the protection of Sicily and Naples He relieved Gaeta and captured Capri, but on 25th January 1807 received orders to proceed to Malta, whence he joined Sir John Duckworth, who was sent to act against the Turks On 7th February, with the rear division of the squadron he destroyed the Turkish fleet and spiked the batteries off Abydos In November following he was sent to blockade the Tagus and was mainly instrumental in embarking the Portuguese prince regent and royal family and sending them under safe protection to Rio de Janeiro, after which he was sent as commander-in-chief to the coast of South America On 31st July 1810 he was made vice admiral of the blue and on 18th July 1812 was despatched as second in command under Sir Edward Pellew to the Mediterranean, but the expedition was uneventful His term of active service practically closed in 1814 He was made K C B in 1815 and in 1821 admiral The later years of his life were spent at Paris, where he died on 26th May 1840

See Barrow's *Life of Admiral Sir W S Smith*, 2 vols, 1848

SMOKE ABATEMENT The nuisance created by coal smoke seems to have been recognized in London as early as the reign of Queen Elizabeth, but it is only in more modern times that the question has come to be regarded as one of real practical importance, and even yet it is far from receiving that general attention which it demands History

In 1785 the first smoke-abating invention was patented by James Watt, who, as the inventor of the steam-engine, is responsible for so many boiler fires and so much consumption of coal. In 1815 Cutler patented the first would-be smokeless grate for domestic purposes, and his principle of feeding underneath was afterwards adopted by Dr Neil Arnott in a grate which has now been in use in one form or another for more than half a century. There is now a vast number of such inventions, good and bad. In 1819 the attention of parliament was directed to the question, and a select committee was appointed "to inquire how far persons using steam-engines and furnaces could erect them in a manner less prejudicial to public health and comfort." This committee gave an encouraging report. In 1843 another select committee recommended the introduction of a bill prohibiting the production of smoke from furnaces and steam-engines. In 1845 yet another select committee reported that such an Act could not in the existing state of affairs be made to apply to dwelling-houses. The Acts of 1845 and 1847 followed as the results of these inquiries, and since then there has been much legislation brought to bear on factories and railways. The results have been most beneficial, but very much still remains to be done. One is apt to think that, because steam-engines and factories consume individually much more coal than dwelling-houses, they alone are responsible for the smoke nuisance, forgetting how greatly the dwelling-houses outnumber the factories. In reality there is little doubt that domestic fires are mainly responsible for the smoky condition of the atmosphere of our towns, and they for the most part continue to evolve smoke undeterred by legislation or scientific invention. In 1881, however, a movement was commenced by the National Health Society and the Kyrle Society, which resulted in a great smoke-abatement exhibition being held at South Kensington. At the close of the exhibition a national smoke-abatement institution, with offices in London, was incorporated by authority of the Board of Trade.

Combustion of coal. A knowledge of the nature of coal and of the chemical changes that it undergoes when burnt is essential for an understanding of the smoke problem. More detailed information on these points is given under COAL, where the several varieties are described. For the purposes of this article coals may be classified as smoke-producing and smokeless, the former including all those varieties most commonly used as fuel. The elementary constituents of such coals are carbon (generally about 80 per cent. of the whole), hydrogen, nitrogen, oxygen, and sulphur, and they also contain a varying quantity of earthy impurity or ash. The process which occurs in a coal fire consists of two distinct operations. The first, which requires a comparatively low temperature and is independent of the presence of air, is one of destructive distillation, and is similar to that which occurs in the retorts of gasworks. It results in the decomposition of the coal, and in the rearrangement of its constituent elements and the formation of the following substances:—(1) hydrogen, marsh gas, carbonic oxide, olefiant gas, benzine, other hydrocarbons of the type of marsh gas or of benzine, water,—all of which are either gaseous at the temperature at which they are formed or capable of being converted into gas at somewhat higher temperatures, and all of which are combustible except the water; (2) ammonia and other compounds of nitrogen, and certain compounds of sulphur, which are also volatile and combustible; (3) coke, which consists of carbon (and ash) and is non-volatile but combustible. It is these products of distillation, not the coal itself, that burn, in the strict sense of the word; and this second process requires the presence of air and also a much higher temperature than the first. If the combustion is perfect, the only products are (1) water-vapour, (2) carbonic acid, (3) nitrogen, and (4) sulphurous acid, the first of which contains all the hydrogen originally present in the coal, the second all the carbon, the fourth all the sulphur, while the nitrogen is liberated as such together with the very much larger volumes of nitrogen derived from the air which has supplied the necessary oxygen. All these products of combustion are discharged through the chimney.

Two things are necessary for the ensuring of such complete combustion, viz., an adequate, but not too large, supply of air, properly administered, and the maintenance of the requisite temperature. In practice, however, these conditions are never perfectly fulfilled, and consequently the combustion of coal is always more or less imperfect and gives rise to a complex mixture of vapours. This mixture contains not only the combustion products already mentioned but also the following unburnt or partly burnt distillation products:—(5) hydrogen, (6) hydrocarbons, (7) carbonic oxide, which contains a lower proportion of oxygen than carbonic acid, (8) unburnt carbon in a very finely divided state,—and also considerable volumes of unused air.

Usually the name "smoke" is applied to this vaporous mixture discharged from a chimney only when it contains a sufficient amount of finely divided carbon to render it dark-coloured and distinctly visible. Smoke. The quantity, however, of this particular ingredient is apt to be overrated. It always bears an extremely small proportion to the vast volumes of water-vapour, carbonic acid, and nitrogen with which it is mixed; it probably never amounts, even in the worst cases, to 3 per cent. of the weight of the coal from which it is formed; and its importance, reckoned in terms of so much fuel wasted, is certainly not greater than that of the unburnt hydrogen and hydrocarbons. It is perhaps best to use the name "smoke" for all the products of imperfect combustion (5 to 8) which are avoidable, as contrasted with the necessary and unavoidable ingredients (1 to 4) of the mixture. The problem of smoke abatement is thus seen to resolve itself into the problem of the production of perfect combustion.

Advantages of efficient smoke abatement. The first advantage to be gained by the solution of this problem is an important saving in fuel. It has been calculated that at least twice as much coal is used in boiler fires and six times as much in domestic fires as is theoretically required for the production of the effects obtained. A considerable portion of this loss is due to causes other than those that can be treated of here, and some is certainly unavoidable; but there is no doubt that much of this enormous waste could be prevented by improved methods of combustion, such as would solve the smoke problem. The second advantage to be looked for is a great gain in cleanliness and public convenience. Not only would there be an end to sooty chimneys but the atmosphere of towns would no longer be polluted as it is now by the discharge of unburnt carbon, whose total quantity is enormous, though the amount contained in any given puff of smoke is very small. The "London fog" would be a thing of the past,—not because fogs would become any less frequent than now in London and other large cities, but because they would lose their distinctive character of grimy opacity. It is often stated that these fogs are *caused* by the smoke that blackens them; but this is an error. The combustion of coal is certainly responsible for their existence, but it is the sulphur of the coal (oxidized ultimately to sulphuric acid), and not the carbon, that is the active agent. And so long as coal is burnt at all this manufacture of sulphuric acid and of fogs must continue; it is not to be got rid of by improved methods of combustion, though the character of the fogs may be materially altered for the better. The evil effects of town

air on plant life and human lungs, also often attributed to preventible smoke, are in like manner due to this non-preventible sulphuric acid. The great gain in cleanliness, however, that would follow the abolition of smoke cannot be overrated.

Methods of smoke abatement. The methods that have been suggested for the abolition of smoke may be divided into two great classes, viz., those that seek to attain this end by improving the appliances for the burning of bituminous coal, and those that propose to abolish its use and substitute for it some other kind of fuel. The proposals of the first class may be divided into those applicable to domestic purposes and those applicable to boiler fires and other large-scale operations. Those of the second class may be divided according to the nature of the fuel which they suggest. The innumerable inventions of the first class depend for their success (so far as they are successful) on the attention bestowed on the scientific requisites for complete combustion, viz., a sufficient but not too great supply of air, the thorough admixture of this air with the products of the destructive distillation of the coal, and the maintenance of a high temperature within the fire. In our old and crude methods the facts which most militate against the attainment of these desiderata are—(1) that large masses of fresh fuel are continually being thrown on at the top, which cool down the fire just at that point where highest temperature is required; (2) that the products of the distillation of this fresh fuel, heated from below, do not get properly mixed with air till they have been drawn up the chimney; (3) that unduly large volumes of cold air are continually being sucked up through the fire, cooling it and carrying its heat away from where it is wanted, and yet without remedying the second evil. In the improved methods regularity of supply of both fuel and air is sought so as to maintain a steady evolution of distillation products, a steady temperature, and a steady and complete combustion. In many cases it is sought to warm fresh air before it enters the room by a regenerative system, the heat being taken from the escaping gases which would otherwise carry it up the chimney, and in some cases the air which feeds the fire is heated in the same way.

Domestic stoves and grates—tests. We cannot here discuss the merits of individual inventions; but we may summarize the chief results of the tests applied at the South Kensington Exhibition. These tests, for domestic grates and stoves, included a chemical examination of the chimney gases, observations of the "smoke-shade" as indicating the proportion of unburnt carbon, and a record of the amount of coal burnt, of the rise of temperature produced, of the radiation, and of the amount of heat lost by being carried away through the chimney. Domestic grates and stoves were divided into six classes as follows:—(1) open grates having ordinary bottom grids and upward draught; (2) open grates having solid floors (adapted for "slow combustion") and upward draught; (3) open grates fed from below,—supplied with fresh fuel beneath the incandescent fuel; (4) open grates fed from the back or from the sides or from hoppers; (5) open grates having downward or backward or lateral draught; (6) close stoves. Each of these classes was subdivided according as the apparatus was "air-heating" or "non-air-heating," *i.e.*, according as an attempt was or was not made to save heat on the regenerative principle. This attempt does not appear to have been distinctly successful in any class except the fifth; indeed the evidence of the tests as a whole is rather against the air-heating principle. The following table gives the average results of tests for each class and sub-class as regards general rise of temperature and radiation per pound of coal and smoke-shade. The figures under the last head refer to a standard of shades ranging from 0 (smoke imperceptible) to 10 (black and dense). It was found in practice that the results of this smoke-shade test were in general accord with those of the chemical examination of the chimney gases. The letters "a" and "n" in the first column signify air-heating and non-air-heating respectively, the average results for the whole class being given before those for each sub-class. All the experiments were made with Wallsend coal, a fair representative of the bituminous coals.

Class	No. of appliances tested	Average rise of temp. per lb. of coal per hour, in degrees Fahr.	Average radiation per lb. of coal per hour, in degrees Fahr.	Average smoke-shade
1	19	2·88	3·58	3·01
„ a	9	3·37	2·88	3·22
„ n	10	2·45	4·21	2·78
2	12	2·99	4·07	3·23
„ a	2	2·81	3·93	4·11
„ n	10	3·02	4·09	3·09
3 n	5	3·81	3·61	2·82
„ a	none			
4	6	3·05	3·14	2·66
„ a	2	2·41	2·42	2·23
„ n	4	3·37	3·50	2·88
5	18	3·38	3·70	2·73
„ a	11	3·45	4·00	2·29
„ n	7	3·28	3·22	3·21
6	10	4·14	1·66	2·11
„ a	2	3·79	1·78	1·58
„ n	8	4·23	1·64	2·25
1-5 (total average)	60	3·22	3·62	2·89

From this table the following facts, among others, may be deduced:—(*a*) the air-heating principle has not been applied with success except in class 5; (*b*) close stoves (class 6) are superior to open grates (total average of classes 1-5) in respect of freedom from smoke and of general heating effect, but they are greatly inferior in radiating power,—a deficiency which partly explains their unpopularity in the United Kingdom; (*c*) the "slow-combustion" principle gives a high radiation factor, but is otherwise not successful; (*d*) the class of air-heating grates with downward, backward, or lateral draughts is, on the whole, most efficient.

Boiler fires. Much attention has been devoted for many years to the question of how to work boiler fires, both for locomotives and for fixed appliances, with the least possible production of smoke and the greatest possible evaporative power. Here the desiderata are essentially the same as in the case of domestic fires, viz., adequate admixture of the combustible vapours given off by the coal with the necessary air and the maintenance of a high temperature; and the principles involved are consequently also the same, though the appliances are necessarily different. These improvements may be all classed under one or other of two heads, according as the mode of supplying the fuel or the mode of supplying the air is the subject of the improvement. These two kinds of improvement may of course be combined. The article Furnace may be consulted; see also Steam-Engine, sect. "Boilers."

Mechanical stokers. In the old forms of furnace fresh fuel, as it is wanted, is supplied by hand labour, the furnace doors being opened and large quantities of coal thrown in. One result of this is the inrush of great volumes of cold air, which, aided by the equally cold fuel, lowers the general temperature of the furnace. Mechanical stokers meet this difficulty by supplying the coal regularly in small quantities at a time. They may be divided into those which deliver the coal at the front and gradually push it backward, those which scatter it generally over the surface of the grate, and those which raise it from below so that the products of its distillation pass through the already incandescent fuel. The mechanism by which these results are attained is often of a complex nature.

Air-supply. It is generally recognized that air cannot be efficiently

supplied to the furnace if admitted only in front, and accordingly there have been many plans devised for supplying it also at the back. In some cases currents of air are induced by steam-jets; but this plan has not proved very successful. The best inventions are on the regenerative principle. In them the air, before entering the furnace, is made to circulate through chambers heated externally by the products of combustion, and, having thus acquired a high temperature and absorbed heat that would otherwise have been lost, is admitted through openings at the bridge. Many of these appliances are almost absolutely smokeless, and they are much in use.

Substitutes for bituminous coal.

The advocates of the total or partial disuse of smoke-producing coals are variously in favour of the following substitutes—anthracite, coke, liquid fuel, and gas.

Anthracite.

For some purposes anthracite and other coals containing a high percentage of carbon may be, and have long been, advantageously used as fuel. They yield a much smaller percentage of distillation products than ordinary coals, and produce no smoke, or almost none. But they are difficult to ignite, and in small fires difficult to keep burning; they give very little flame, and are comparatively expensive, so that they are under considerable disadvantage as compared with the usual kinds of coal. Many of the grates and stoves exhibited at South Kensington were specially devised for burning anthracite, and some of them are decidedly successful; but it is not likely that anthracite will ever take the place of bituminous coal to any great extent in the British Isles. There the great coal-fields undoubtedly are the natural sources of fuel, and no proposal involving a complete neglect of this fact can ever be successfully carried out.

Coke.

This remark, however, does not apply to the use of coke and of gas, which are themselves made from coal. Coke is produced in large quantities both for its own sake and as a bye-product in the manufacture of gas for lighting purposes, and is largely used in various kinds of furnace. It gives no smoke; but it resembles anthracite also in being but ill adapted to use in open grates on account of the difficulty of ignition and the absence of flame (see FUEL).

Liquid fuel.

In America, where natural petroleum is obtained in such enormous quantities, the experiment has been made of using it as the source of heat for boilers. A jet of superheated steam (at about 600° Fahr.) is blown into the hot combustion chamber and the oil and air enter mixed with it. The results are said to be excellent,—the fire smokeless and the efficiency high. The residue from coal-tar, after the naphtha and light oils have been recovered from it, can also be advantageously used in this way. The chief disadvantage attending the use of liquid fuels such as petroleum seems to lie in the fact that they are somewhat dangerous, fatal accidents having occurred in America; and the range of their application is necessarily limited. To use them for the heating of houses is of course quite out of the question.

Gaseous fuel.

Of all the schemes and inventions for the abatement of smoke that one which proposes to distil coal in one operation, and to burn the products of the distillation in another and quite separate operation, is without doubt the most thoroughly scientific; and to it, rather than to patent grates and furnaces, we must look for the ultimate solution of the question. Many arguments may be adduced in favour of gas-heating as opposed to coal-heating, the most important of which are here briefly given. (1) Coal gives, on distillation, not only gas and coke, which are both good heating agents, but intermediate products, many of which are of commercial value; these include ammonia, benzine, carbolic acid, anthracine, &c. As science advances the value of coal-tar will probably be enhanced by further discoveries; already it gives the raw material for the preparation of numberless beautiful dyes, of antiseptics, and of some drugs, and quite lately a substance described as an admirable substitute for sugar has been prepared from it. All these intermediate products are now, according to our barbarous methods of burning coal, used simply as fuel. (2) Gas can be laid on in pipes to any spot, can be lit or turned out at any moment, and can be so managed that less heat is frittered away and more applied to the specific object than in the case of coal-burning. (3) It produces no smoke and leaves no ash or cinder, so that cleanliness is attained and much labour and expense are saved. (4) The coke produced during the preparation of the gas has uses of its own as solid fuel and for other purposes. (5) As has been already said, sulphur is an ingredient of all coals, and sulphuric acid is one of the necessary results of burning them, not to be got rid of by "smoke abatement." Coal gas, however, can to a great extent be freed from sulphur compounds, and it is possible that the purification methods in vogue may hereafter be improved, so that we have here a means, if any exist, of curing the chief evils of our present system,—injury to our respiratory organs, production of fogs, and destruction of vegetation in towns. The principal disadvantage of the proposal is to be found in the high cost of coal gas, which now varies generally from 3s. to 4s. per 1000 cubic feet, whereas it has been calculated that it would have to cost not more than 1s. or at most 1s. 6d. to compete successfully with coal. There is no doubt, however, that the cost might, and it probably will, be brought down to this, as the high rate is due to causes not inherent in the nature of things. Sir William Siemens proposed that two sets of mains should be laid in English towns, one for heating and one for lighting gas, and showed that the first and last portions of every preparation of gas are possessed of very low illuminating power, but if collected apart would do excellently for heating purposes, while the rest would be improved for lighting. It is probable, however, that electricity will ultimately drive gas out of the field as an illuminating agent and that it will then be relegated to its true place as a heating agent. When that is done coal will no longer be burnt as a whole, but only those of its products (gas and coke) which are good for heating and for nothing else.

Meanwhile, ordinary coal gas has already, expensive as it now is, been largely applied to certain purposes, notably to cooking stoves and other domestic requirements, to gas engines (in which the generation of steam is unnecessary), and to bakers' ovens; and these inventions are calculated materially to diminish the smoke nuisance. In order to obtain an economical gas capable of being generated on the spot and used for operations on a large scale, Sir W. Siemens devised a gas-producer in which coal is partially burnt in a limited atmosphere and is wholly converted into gaseous products (chiefly carbonic oxide), only the ash being left. This "producer-gas" is a weak fuel, being largely diluted with atmospheric nitrogen, and is therefore inapplicable to domestic purposes; but for many others it suits admirably, one of the best examples of its application being Siemens's own regenerative gas furnace for melting steel (see SIEMENS). Other gas-producers have been patented, and the cost of the gas so made is as low as 4d. per 1000 cubic feet, or even less. It is probably, however, but a temporary substitute for true coal gas. In the use of this latter we shall, without doubt, find the true scientific solution of the smoke-abatement problem. As an example of what gaseous fuel can do, it may be mentioned that in Pittsburgh in Pennsylvania the furnaces are now being fed by natural oil gas and that that city, once one of the dirtiest of manufacturing towns, is becoming one of the cleanest.

Barr, *Practical Treatise on the Combustion of Coal* (Indianapolis, 1879); *Official Report of the Smoke-Abatement Committee* (London, 1882); *Smoke Abatement Exhibition Review* (London, 1882); and papers and discussions in the *Journal of the Society of Chemical Industry*, 1881 and following years. (O. M.)

SMOLENSK, a government of middle Russia, belonging partly to Great Russia and partly to White Russia, is bounded by Moscow and Kaluga on the E., Orel and Tchernigoff on the S., Moghileff and Vitebsk on the W., and Pskoff and Tver on the N. It covers an area of 21,638 square miles in the west of the great central plateau, its northern districts extending towards the hilly region of the Valdais, where the flat-topped gentle declivities reach about 1000 feet above the sea. The rivers being deeply cut in the plateau, the surface is also hilly in the western districts (Smolensk, Dorogobuzh), whence it slopes away gently towards immense plains on the east and south. Carboniferous limestones, containing a few layers of coal (in Yuchnoff) and quarried for building purposes, occupy the east of Smolensk; white Chalk appears in the southern extremity, while Tertiary sands, marls, and ferruginous clays cover all the west. The whole is overlain with a thick sheet of boulder clay, with irregular extensions to the north; Post-Tertiary sands are spread over wide surfaces, and peat-bog fills the marshy depressions. The soil, mostly clay, is generally unfertile, and stony and sandy in several districts. Many large rivers belonging to the basins of the Volga, the Oka, the Dnieper, and the Dwina have their origin in Smolensk. The Vazuza and the Gzhat, both flowing into the Volga, and the Moskva and the Ugra, tributaries of the Oka, are channels for floating timber. The two tributaries of the Dwina—the Kasplya and the Mezha—are of much more importance, as they and their affluents carry considerable numbers of boats to Riga. The Dnieper takes its origin in Smolensk and waters it for more than 300 miles; but neither this river nor its tributaries (Vop, Vyazma, Sozh, and Desna), whose upper courses belong to Smolensk, are navigable; timber only is floated down some of them. Many small lakes and extensive marshes occur in the north-west. One-third of the area is under forests. The population of Smolensk reached 1,191,172 in 1882, of whom only 106,133 lived in towns, and consists of White Russians in the west (16.7 per cent.), Great Russians in the east (42.6), and of a mixed population of both (10.4). Nearly 1000 Jews and 1000 Poles are scattered through the towns.

The climate is like that of middle Russia generally, although the moderating influence of the wet climate of western Europe is felt to some extent. The average yearly temperature at Smolensk is 45°.5 Fahr. (January, 13°.5; July, 67°.2). Notwithstanding the unproductive soil and the frequent failures of crops (especially in the north-west), the chief occupation is agriculture. In 1884 3,040,000 acres were under crops, and 2,379,600 quarters of grain of various kinds were raised (2,930,400 in 1883),—the potato crop yielding 5,498,400 bushels. Nearly all the land is cultivated by the peasant communes,—only 766,500 acres (out of 6,868,900) in the hands of single individuals being under cultivation. Oats are an important crop. Hemp and flax are largely raised and exported. Cattle breeding stands at a low level; the cattle of the peasantry suffer from a want of meadow and pasture land, which is mostly in private ownership. In 1882 there were 329,850 horses, 349,000 horned cattle, 401,000 sheep, and 162,000 pigs. The peasantry are mostly very poor, in consequence not only of the desolation inflicted on Smolensk in 1812, the effects of which are still felt, but also of insufficient allotments and want of meadows. Gardening and bee keeping, which formerly flourished, have almost disappeared. The timber trade and boat-building are important sources of income, but do not furnish employment for all who are in need of it; more than one-half of the male population of west Smolensk leave their homes every year in search of work, principally as navvies throughout Russia. The manufactures are developing but slowly, and in 1882 employed only about 5100 workmen,—their annual production being valued at £328,800; of this amount the distilleries yielded nearly one-third. A few cotton-mills in the east have a production valued at £62,160 per annum. A lively traffic is carried on on the rivers, principally the Kasplya, the Obzha, and the Ugra, where corn, hemp, hempseed, linseed, and especially timber are shipped to the amount of nearly £400,000 annually. A considerable quantity of corn is imported into the western districts. Smolensk is crossed by two important railways, from Moscow to Warsaw and from Riga to Saratoff; a branch line connects Vyazma with Kaluga. The educational institutions embrace eleven gymnasia and progymnasia (830 boys and 1402 girls), and 394 primary schools (15,031 boys and 2142 girls). Smolensk is divided into twelve districts, the chief towns of which, with their populations in 1882, are—Smolensk (see below), Byelyi (7150), Dorogobuzh (8400), Duhovshina (3660), Elnya (4850), Gzhatsk (7050), Krasnyi (3550), Poryetchie (4650), Roslavl (9050), Sytchevka (5720), Vyazma (13,000), and Yuchnoff (3230).

SMOLENSK, capital of the above government, is situated on both banks of the Dnieper, at the junction of the railways from Moscow to Warsaw and from Riga to Orel, 262 miles by rail west-south-west of Moscow. The town, with the ruins of its old kremlin, is built on the high crags of the left bank of the Dnieper, its suburbs extending around and on the opposite bank of the river. Its walls are now rapidly falling into decay, as well as all other remainders of its past. The cathedral was erected in 1676-1772, on the site of a more primitive building (erected in 1101), which was blown up in 1611 by the defenders of the city. The picture of the Virgin brought to Russia in 1046, and attributed to St Luke, which is kept in this cathedral, is much venerated throughout central Russia. Two other churches, built in the 12th century, have been spoiled by recent additions. Smolensk is neither a commercial nor a manufacturing centre; its population was 35,830 in 1882.

Smolensk, one of the oldest towns of Russia, is mentioned in Nestor as the chief town of the Crivitchis, situated on the great commercial route "from the Varyaghs to the Greeks." It maintained a lively traffic with Constantinople down to the 11th century, when the principality of Smolensk included Vitebsk, Moscow, Kaluga, and parts of the present government of Pskoff. The princes of Kieff were often recognized as military chiefs by the *vyetche* (council) of Smolensk, who mostly preferred Mstislaff and his descendants, and Rostislaff Mstislavovitch became the head of a series of nearly independent princes of Smolensk. From the 14th century these last fell more and more under the influence of the Lithuanian princes, and in 1404 Smolensk was annexed to Lithuania. In 1449 the Moscow princes renounced their claims upon Smolensk; nevertheless this important city, which was both a stronghold and a commercial centre with nearly 100,000 inhabitants, was a constant source of contention between Moscow and Lithuania. In 1514 it fell under Russian dominion; but during the disturbances of 1611 it was taken by Sigismund III. of Poland, and it remained under Polish rule until 1654, when the Russians retook it; in 1686 it was definitively annexed to Russia. In the 18th century it played an important part as a basis for the military operations of Peter I. during his wars with Sweden. In 1812 it was well fortified, but the French took it, when it suffered much from conflagrations, and generally, during the war.

SMOLLETT, TOBIAS GEORGE (1721-1771), novelist, was born at Dalquhurn, in the valley of Leven, Dumbartonshire, in 1721. His buoyant humour and energy were the gifts of nature, and early experience furnished him with abundant provocation for the harsh and cynical views of human nature to be traced in his novels. At a very early age he was placed in a position calculated to harden the heart of a proud and sensitive child. His father, the youngest son of the laird of Bonhill, a Scottish legal dignitary, married against the ambition of his family, and died young, leaving three children, of whom the future novelist was the second son, entirely unprovided for. The boy, being thus left dependent on the charity of relatives, grudgingly and insolently bestowed, as it seemed to him, learned to look with suspicion on kindly professions. He seems to have received the ordinary book education of the place and period. He was sent to the neighbouring grammar-school of Dumbarton—taught at the time by one of the most eminent schoolmasters in Scotland—and thereafter to the university of Glasgow. He wished then to enter the army, as his elder brother had done, but much against his will was apprenticed to a surgeon. His

grandfather died when he was in his eighteenth year, without leaving any provision for the children of his youngest son, and in his nineteenth year Smollett left Glasgow and launched himself on London in quest of fortune with the tragedy of the *Regicide* in his pocket He failed to get the tragedy accepted, and, reduced almost to starvation, was fain to take the situation of surgeon's mate on board a ship of the line He was present in 1741 at the siege of Cartagena He soon quitted the navy in disgust, but during his service of a few years he acquired, as Scott says, "such intimate knowledge of our nautical world as enabled him to describe sailors with such truth and spirit of delineation that, from that time, whoever has undertaken the same task has seemed to copy more from Smollett than from nature"

Returning to England in 1746, Smollett made a desperate attempt to live by his pen, publishing the satires *Advice* and *Reproof*—satire being then in fashion—and pushing the *Regicide* and other dramatic works on theatrical managers and patrons He revenged himself in his satires for the rebuffs given to his plays Whether he was ever reduced to such straits as Mr Melopoyn, whom Roderick Random met with in the Fleet, is not known for certain, but it is certain that he was sharply pinched, and he did not mend his circumstances by marrying a portionless lady whom he had met in the West Indies His buoyant spirit was not in the least broken by adverse fortune, but it was considerably inflamed and embittered His fierce and distempered mood when he wrote *Roderick Random* is reflected in the characters of the novel, which are drawn with a much more defiant and contemptuous hand than he used in any of his subsequent works. The author was not a cold-blooded cynic, but a proud warm-hearted man enraged by what he considered unjust usage He was not in a mood to dwell upon lovable traits in human nature, or to find pleasure in pretty sentiments The public, however, when *Roderick Random* was published —in 1748, a few months before *Tom Jones*—did not concern themselves with the character of the author The wealth of humorous incident, the rapidly moving crowd of amusing figures, concealed all those harsher features in the picture of life which quiet reflexion can now trace to the circumstances of the author, smarting as he was under petty insults and real or fancied indignities This novel at once raised Smollett into reputation It was followed after an interval of three years by *Peregrine Pickle* (1751), the immediate popularity of which was helped by the insertion into the body of the novel of two stories from real life, the memoirs of a lady of quality (Lady Vane) and the memoirs of the philanthropist M'Kercher This second masterpiece was written with a much lighter heart than the first, although it must be confessed that the hero is not much of an improvement on Roderick Random Scott describes him as "the savage and ferocious Pickle, who, besides his gross and base brutality towards Emilia, besides his ingratitude to his uncle, and the savage propensity which he shows in the pleasure he takes to torment others by practical jokes, resembling those of a fiend in glee, exhibits a low and ungentlemanlike tone of thinking, only one degree higher than that of Roderick Random" There is, however, this difference, that the author seems much more conscious of the bad qualities of Pickle than of Random. He expends no sympathy or fine sentiment on either, but Random's defects are represented as the results of the harsh treatment he had himself received, while Pickle's appear rather as the outcome of a naturally harsh and insolent character Both are far from being model gentlemen, but Pickle is several degrees lower rather than one degree higher than Random In the second novel there is a still richer crowd of characters, quaint, amusing, disgusting, and contemptible, but there is more of a tendency to secure variety by extravagant caricature For some of the indecencies in the first edition Smollett apologized, and withdrew them in a second edition, but he still left enough to satisfy the greediest taste in that particular He also withdrew a very offensive allusion to Fielding, and in his next novel, *The Adventures of Ferdinand, Count Fathom*, paid that great rival the compliment of imitation Though Smollett was far from being a servile imitator, there can be no doubt that he profited greatly by Fielding's example in all the higher essentials of his craft This, his third effort, although it has not the same exuberant humour and fresh variety of character, is vastly better in point of constructive skill and sustained power of description It looks as if he had deliberately set himself to show that he too as well as the author of *Tom Jones* could make a plot The vileness of Fathom's character is so repulsive that the novel is much less often read than others of Smollett's, but it is his greatest feat of invention, being not a mere string of lively adventures, but a connected series in the progressive movement of the villain's career It contains some of Smollett's most cynical comments on human motives, as well as passages that illustrate strikingly his real goodness of heart He was not at home, however, in the direct expression of tender sentiment, when any of his persons gush, they do so with such wordiness and extravagance as to give them an air of insincerity

With the composition of *Count Fathom* in 1753 Smollett's invention seemed to be exhausted for the time For the next ten years he occupied himself with miscellaneous literary work, translating *Don Quixote* (published 1755), compiling a *Compendium of Voyages and Travels* (1757), and producing a *History of England from the Landing of Cæsar to the Treaty of Aix-la-Chapelle* (1757), followed by a continuation down to the date of publication (1761-65) Smollett, in short, from the time of his first success made his living as a professional man of letters He obtained a medical degree from a German university about 1752, and set up as a physician, but seems never to have acquired much practice He turned this experience to account, however, by caricaturing in *Count Fathom* the arts of rising in the profession He had very little more success in his attempts to write for the stage The *Regicide* was never acted, and, when it was published in 1749 to expose the folly of managers in not accepting it, the verdict of the public was rather with the managers than with the author Smollett's single success on the stage was a farce with a political object, *The Reprisals, or the Tars of Old England*, produced in 1757 to excite feeling against the French As a journalist also Smollett was not particularly successful, partly perhaps because he attached himself to the losing side,—the Tory and High Church party. He edited their organ *The Critical Review* for some years, and in 1759 suffered imprisonment for an attack on Admiral Knowles At the beginning of the reign of George III he supported Lord Bute's ministry in *The Briton*, but *The Briton* was driven out of the field by Wilkes's *North Briton* Altogether Smollett's revenue from play-writing and journalism seems to have been small, unless his party services were requited independently of the sale of his papers But his name stood high with booksellers He introduces himself in *Humphrey Clinker* as a dispenser of literary patronage, surrounded by a number of humble dependants. These were probably the hacks to whom he gave employment in his journals and in such booksellers' jobs as his translation of Voltaire and the compilation entitled *The Present State of all Nations, containing a Geographical, Natural, Commercial, and Political History of all the Countries of the Known World* (1763)

In the course of this hard miscellaneous task-work, under which Smollett's health gave way completely, he wrote by instalments for the *British Magazine* (in 1760 and 1761) the curious satirical romance of *Sir Lancelot Greaves*. It is only in externals that this work bears any resemblance to *Don Quixote*. The author seems to have hesitated between making Sir Lancelot a mere madman and making him a pattern of perfectly sane generosity. The fun and the seriousness do not harmonize. The young knight's craze for riding about the country to redress wrongs armed *cap-a-pie* is too harshly out of tune with the rightness of his sympathies and the grave character of the real abuses against which his indignation is directed. In execution the work is very unequal and irregular, but the opening chapters are very powerful, and have been imitated by hundreds of novelists since Smollett's time.

Upon the failure of his health in 1763 Smollett went abroad and lived in France and Italy for three years. He published two volumes of *Travels* soon after his return in 1766. Three years more he spent in England, trying in vain to get some consular post abroad, where the climate might suit his shattered constitution. His extremely clever and extremely coarse political satire, *The Adventures of an Atom*, published in 1769, was probably inspired partly by resentment at the neglect of his own claims by successive ministries. He left England soon after its publication, and spent the last two years of his life in a house at Monte Novo in the neighbourhood of Leghorn. Here, labouring under a painful and wasting disease, he composed his last work, *The Expedition of Humphrey Clinker*, published in 1771. This is generally regarded as his best novel. It certainly is the most pleasant reading, much softer and more humane in tone, while equally alive with vivid sketches and studies of character and a never-failing supply of ludicrous adventures. The loose and easy plan does not require for its execution the sustained power shown in *Count Fathom*, but, on the other hand, it leaves the novelist free to introduce greater variety of character and incident. None of his novels gives a better impression of Smollett's versatility than *Humphrey Clinker*, and there is none of them to which his successors have been more indebted. But whoever would understand how much the English novel owes to Smollett must read all his five fictions and not merely the most celebrated three. His influence upon novel-writing was wider even than Fielding's. He died at Monte Novo on 21st October 1771. (W. M.)

SMUGGLING denotes a breach of the revenue laws either by the importation or the exportation of prohibited goods or by the evasion of customs duties on goods liable to duty. Smuggling is, as might be expected, most prevalent where duties are high. The best preventive is the imposition of duties so low in amount and on so few articles that it becomes scarcely worth while to smuggle. Legislation on the subject in England has been very active from the 14th century downwards. In the reign of Edward III. the illicit introduction of base coin from abroad led to the provision of the Statute of Treasons (25 Edw. III. st. 5) making it treason to import counterfeit money as the money called "Lushburgh." Such importation is still an offence, though no longer treason. After the Statute of Treasons a vast number of Acts dealing with smuggling were passed, most of which will be found recited in the repealing Act of 6 Geo. IV. c. 105. In the 18th and the early years of the 19th century smuggling (chiefly of wine, spirits, tobacco, and bullion) was so generally practised in Great Britain as to become a kind of national failing, and the smuggler was often regarded as a popular hero, like the *contrabandista* of modern Spain. The prevalence of the offence a century and a half ago may be judged from the report of Sir J. Cope's committee in 1732 upon the frauds on the revenue. The smuggler of the 18th century finds an apologist in Adam Smith, who writes of him as "a person who, though no doubt highly blamable for violating the laws of his country, is frequently incapable of violating those of natural justice, and would have been in every respect an excellent citizen had not the laws of his country made that a crime which nature never meant to be so." The gradual reduction of duties has brought the offence in the United Kingdom into comparative insignificance, and it is now almost confined to tobacco. Most of the existing legislation on the subject of smuggling is contained in the Customs Consolidation Act, 1876 (39 and 40 Vict. c. 36, ss. 169-217).

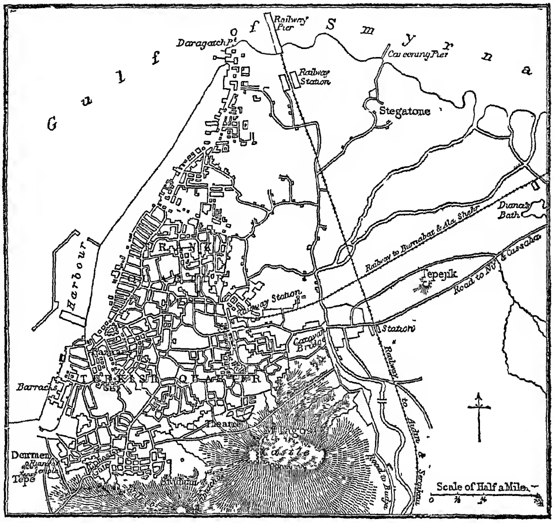
The main provisions are as follows. Vessels engaged in smuggling are liable to forfeiture and their owners and masters to a penalty not exceeding £500. Smuggled and prohibited goods are liable to forfeiture. Officers of customs have a right of search of vessels and persons. Fraudulent evasion or attempted evasion of customs duties renders the offender subject to forfeit either treble the value of the goods or £100 at the election of the commissioners of customs. Heavy penalties are incurred by resistance to officers of customs, rescue of person or goods, assembling to run goods, signalling smuggling vessels, shooting at vessels, boats, or officers of the naval or revenue service, cutting adrift customs vessels, offering goods for sale under pretence of being smuggled, &c. Penalties may be recovered either by action or information in the superior courts or by summary proceedings. In criminal proceedings the defendant is competent and compellable to give evidence. The Act applies to the United Kingdom, the Isle of Man, and the Channel Islands. Besides, the Customs Act, 50 Geo. III. c. 41, s. 16 (the corresponding Act for Scotland is 55 Geo. III. c. 71, s. 9), enacts that a hawker's licence is to be forfeited on his conviction for knowingly selling smuggled goods. The Merchant Shipping Act, 1854 (17 and 18 Vict. c. 104, s. 243), makes any seaman or apprentice, after conviction for smuggling whereby loss or damage is caused to the master or owner of a ship, liable to pay to such master or owner such a sum as is sufficient to reimburse the master or owner for such loss or damage, and the whole or a proportional part of his wages may be retained in satisfaction of this liability. Additional provisions as to smuggling are also contained in 42 and 43 Vict. c. 21 and 44 and 45 Vict. c. 12. A smuggling contract is generally illegal. But it may be valid, and the vendor may recover the price of goods, even though he knew the buyer intended them to be smuggled, unless he actually aids in the smuggling so as to become *particeps criminis*. Contracts to defraud the revenue of a foreign state are, according to English decisions, not illegal. There is a German decision, more consonant with international morality, to the opposite effect.

The penalties for smuggling in the United States will be found mainly in tit. xxxiv. ch. 10 of the Revised Statutes. The seaman guilty of smuggling is liable to the same penalty as in England, and in addition to imprisonment for twelve months, s. 4596.

A considerable amount of historical information on this subject will be found in Dowell's *History of Taxation* and Pike's *History of Crime in England*.

SMYRNA, in ancient times one of the most important and now by far the greatest of the cities of Asia Minor (see vol. xv. Plate II.), has preserved an unbroken continuity of record and identity of name from the first dawn of history to the present time. It is said to have been a Lelegian city before the Greek colonists settled in Asia Minor. The name, which is said to be derived from an Amazon called Smyrna, is indubitably Anatolian, having been applied also to a quarter of Ephesus, and (under the cognate form Myrina) to a city of Æolis, and to a tumulus in the Troad. The Æolic settlers of Lesbos and Cyme, pushing eastwards by Larissa and Neonteichus and over the Hermus, seized the valley of Smyrna. It was the frontier city between Æolis on the north and Ionia on the south, and was more accessible on the south and east than on the north and west. At the same time it was by virtue of its favourable situation necessarily a commercial city, like the Ionian colonies. It is therefore not surprising that the Æolic element grew weaker; strangers or refugees from the Ionian Colophon settled in the city, and finally Smyrna passed into the hands of the Colophonians and became the thirteenth of the Ionian states. The change had taken place before 688, when the Ionian Onomastus of Smyrna won the boxing prize at

Olympia, but it was probably then a recent event. The Colophonian conquest is mentioned by Mimnermus (before 600 B.C.), who counts himself equally a Colophonian and a Smyrnæan. The Æolic form of the name, Σμύρνα, was retained even in the Attic dialect, and the epithet "Æolian Smyrna" remained long after the conquest. The favourable situation of Smyrna on the path of commerce between Lydia and the west raised it during the 7th century to the height of power and splendour. It lay at the eastern end of an arm of the sea, which reached far inland and admitted the Greek trading ships into the heart of Lydia. One of the great trade routes which cross Anatolia from east to west descends the Hermus valley past Sardis, and then diverging from the valley passes south of Mount Sipylus and crosses a low pass into the little valley, about 7 miles long and 2 broad, where Smyrna lies between the mountains and the sea. Miletus, and at a later time Ephesus, situated at the sea end of the other great trade route across Anatolia, competed for a time successfully with Smyrna for the conveyance of traffic from the interior; but both Ephesus and Miletus have long ago lost their harbours, and Smyrna now remains without a rival. It was of necessity in close relation with the Lydians, and when the Mermnad kings raised the Lydian power and aggressiveness it was one of the first points of attack. Gyges (687-653) was, however, defeated in a great battle on the banks of the Hermus; the situation of the battlefield shows that the power of Smyrna extended far to the east, and probably included the valley of Nymphæum (Nif). A strong fortress, the ruins of whose ancient and massive walls are still imposing, on a hill in the pass between Smyrna and Nymphæum, was probably built by the Smyrnæan Ionians to command the valley of Nymphæum. According to the poet Theognis (about 500 B.C.), "pride destroyed Smyrna." Mimnermus laments the degeneracy of the citizens of his day, who could no longer stem the Lydian advance. Finally, Alyattes (610-563) conquered the city, and Smyrna for 300 years lost its place in the list of Greek cities. It did not entirely cease to exist, but the Greek life and political unity were destroyed, and the Smyrnæan state was organized on the village system (ᾤκεῖτο κωμηδόν). It is mentioned in a fragment of Pindar, about 500 B.C., and in an inscription of 388 B.C. A small fortification of early style, rudely but massively built, on the lowest slope of a hill behind Burnabat, is perhaps a fortified village of this period. Alexander the Great conceived the idea of restoring the Greek city; the two Nemeses who were worshipped at Smyrna are said to have suggested the idea to him in a dream. The scheme was, according to Strabo, carried out by Antigonus (316-301), and Lysimachus enlarged and fortified the city (301-281). The acropolis of the ancient city had been on a steep peak about 1250 feet high, which overhangs the north-eastern extremity of the gulf; its ruins still exist, probably in much the same condition as they were left by Alyattes. The later city was founded on the site which it still occupies, partly on the slopes of a rounded hill called Pagus near the south-east end of the gulf, partly on the low ground between the hill and the sea. The beauty of the city when seen from the sea, clustering on the low ground and rising tier over tier on the hillside, is frequently praised by the ancients and is celebrated on its coins; the same impression still strikes the spectator, and must in ancient times have been much stronger, when magnificent buildings, an imposing acropolis, and the wide circle of massive walls combined with the natural scenery in one splendid picture. Smyrna is shut in on the west by a hill now called Deirmen Tepe, with the ruins of a temple on the summit. The walls of Lysimachus crossed the summit of this hill, and the acropolis occupied the top of Pagus. Between the two the road from Ephesus entered the city by the "Ephesian gate," near which was a gymnasium. Closer to the acropolis the outline of the stadium is still visible, and the theatre was situated on the northern slopes of Pagus. The line of the walls on the eastern side is



Plan of Smyrna

unknown, but they certainly embraced a greater area than is included by the Byzantine wall, which ascends the castle hill (Pagus) from the Basmakhané railway station. Smyrna possessed two harbours,—the outer, which was simply the gulf, and the inner, which was a small basin, with a narrow entrance closed by a rope in case of need, about the place now occupied by bazaars. The inner harbour was partially filled up by Timur in 1402, but it had not entirely disappeared till the beginning of the 19th century. The modern quay has encroached considerably on the sea, and the coast-line of the Greek time was about 90 yards farther to the south. The streets were broad, well paved, and regularly laid out at right angles; many were named after temples; the main street, called the Golden, ran across the city from west to east, beginning probably from the temple on Deirmen Tepe, and continuing towards Tepejik outside the city on the east, where probably the temple of Cybele, the Metroon, stood. Cybele, worshipped under the name of Meter Sipylene, from Mount Sipylus, which bounds the Smyrna valley on the north,

was the tutelar goddess of the city The plain towards the sea was too low to be properly drained, and hence in rainy weather the streets were deep with mud and water

The river Meles, which flowed by Smyrna, is famous in literature and was worshipped in the valley The most common and consistent tradition connects Homer with the valley of Smyrna and the banks of the Meles, his figure was one of the stock types on Smyrnæan coins, one class of which was called Homerian, the epithet "Melesigenes" was applied to him, the cave where he was wont to compose his poems was shown near the source of the river, his temple, the Homereum, stood on its banks The steady equable flow of the Meles, alike in summer and winter, neither swollen after rain nor dry during drought, its pleasant water, its short course, beginning and ending near the city, are celebrated by Aristides and Himerius The description applies admirably to the stream which rises from abundant fountains, now known as Diana's Bath, some way to the east of the city, and flows into the south-eastern extremity of the gulf The common belief that the torrent, dry except after rains, which flows by Caravan Bridge is the ancient Meles flatly contradicts the ancient descriptions

In the Roman period Smyrna was the seat of a *conventus* which included southern Æolis and great part of the Hermus valley It vied with Ephesus and Pergamum for the title "First (city) of Asia" A Christian church existed here from a very early time, having its origin in the considerable Jewish colony POLYCARP (*q v*) was bishop of Smyrna The bishops of Smyrna were originally subject to the metropolitan of Ephesus, afterwards they became independent (*αὐτοκέφαλοι*), and finally were honoured with metropolitan rank, having under them the bishops of Phocæa, Magnesia ad Sipylum, Clazomenæ, Sosandrus (Nymphæum?), Archangelus (Temnos?), and Petra (Menemen?)

When Constantinople became the seat of government the trade between Anatolia and the west lost in importance, and Smyrna declined apace A Turkish freebooter named Tsacha seized Smyrna in 1084 and maintained himself there for some time, but it was recovered by the generals of Alexius Comnenus The city was several times afterwards ravaged by the Turks, and had become quite ruinous when the emperor John Ducas Vatatzes about 1222 rebuilt it The famous chieftain Aidin conquered it about 1330 and made his son Amur governor Soon afterwards the knights of Saint John established themselves in the town, but failed to conquer the citadel. In 1402 Timur stormed the town and massacred almost all the inhabitants The Mongol conquest was only temporary, but Smyrna has remained till the present day in Mohammedan hands It is now the greatest commercial city in the Levant, its population is about 200,000, of whom nearly half are Greeks It is the terminus of the railway system which is gradually spreading over Anatolia. Two lines start from Smyrna one ascends the Hermus valley by Magnesia and Sardis to Alashehr (Philadelphia), about 110 miles, the other goes south by Ephesus to the Mæander valley beside Magnesia on the Mæander and then ascends the valley to the neighbourhood of Laodicea on the Lycus, 143 miles Since the revival of the Levant trade by the Genoese and Venetians Smyrna has been the emporium for the whole produce of Anatolia, the chief raw products exported are valonea, figs, raisins, opium, madder, liquorice, cotton, sponges, emery, &c, almost the only articles of native manufacture which are exported from Smyrna are the carpets woven at Geurdiz, Coula, Ushak, and other places in the interior. Smyrna has frequently been partially destroyed by earthquakes, that of 178 A D is the most famous, and in 1688, 1768, and 1880 the town suffered severely . (W M RA)

SNAIL In England the word "snail" in popular language is associated with Gasteropods which inhabit land or fresh water and which possess large conspicuous spiral shells, terrestrial Gasteropods in which the shell is rudimentary and concealed are distinguished as "slugs" In Scotland the word "slug" is absent from the vernacular vocabulary, both shell-bearing and shell-less inland molluscs being known as snails Marine Gasteropods are occasionally termed "sea-snails," and the compounds "pond-snails," "river-snails," "water-snails" are in common use The commonest land-snails are those species which constitute the family *Helicidæ*, order *Pulmonata*, sub-order *Stylommatophora* The other two families of the same sub-order, *Limacidæ* and *Oncidiidæ*, include all the slugs In the first of these are comprised all the slugs known in Great Britain, and indeed in Europe The *Oncidiidæ* are entitled to the name "sea-slugs," as they are shell-less Pulmonates living on the seashore, though not actually in the sea The term "water-snails" includes the whole of the remaining sub-order of the *Pulmonata*, namely, the *Basommatophora*, in which the eyes are sessile This division comprises two families, *Limnæidæ* and *Auriculidæ*, some of the members of the first are amphibious, some entirely aquatic, the snails of the second family are found near but not in the water Thus the whole of the *Pulmonata* which breathe air, are destitute of gill-plumes and operculum, and have a complicated hermaphrodite reproductive system are either snails or slugs But there are a considerable number of snails, both terrestrial and aquatic, which are not Pulmonates The land-snails which have no gill-plume in the mantle-chamber and breathe air, but have the sexes separated, and possess an operculum belong to the order *Azygobranchia*, of which they form a distinct sub-order, the *Pneumonochlamyda*, containing three families, *Cyclostomidæ*, *Helicinidæ*, and *Aciculidæ* The fresh-water snails which are not Pulmonates are the *Paludinidæ*, *Valvatidæ*, and *Ampullaridæ*, together with *Neritina*, a genus of the *Neritidæ* These all possess a fully developed gill-plume and are typical Azygobranchiates of the sub-order *Holochlamyda*, most of the members of which are marine

The family *Helicidæ* has a world-wide distribution In *Helix* the spire forms a more or less obtuse-angled cone, there are above 1200 species, of which 24 are British *Helix nemoralis*, L, of which *H hortensis* is a variety, is one of the commonest forms *Helix pomatia*, L, is the largest species, and is known as the "edible snail", it is commonly eaten in France and Italy, together with other species It was formerly believed to have been introduced into Britain by the Romans, but there is no doubt that it is a native In *Succinea* the cone of the spire is acute angled, three species are British In *Vitrina* the spire is very flat and the surface glassy In *Bulimus* the spire is elongated with a pointed apex *Pupa* is named from its resemblance to a chrysalis, the apex being rounded The shell of *Clausilia* is sinistral and its aperture is provided with a hinged plate The commoner European slugs of small size all belong to the genus *Limax*, in which the opening of the mantle chamber is posterior *L flavus* is the cellar slug *L agrestis*, *L arborum*, *L maximus*, occur in gardens and fields The larger black slugs are species of *Arion*, of which two are British, *A ater* and *A hortensis* *Testacella haliotidea* is common in Great Britain and throughout Europe

The *Limnæidæ* occur in all parts of the world *Limnæus* contains the largest species *L pereger*, Muller, is ubiquitous in Great Britain and common all over Europe All the species are usually infested with *Cercariæ* and *Rediæ*, the larval forms of Trematode parasites of vertebrates *L truncatulus* harbours the *Cercaria* of *Fasciola hepatica*, the liver-fluke, which causes rot in sheep *Ancylus*, which occurs in rivers, has a minute limpet-like shell *Planorbis* has the spire of the shell in one plane *Physa* is smaller than *Limnæus* and has the upper part of the spire much shorter In the *Auriculidæ* the aperture is denticulated *Auricula* is confined to the East Indies and Peru *Carychium minimum* is British

Of the *Cyclostomidæ* only one species, *Cyclostoma elegans*, Muller, is British, it hides under stones and roots The *Helicinidæ* are exotic, ranging from the West Indies to the Philippines Of the *Aciculidæ*, which are all minute, *Acicula lineata* is British

The *Ampullaridæ* are confined to the tropics *Ampullaria* has very long tentacles and a long siphon formed by the mantle

Valvata is common in fresh waters throughout Britain; the gill when the animal is expanded is protruded beyond the mantle-chamber. The *Paludinidæ* are common in the northern hemisphere. *Paludina* and *Bithynia* are both British genera. In *Paludina* the whorls of the spiral are very prominent; the genus is viviparous. *Bithynia* is smaller and the shell smoother.

Neritina has a very small spire, the terminal portion of the shell containing nearly the whole animal.

For the morphology and classification of snails, see MOLLUSCA, vol. xvi. p. 648 *sq.* A history of the British forms is given in Gwyn Jeffreys's *British Conchology*, 1862, and by Forbes and Hanley in *British Mollusca*. For speciegraphical details, see Woodward's *Manual of the Mollusca*, 1875, and Bronn's *Thierreich* (Weichthiere). For *Fasciola hepatica*, see Thomas, *Quart. Journ. Mic. Sci.*, 1882.

SNAKE-BIRD, to use the name commonly given to it by the English in North America, because of its "long slender head and neck," which, its body being submerged as it swims, "appear like a snake rising erect out of the water" (Bartram's MS., quoted by Ord in Wilson's *Am. Ornithology*, ix. p. 81), the "Darter" of many authors, and the *Plotus anhinga*[1] of ornithology, is the type of a small but very well-marked Family of Birds, *Plotidæ*, belonging to the group *Steganopodes* (the *Dysporomorphæ* of Prof. Huxley), and consisting of but a single genus and three or four species. They bear a general resemblance both outwardly and in habits to Cormorants (see vol. vi. p. 407), but are much more slender in form and have both neck and tail much elongated. The bill also, instead of being tipped with a maxillary hook, has its edges beset with serratures directed backwards, and is sharply pointed,—in this respect, as well as in the attenuated neck, likening the Snake-birds to the Herons (see vol. xi. p. 760); but the latter do not generally transfix their prey as do the former.

The male of the American species, which ranges from Illinois to the south of Brazil, is in full breeding-plumage a very beautiful bird, with crimson irides, the bare skin round the eyes apple-green

Indian snake-bird (from Col. Tickell's drawing in the library of the Zoological Society).

and that of the chin orange, the head, neck, and most part of the body clothed in black glossed with green; but down each side of the neck runs a row of long hair-like white feathers, tinged with pale lilac. The much elongated scapulars and the small upper wing-coverts bear each a median white mark, which on the former is a stripe pointed at either end, and on the latter a broad ovate patch.[2] The larger wing-coverts are dull white, but the quill-feathers of the wings and tail are black, the last broadly tipped with brownish-red, passing into greyish-white, and forming a conspicuous band when the tail is spread in form of a fan, as it often is under water.[3] The hen differs much in appearance from the cock, having the head, neck, and breast of a more or less deep buff, bounded beneath by a narrow chestnut band; but otherwise her plumage is like that of her mate, only not so bright in colour. The habits of this species have been repeatedly described by American writers, and those of its congeners, to be immediately mentioned, seem to be essentially the same. The Snake-bird frequents the larger rivers or back-waters connected with them, where it may be seen resting motionless on some neighbouring tree, generally choosing a dead branch, or on a "snag" projecting from the bottom, whence it plunges beneath the surface, in pursuit of its fishy prey, to emerge, in the manner before related, showing little more than its slender head and neck. Its speed and skill under water are almost beyond exaggeration, and it exhibits these qualities even in captivity, taking—apparently without effort—fish after fish that may be introduced into its tank, however rapidly they may swim and twist, and only returning to its perch when its voracious appetite is for the moment appeased or its supply of food temporarily exhausted. Then, after adjusting its plumage with a few rapid passes of its bill, and often expanding its wings, as though, Cormorant-fashion, to dry them, it abandons itself to the pleasurable and passive process of digestion, reawaking to activity at the call of hunger. Yet at liberty it will indulge in long flights, and those of the male at the breeding-season are ostentatiously performed in the presence of his mate, around whom he plays in irregular zigzag courses. The nest is variously placed, but almost always in trees or bushes overhanging the water's edge, and is a large structure of sticks, roots, and moss, in which are laid four eggs with the white chalky shell that is so characteristic of most Steganopodous birds. Not unfrequently several or even many nests are built close together, and the locality that suits the Snake-bird suits also many of the Herons, so that these, its distant relatives, are often also its near neighbours.[4] The African Snake-bird, *P. congensis* (or *levaillanti* of some authors), inhabits the greater part of that continent from Natal northwards; but, though met with on the White Nile, it is not known to have occurred in Egypt, a fact the more remarkable seeing that Canon Tristram found it breeding in considerable numbers on the Lake of Antioch, to which it is a summer visitor, and it can hardly reach its home without passing over the intervening country. The male bird is easily distinguishable from the American species by its rufous coronal patch, its buff throat and its chestnut greater wing-coverts. A third species, *P. melanogaster*, ranges from Madagascar to India, Ceylon, Borneo, Java, and China. This so closely resembles the last-mentioned that the differences between them cannot be briefly expressed. The Australian region also has its Snake-bird, which is by some regarded as forming a fourth species, *P. novæ-hollandiæ*; but others unite it to that last-mentioned, which is perhaps somewhat variable, and it would seem (*P. Z. S.*, 1877, p. 349) that examples from New Guinea differ somewhat from those inhabiting Australia itself.

The anatomy of the genus *Plotus* has been dealt with more fully than that of most forms. Beside the excellent description of the American bird's alimentary canal furnished to Audubon by Macgillivray, other important points in its structure have been well set forth by Garrod and Forbes in the Zoological *Proceedings* (1876, pp. 335-345, pls. xxvi.-xxviii.; 1878, pp. 679-681; and 1882, pp. 208-212), showing among other things that there is an appreciable anatomical difference between the species of the New World and of the Old; while the osteology of *P. melanogaster* has been admirably described and illustrated by Prof. Milne-Edwards in M. Grandidier's great *Oiseaux de Madagascar* (pp. 691-695, pls. 284, 285). In all the species the neck affords a feature which seems to be unique. The first seven of the cervical vertebræ form a continuous curve with its concavity forward, but the eighth articulates with the seventh nearly at a right angle, and, when the bird is at rest, lies horizontally. The ninth is directed downwards almost as abruptly, and those which succeed present a gentle forward convexity. The muscles moving this curious framework are as curiously specialized, and the result of the whole piece of mechanism is to enable the bird to spear with facility its fishy prey. (A. N.)

[1] "Anhinga," according to Marcgrave, who first described this bird (*Hist. Rer. Nat. Brasiliæ*, p. 218), was the name it bore among the natives.

[2] These feathers are very characteristic of each species of the genus, and in India, says Jerdon, are among the Khasias a badge of royalty.

[3] This peculiarity, first pointed out to the writer by Mr. Bartlett, who observed it in birds in the Zoological Society's possession, doubtless suggested the name of "Water-Turkey" by which in some places *Plotus anhinga* is said to be known.

[4] The curious but apparently well-attested fact of the occurrence in England, near Poole, in June 1851, of a male bird of this species (*Zoologist*, pp. 3601, 3654) has been overlooked by several writers who profess to mention all cases of a similar character.

SNAKE-ROOT In most countries where snakes abound some root or herb is used by the natives as an antidote for the bites of venomous species, and many herbs have consequently received the name of snake-root Botanically speaking, the name properly belongs to *Ophiorrhiza Mungos*, L, a plant of the Cinchona family, used in the East Indies for the purpose above indicated In medicine, however, the roots of *Aristolochia Serpentaria*, L, *Polygala Senega*, L, or *Cimicifuga racemosa*, Elliott, are alike understood by this name, being distinguished respectively as the Virginian, Seneka, and Black Snake-roots The first is now employed as an aromatic antiseptic tonic in typhoid fever, the second as a stimulant expectorant in bronchitis, and the third as a sedative in rheumatic or inflammatory affections, especially in muscular rheumatism and lumbago The root of *Aristolochia reticulata*, Nutt, which is known in the United States as Red River or Texan Snake-root, is the kind most frequently met with in the United Kingdom as Serpentary or Virginian Snake-root (See GUACO)

The roots or rhizome of *Liatris spicata*, Willd, *Eryngium aquaticum*, L, and *Eupatorium altissimum*, L, have all been used in North America for snake-bites, the first two being known as Button Snake-root and the last as White Snake-root The rhizome of *Asarum canadense*, L, passes under the name of Canadian Snake-root All of these contain acrid or aromatic principles which, when a warm decoction of the drug is taken, exercise a powerfully diaphoretic or, in some cases, diuretic action, to which any benefit that may be derived from their use must be attributed

SNAKES constitute an order (*Ophidia*) in the class of Reptiles which is characterized by an exceedingly elongate body, cylindrical or sub-cylindrical, and terminating in a tapering tail The integuments are folded into flat imbricate scales, which are rarely tubercular or granular The spinal column consists of a very great number of vertebræ, with which the numerous ribs are movably articulated Limbs are entirely absent, or only rudiments of the posterior occur more or less hidden below the skin, there is no sternum The bones of the palate and jaws are movable, the mandibles are united in front by an elastic ligament and are very distensible Generally both jaws and the palate are toothed, the teeth being thin and needle-like There are no eyelids, no ear-opening The vent is a transverse slit

Snakes and lizards

Great as is the difference in appearance between a typical snake and a typical lizard, the two orders of Ophidians and Lacertilians are nearly allied, the former is probably merely a specialized descendant of the latter or of the pythonomorphous reptiles, or perhaps of both Moreover, the living Lacertilians include forms which approach the Ophidians by having a greatly increased number of vertebræ, a much advanced degradation of the scapular and pelvic arches and limbs, a simple dentition, and the absence of eyelids and external ear-opening And on the other hand we find Ophidians with a greatly diminished flexibility of the vertebral column, with closely adherent, smooth and polished scales, with a narrow mouth—totally unlike the enormous gape of the typical snakes—and even without that longitudinal fold in the median line of the chin which is so characteristic of the order (*Typhlopidæ*) Thus of the Ophidian characters as given above only that taken from the loose connexion of the bones of the skull remains as a sharp line of separation between snakes and lizards The mandibulary symphysis is not by suture but by an elastic band, the intermaxillary, palatine, and pterygoid bones are so loosely attached to the cranium that they can be easily pressed outwards and forwards, and the maxillary and mandibulary of one side can be moved in those directions independently of their fellows opposite The intermaxillary is small, generally toothless, and coalesces with the nasals and vomer into a single movable bone, finally, the suspensory is much elongate and movable at both ends This arrangement ensures an extraordinary degree of mobility and elasticity of all parts of the gape, which, however, varies in the different families of the order For the other characteristic points of their structure and for their distribution, see REPTILES

Distribution and habits

The number of known species of snakes has been given as 1500 by some authorities and as 1800 by others The limits of their distribution seem to be the 70th parallel N lat in Europe, the 54th in British Columbia, and the 40th parallel S lat in the southern hemisphere The number of species and of individuals in a species is small in the temperate zones, but increases as the tropics are approached In the tropical zone they are abundant, especially where a well-watered soil nourishes a rich vegetation, with glades open to the sun, and where a variety of small animals serve as an abundant and easily obtained prey It is in the tropics also that the largest (boas, pythons) and the most specialized kinds occur (tree snakes, sea snakes, the large poisonous snakes) On the other hand, every variety of soil is tenanted by some kind of snakes they form a contingent in every desert fauna In accordance with this general distribution snakes show a great amount of differentiation with regard to their mode of life and general organization, and from the appearance alone of a snake a safe conclusion can be drawn as to its habits The following categories may be distinguished

(1) Burrowing snakes, which live under ground and but rarely appear on the surface They have a cylindrical rigid body, covered with generally smooth and polished scales, a short strong tail, a short rounded or pointed head with narrow mouth, teeth few in number, small or rudimentary eye, no abdominal scutes or only narrow ones They feed chiefly on invertebrate animals, and none are poisonous (2) Ground snakes, living chiefly on the ground, and rarely ascending bushes or entering water Their body is cylindrical, flexible in every part, covered with smooth or keeled scales, and provided with broad ventral and subcaudal scutes All the various parts of their body and head are well proportioned, the non-poisonous kinds of ground snakes are in fact the typical and least specialized snakes, and more numerous than any of the other kinds They feed chiefly on terrestrial vertebrates The majority are non-poisonous, but the majority of poisonous snakes must be referred to this category (3) Tree snakes, which are able to climb bushes or trees with facility or pass even the greater part of their existence on trees Their body is rarely cylindrical, generally compressed and slender, their broad ventral scutes are often carinate on the sides Those kinds which have a less elongate and cylindrical body possess a distinctly prehensile tail The eye is generally large Their coloration consists often of bright hues, and sometimes resembles that of their surroundings They feed on animals which likewise lead an arboreal life, rarely on eggs Poisonous as well as innocuous snakes are represented in this category (4) Freshwater snakes, living in or frequenting fresh waters, they are excellent swimmers and divers The nostrils are placed on the top of the snout and can be closed whilst the animal is under water Their body is cylindrical, moderately long, provided with narrow ventral scutes, the tail tapering, head flat, rather short, and the eyes of small size They feed on fish, frogs, and other aquatic animals, and are innocuous and viviparous (5) Sea snakes are distinguished by the compressed, rudder-shaped tail, supported by erect neural and hæmal spines They never leave the sea (with the exception of one genus) and are unable to move on land They feed on fishes, are viviparous and poisonous

The majority of snakes are active during the day, their energy increasing with the increasing temperature of the air, whilst some delight in the moist sweltering heat of dense tropical vegetation, others expose themselves to the fiercest rays of the midday sun. Not a few, however, lead a nocturnal life, and many of them have, accordingly, their pupil contracted into a vertical or more rarely a horizontal slit. Those which inhabit temperate latitudes hibernate. Snakes are the most stationary of all vertebrates; as long as a locality affords them a sufficiency of food and some shelter to which they can readily retreat, they have no inducement to change it. Their dispersal, therefore, must have been extremely slow and gradual.

Locomotion. Although able to move with extreme rapidity, they cannot maintain it for any length of time. Their organs of locomotion are the ribs, the number of which is very great, nearly corresponding to that of the vertebræ of the trunk. They can adapt their motions to every variation of the ground over which they move, yet all varieties of snake locomotion are founded on the following simple process. When a part of the body has found some projection of

Fig 1.—Diagram of natural locomotion of a snake.

the ground which affords it a point of support, the ribs are drawn more closely together, on alternate sides, thereby producing alternate bends of the body. The hinder portion of the body being drawn after, some part of it (c) finds another support on the rough ground or a projection; and, the anterior bends being stretched in a straight line, the front part of the body is propelled (from *a* to *d*) in consequence. During this peculiar locomotion the numerous broad shields of the belly are of great advantage, as by means of their free edges the snake is enabled to catch and use as points of support the slightest projections of the ground. A pair of ribs corresponds to each of these ventral shields. Snakes are not able to move over a perfectly smooth surface. Thus it is evident that they move by dragging their body over the ground, or over some

Fig 2.—Diagram of conventional idea of a snake's locomotion.

other firm base, such as the branch of a tree; hence the conventional representation of the progress of a snake, in which its undulating body is figured as resting by a series of lower bends on the ground whilst the alternate bends are raised above it, is an impossible attitude. Also the notion that snakes when attacking are able to jump off the ground is quite erroneous; when they strike an object, they dart the fore part of their body, which was retracted in several bends, forwards in a straight line. And sometimes very active snakes, like the cobra, advance simultaneously with the remainder of the body, which, however, glides in the ordinary fashion over the ground; but no snake is able to impart such an impetus to the whole of its body as to lose its contact with the ground. Some snakes can raise the anterior part of their body and even move in this attitude, but it is only about the anterior fourth or third of the total length which can be thus erected.

Integuments. With very few exceptions, the integuments form imbricate scale-like folds arranged with the greatest regularity; they are small and pluriserial on the upper parts of the body and tail, large and uniserial on the abdomen, and generally biserial on the lower side of the tail. The folds can be stretched out, so that the skin is capable of a great degree of distension. The scales are sometimes rounded behind, but generally rhombic in shape and more or less elongate; they may be quite smooth or provided with a longitudinal ridge or *keel* in the middle line. The integuments of the head are divided into non-imbricate shields or plates, symmetrically arranged, but not corresponding in size or shape with the underlying cranial bones or having any relation to them. The form and number of the scales and scutes, and the shape and arrangement of the head-shields, are of great value in distinguishing the genera and species, and it will therefore be useful to explain in the accompanying woodcut (fig 3) the terms by which these parts are designated. The skin does not form eyelids, but the epidermis passes over the eye, forming a transparent disk, concave like the glass of a watch, behind which the eye moves. It is the first part which is cast off when the snake sheds its skin; this is done several times in the year, and the epidermis comes off in a single piece.

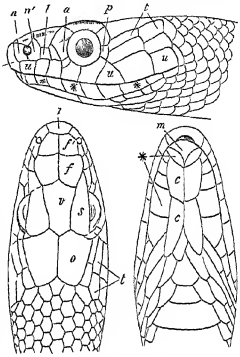


Fig 3.—Head shields of a snake (*Ptyas korros*). *r*, Rostral, *f*, posterior frontal, *f′*, anterior frontal, *v*, vertical, *s*, superciliary or supraocular, *o*, occipital, *n*, *n′*, nasals, *l*, loreal, *a*, anterior ocular or orbital, or praeorbital or anteocular, *p*, post oculars, *u*, *u*, upper labials, *t*, *t*, temporals, *m*, mental, *, *, lower labials, *c*, *c*, chin shields.

Tongue. The tongue in snakes is narrow, almost worm-like, generally of a black colour and forked, that is, it terminates in front in two extremely fine filaments. It is often exserted with a rapid motion, sometimes with the object of feeling some object, sometimes under the influence of anger or fear.

Dentition. Snakes possess teeth in the maxillaries, mandibles, palatine, and pterygoid bones, sometimes also in the intermaxillary; they may be absent in one or the other of the bones mentioned. In the innocuous snakes the teeth are simple and uniform in structure, thin, sharp like needles, and bent backwards; their function consists merely in seizing and holding the prey. In some all the teeth are nearly of the same size; others possess in front of the jaws (Lycodonts) or behind in the maxillaries (Diacrasterians) a tooth more or less conspicuously larger than the rest; whilst others again are distinguished by this larger posterior tooth being grooved along its outer face. The snakes with this grooved kind of tooth have been named *Opisthoglypha*, and also *Suspecti*, because some herpetologists were of opinion that the function of the groove of the tooth was to facilitate the introduction of poisonous saliva into a wound. The venomous nature of these snakes, however, has never been proved, and persons are frequently bitten by them without any evil consequences. Nevertheless as the depth of the groove, the length of the tooth, and the development of the salivary glands in its vicinity vary greatly, it is quite possible that the function and the physiological effect of this apparatus are not the same in all Opisthoglyphs. In the true poisonous snakes the maxillary dentition has undergone a special modification. The so-called Colubrine Venomous snakes, which retain in a great measure an external resemblance to the innocuous snakes, have the maxillary bone not at all, or but little, shortened, armed in front with a fixed, erect fang, and provided with a deep groove or closed

canal for the conveyance of the poison, the fluid being secreted by a special poison-gland. One or more small ordinary teeth may be placed at some distance behind this poison-fang. In the other venomous snakes (Viperines and Crotalines) the maxillary bone is very short, and is armed with a single very long curved fang with a canal and aperture at each end. Although firmly anchylosed to the bone, the tooth, which when at rest is laid backwards, is erectile,—the bone itself being mobile and rotated round its transverse axis by muscles. One or more reserve teeth, in various stages of development, lie between the folds of the gum and are ready to take the place of the one in function whenever it is lost by accident, or shed, which seems to happen at regular intervals. The gland which secretes the poison is described under REPTILES (vol. xx. p. 457).

Food

All snakes are carnivorous, and as a rule take living prey only; a few feed habitually or occasionally on eggs. Many swallow their victim alive; others first kill it by smothering it between the coils of their body (constriction). The effects of a bite by a poisonous snake upon a small mammal or bird are almost instantaneous, preventing its escape; and the snake swallows its victim at its leisure, sometimes hours after it has been killed. The prey is always swallowed entire, and, as its girth generally much exceeds that of the snake, the progress of deglutition is very laborious and slow. Opening their jaws to their fullest extent, they seize the animal generally by the head, and pushing alternately the right and left sides of the jaws forward, they press the body through their elastic gullet into the stomach, its outlines being visible for some time through the distended walls of the abdomen. Digestion is quick and much accelerated by the quantity of saliva which is secreted during the progress of deglutition, and in venomous snakes probably also by the chemical action of the poison. The primary function of the poison-apparatus in the economy of snakes is without doubt to serve as the means of procuring their food. But, like the weapons of other carnivorous animals, it has assumed the secondary function of an organ of defence. Only very few poisonous snakes (like *Ophiophagus elaps*) are known to resent the approach of man so much as to follow him on his retreat and to attack him. Others, as if conscious of their fearful power of inflicting injury, are much less inclined to avoid collision with man than innocuous kinds, and are excited by the slightest provocation to use that power in self-defence. They have thus become one of the greatest scourges to mankind, and Sir J. Fayrer[1] has demonstrated that in India alone annually some 20,000 human beings perish from snake-bites. Therefore it will not be out of place to add here a few words on snake-poison and on the best means (ineffectual though they be in numerous cases) of counteracting its deleterious effects.

Action of snake-poison

Chemistry has not yet succeeded in separating the active principle of snake-poison or in distinguishing between the secretions of different kinds of poisonous snakes; in fact it seems to be identical in all, and probably not different from the poison of scorpions and many *Hymenoptera*. The physiological effects of all these poisons on warm blooded Vertebrates are identical, and vary only in degree, the smallest quantities of the poison producing a local irritation, whilst in serious cases the whole mass of the blood is poisoned in the course of some seconds or minutes, producing paralysis of the nerve centres. That there is some difference, however, in the action of the poisons upon the blood has been shown by Fayrer, who found that the poison of Viperine snakes invariably destroys its coagulability, whilst nothing of the kind is observed in animals which perished from the bite of a Colubrine Venomous snake. The same observer has also experimentally demonstrated that the blood of a poisoned warm-blooded animal assumes poisonous properties, and, when injected, kills like the poison itself, although the bodies of the animals may be eaten by man with impunity. On the other hand, he has proved that the opinion generally adopted since Redi's time, viz., that snake-poison is efficacious only through direct injection into the blood, is fallacious, and that it is readily absorbed through mucous and serous membranes, producing the same effects, though in a milder degree.

Causes influencing snake-bites

The degree of danger arising from a snake-bite to man depends in the first place on the quantity of poison injected: a large vigorous snake which has not bitten for some time is more to be feared than one of small size or one which is weakly or has exhausted its stock of poison by previous bites. The bite of some of the smaller Australian Diemenias and *Hoplocephali* is followed by no worse consequences than those arising from the sting of a wasp or a hornet, while immediately fatal cases are on record of persons bitten by the cobra or the large South American Crotalines. In the second place it depends on the strength of the individual bitten: a man of strong physical constitution and energetic mental disposition is better able to survive the immediate effects of the bite than a child or a person wanting in courage. Thirdly, it depends on the position and depth of the bite: the bite may be merely a superficial scratch, or may penetrate into tissue having few blood-vessels, and thus be almost harmless; or it may be deep in vascular tissue or even penetrate a vein, producing immediate and fatal effects. It must be mentioned also that Fayrer is distinctly of opinion that the poison of some kinds is more powerful than that of others. The mere shock produced by the bite of a snake upon a nervous person may be sufficiently severe to be followed by symptoms of collapse, although no actual poisoning of the blood has taken place, or although the bite was that of an innocuous snake. It is said that persons have actually died under such circumstances from mere fright. The local appearances in the neighbourhood of a poisoned wound, which soon after the bite is much swollen and discoloured and very painful, readily prove its character; but this can be often ascertained also immediately after the bite by the inspection of the wound,—the teeth, which are so differently arranged in poisonous and non-poisonous snakes, leaving a different pattern on the skin. As a non-poisonous snake has four rows of teeth in the upper jaw, the pattern of its bite will more or less resemble fig. 4, whilst a poisonous snake leaves two rows of more distinctly marked punctured wounds in the place of the two outer series in the non-poisonous (see fig. 5). Of course, there may be modifications of these patterns, as, for instance, when one fang only hits or penetrates the part aimed at, or when the direction of the stroke is slanting, producing merely a scratch.

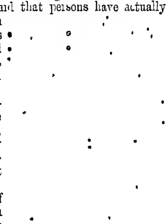

Fig. 4. Fig. 5.

FIG. 4.—Diagram of toothmarks of an innocuous snake.

FIG. 5.—Diagram of toothmarks of a poisonous snake (cobra).

Remedies and treatment

Unfortunately no antidote is known capable of counteracting or neutralizing the action of snake-poison. Some years ago injections of ammonia or liquor potassæ were recommended, but there is the obvious objection that hardly in one out of a thousand cases of snake bite would either the appliances or the operator be at hand. Fayrer's experiments, however, have distinctly disproved the efficacy of this remedial measure. Equally useless is permanganate of potassium; it is indeed true that a solution of this compound destroys the properties of snake poison when mixed with it; and therefore such of the poison as remains in the wound will be neutralized by the external application or injection of the permanganate, but the remedy is entirely without effect after the poison has passed into the circulation. Treatment is therefore limited to endeavours to prevent by mechanical means the poison from entering the circulation, or by chemical agencies to destroy or remove as much of it as possible that remains in the wound, and to save the patient from the subsequent mental and physical depression by the free use of stimulants. Whatever is or can be done must be done immediately, as a few seconds suffice to carry the poison into the whole vascular system, and the slightest delay diminishes the chances of the patient's recovery. Courageous persons badly bitten in a finger or toe are known to have saved their lives by the immediate amputation of the wounded member. To the mode of treatment summarized by Günther[2] but little can be added. (1) If the wound is on some part of the extremities, one or more ligatures should be made as tightly as possible at a short distance above the wound, to stop circulation; this is most effectually done by inserting a stick under the ligature and twisting it to the uttermost. The ligatures are left until means are taken to destroy the virus in the wound and other remedial measures are resorted to, or until the swelling necessitates their removal. (2) The punctured wounds should be enlarged by deep incisions, to cause a free efflux of the poisoned blood, or should be cut out entirely. (3) The wound should be sucked either by the patient

[1] *The Thanatophidia of India*, fol., London, 1872.

[2] *Reptiles of British India*, London, 1864, 4to.

or some other person whose mouth is free from any solution of continuity Cupping glasses, where they can be applied, answer the same purpose, but not with the same effect (4) By cauterization with a red hot iron a live coal, nitrate of silver or carbolic or mineral acid, or by injections of permanganate of potassium, the poison which remains in the wound can be destroyed or neutralized Ammonia applied to the wound as a wash and rubbed into the neighbouring parts is likewise undeniably of great benefit, especially in less serious cases, since it alleviates the pain and reduces the swelling (5) Internally, stimulants are to be taken freely, they do not act as specifics against the virus, but are given to excite the action of the heart, the contractions of which become feeble and irregular, to counteract the physical and mental depression, and to prevent a complete collapse Brandy, whisky, and ammonia in any of its officinal forms should be taken in large doses and at short intervals The so-called "snake-stones" can have no other effect than, at the best, to act as local absorbents, and can be of use only in the very slightest cases

Propagation Snakes are oviparous, they deposit from ten to eighty eggs of an ellipsoid shape, covered with a soft leathery shell, in places where they are exposed to and hatched by moist heat The parents pay no further attention to them, except the pythons, which incubate their eggs by coiling their body over them, and fiercely defend them In some families, as many freshwater snakes, the sea snakes, *Viperidæ*, and *Crotalidæ*, the eggs are retained in the oviduct until the embryo is fully developed These snakes bring forth living young, and are called "ovo-viviparous"

Classification The order of snakes may be divided into the following sub-orders and families or groups

First Sub order —**Hopoterodontes**

Small burrowing snakes, with a cylindrical body, which is nearly of the same thickness from its anterior to its posterior extremity, and is covered with smooth polished scales of the same size in its whole circumference No mental groove Head small, not distinct from the trunk, with imbricate scale like scutes Eye rudimentary Mouth very narrow, at the lower side of the head, armed with small teeth in one jaw only

Family 1 TYPHLOPIDÆ —Teeth in the upper jaw only

Genera *Typhlina, Onychocephalus, Typhlops* (see figs 6, 7)

Family 2 STENOSTOMATIDÆ —Teeth in the lower jaw only

Genera *Stenostoma, Stagnodon*

Second Sub-order —**Ophidii Colubriformes**

Innocuous snakes Teeth in both jaws, none of the anterior being grooved or perforated Scales more or less differentiated A mental groove is generally present Eye developed

Family 1 TORTRICIDÆ —Body cylindrical, with a rounded head not distinct from the neck, tail very short Rudiments of hind limbs hidden in a small groove on each side of the vent Scales rounded, polished, those of the ventral series but little enlarged, only one pair of frontals, six upper labials Eye small Mouth of moderate width, teeth few in number, sub-equal in size

Genera *Ilysia* (tropical America), *Cylindrophis* (India)

Family 2 XENOPELTIDÆ —Body cylindrical, with a rounded head not distinct from the neck, tail short No rudimentary hind limbs Scales rounded, polished, ventral shields well differentiated, two pairs of frontals, occiput covered with five shields Eye small Mouth of moderate width, teeth numerous, sub-equal

One genus, from the Indian region *Xenopeltis*

Family 3 UROPELTIDÆ (Rough Tails) —Body cylindrical, with a short head not distinct from the neck, tail very short, truncated or scarcely tapering, frequently terminating in a rough naked disk or covered with keeled scales Scales rounded and polished, those of the ventral series being always somewhat larger than the rest, only one pair of frontals, four upper labials Eye very small Mouth of moderate width, teeth few in number, small, sub equal, none on the palate Mental groove generally absent Small burrowing Indian snakes

Genera *Rhinophis, Uropeltis, Silybura, Plectrurus, Melanophidium*

Family 4 CALAMARIIDÆ —Small snakes, with a rather rigid body, the short head not distinct from the neck, tail more or less short Scales in from thirteen to seventeen series, ventral shields well developed, generally less than 200 in number, the normal number of head-shields always reduced by two or more of them being confluent Cleft of the mouth of moderate width, nostril lateral, palatine teeth present

African genera *Homalosoma, Calamelaps, Prosymna, Opisthotropis, Xenocalamus, Amblyodipsas, Elapops, Urobelus, Uriechis* Europeo Asiatic genera *Rhynchocalamus, Psilosoma* Indian genera *Calamaria, Macrocalamus, Typhlogeophis, Xylophis, Oxycalamus, Brachyorrhos, Elapoides, Rhinosimus, Aspidura, Haplocercus, Achalinus* (Japan) North American genera *Carphophis, Conocephalus, Streptophorus, Contia* Tropical American genera *Homalocranium, Arrhyton, Rhegnops, Colobognathus, Geophidium, Catostoma, Stenognathus, Leptocalamus, Chersodromus, Elapomorphus, Cercocalamus, Microdromus, Stenorhina, Rhinostoma, Rhynchonyx* Genus with wide distribution *Geophis*

Family 5 OLIGODONTIDÆ —Body rather rigid, covered with smooth rounded scales, head short, not distinct from neck, and nearly always with symmetrical arrow-shaped markings above Ventral scutes broad, rostral shield large, more or less produced backwards Maxillary teeth few in number, the hindmost enlarged, not grooved Indian

Genera *Oligodon, Simotes*

Family 6 COLUBRIDÆ —This family comprises the majority of the non-venomous snakes and the least specialized forms Their body of moderate length compared to its circumference, flexible in every part, the head, trunk, and tail—in fact all parts—well proportioned, nostril lateral, teeth numerous in the jaws and on the palate, but without fangs in front or in the middle of the maxillary Double row of sub-caudals This family may be divided in accordance with the general habitus or mode of life into several groups which, however, are connected by numerous intermediate forms

The group of (i) Ground Colubrides, *Coronellina*, consists of small forms, generally of brilliant coloration, and comprises the following genera —

Genera with wide distribution *Ablabes, Cyclophis, Tachymenis, Coronella, Liophis* African *Psammophylax, Dityophis* Indian *Megablabes, Nymphophidium, Odontomus* Tropical American *Erythrolamprus, Pliocercus, Hypsirhynchus*

The group of (ii) True Colubrides, *Colubrina*, are land snakes, which swim well when driven into the water, or climb when in search of food, they are of moderate or rather large size

Genera with wide distribution *Coluber, Elaphis, Ptyas, Zamenis* African genera *Xenurophis, Herpetæthiops, Scaphiophis* Indian genera *Compsosoma, Xenelaphis, Cynophis, Lielaphis, Lytorhynchus* Europeo Asiatic *Rhinechis* North-American *Pituophis* South American *Spilotes* Australian *Zamenophis*

The group of (iii) Bush Colubrides, *Dryadina*, leads up to the true Tree snakes, its members having a more or less elongate and compressed body, frequently of green colour, they are more numerous in the New than in the Old World, and belong to the following

Genera *Dromicus, Herpetodryas, Herpetoreas, Philodryas, Diplotropis, Zaocys, Dryocalamus*

Finally, the group of (iv) Freshwater Colubrides, *Natricina*, are generally neither elongate nor compressed, and possess frequently keeled scales They freely enter water in pursuit of their prey,—chiefly frogs and fishes

Genera with wide distribution *Tropidonotus, Heterodon* African *Grayia, Neusterophis, Limnophis, Hydræthiops, Macrophis* Indian *Xenochrophis, Prymnomiodon, Atretium* North-American *Ischnognathus* South-American *Xenodon, Tomodon*

Family 7 HOMALOPSIDÆ (Freshwater Snakes) —Body of moderate length, cylindrical or slightly compressed, head rather thick, broad, not very distinct from neck, tail strong, of moderate length Ventral scutes rather narrow, double row of sub-caudals Eye small Nostrils on the upper surface of the head, small, provided with a valve, nasal shields enlarged at the expense of the anterior frontals, which are frequently confluent into a single shield The other head shields may deviate from the usual arrangement

Indian genera *Fordonia, Cantoria, Cerberus, Hypsirhina, Ferania, Homalopsis, Hipistes, Herpeton* (see fig 8), *Gerarda, Tachyplotus* American genera *Calopisma, Helicops, Hydrops, Tachynectes, Hydromorphus*

Family 8 PSAMMOPHIDÆ (Desert Snakes) —Loreal region very concave Scales smooth, double row of sub caudals Cleft of the mouth wide, nostril lateral Eye of moderate size Shields of the head normal, posterior frontals rounded or angular behind, vertical narrow, supraciliaries prominent Loreal present One of the four or five anterior maxillary teeth longer than the others, and the last grooved Old World

Genera *Psammophis, Cœlopeltis, Taphrometopon, Rhagerrhis Psammodynastes, Mimophis*

Family 9 RHACHIODONTIDÆ (Egg-Eaters) —Body of moderate dimensions, head short, deep Eyes small, pupil round Scales strongly keeled, in twenty three or twenty-five series Maxillary teeth very small and few in number, the lower spinous processes of the posterior cervical vertebræ penetrate the œsophagus and act as supplementary teeth African

One genus *Dasypeltis* (see fig 9)

Family 10 DENDROPHIDÆ (Tree Snakes) —Body and tail much compressed or very slender and elongate, head generally elongate and distinct from the very slender neck, snout rather long, obtuse or rounded in front Cleft of the mouth wide Eye of moderate size or large, with round pupil Shields of the head normal, scales

geneially narrow and much imbricate, ventral scutes keeled laterally, double iow of sub-caudals No large fang either in fiont oi in the middle of the upper jaw

Afiican genera *Bucephalus, Hapsidophrys, Rhamnophis, Philothamnus, Ithycyphus* Indian and Australian genera *Gonyosoma, Phyllophis, Dendiophis, Chiysopelea* Tiopical American *Ahætulla*

Family 11 DRYOPHIDÆ (Whip Snakes) —Body and tail excessively slender and elongate, head veiy naiiow and long with tapeiing snout, which sometimes is pioduced into a longer or shortei appendage Mouth very wide Eye of moderate size, generally with a hoiizontal pupil Scales very narrow, much imbricate, double row of sub caudals Posteiior maxillary teeth giooved

Geneia *Tropidococcyx, Clodophis, Diyophis, Tragops, Passeiita* (see fig 10), *Langaha*

Family 12 DIPSADIDÆ —Body much compiessed, elongate oi of moderate length, head short, broad behind, with shoit rounded snout distinct fiom neck Eye laige, geneially with veitical pupil Cleft of the mouth wide Scales of the veitebial seiies fiequently enlarged Dentition strong, fiequently with enlarged anterior and posterior maxillaiy teeth

Genera *Chamætortus, Leptodiia, Tiopidodipsas, Hemidipsas, Thamnodynastes, Dipsas, Dipsadoboa, Rhinobothiyum, Pythonodipsas*

Family 13 SCYTALIDÆ —Head, tiunk, and tail of moderate dimensions Eye of moderate size, with elliptical pupil Scales smooth, in seventeen or nineteen rows; anal entire, single or double iow of sub-caudals Posterioi maxillary teeth grooved, anterior ones equal in length

Geneia *Scytale, Oxyihopus, Hologerrhum, Pseudoxyihopus, Rhinosimus*

Family 14 LYCODONTIDÆ Body of modeiate length oi iather elongate, snout generally depiessed, flat, and elongate Eye iather small, often with veitical pupil Upper head-shields regular, with the posteiior frontals enlaiged Maxillaiy with a fang in fiont, but without posterioi grooved tooth

Afiican geneia *Boodon, Holuiophohs, Alopecion, Lycophidium, Bothrophthalmus, Bothiolycus, Lycodryas, Hormonotus, Simocephalus, Lampiophis* Indian genera *Lycodon, Dinodon, Tetragonosoma, Leptorhytaon, Ophites, Cercaspis, Ulupe.*

Family 15 AMBLYCEPHALIDÆ (Blunt Heads) —Body compiessed, slender, and of modeiate length, head shoit, thick, veiy distinct fiom neck, nostiil in a single shield Eye with veitical pupil Cleft of the mouth naiiow and not very extensible Scales smooth or faintly keeled, those of the vertebral series generally enlaiged Maxillaiy dentition feeble, no giooved tooth

Indian genera *Dipsadomorus, Amblycephalus, Paieas, Asthenodipsas, Elachistodon* South-Ameiican geneia *Leptognathus, Opisthophis*

Family 16 ERYCIDÆ (Sand Snakes) —Body of modeiate length, cylindrical, coveied with small short scales, tail veiy short, with a single series of sub-caudals Eye small, with veitical pupil None of the labials are pitted Anteiioi teeth longest Adult individuals of some of the species with rudiments of hind limbs

Geneia *Eryx, Cuisoria, Gongylophis, Bolyeria, Erebophis, Lichanura, Calabaria, Wenona, Charina*

Family 17 BOIDÆ —Body and tail of modeiate length oi elongate, tail piehensile, snout rounded in fiont Eye with veitical pupil Scales in numeious seiies, single or double row of subcaudals In some of the geneia the uppei and lowei labials are pitted Teeth stiong, unequal in size, none grooved, no inteimaxillaiy teeth Rudiments of hind limbs aie geneially piesent

Geneia *Boa* (see fig 11), *Pelophilus, Xiphosoma, Coiallus, Epiciates, Chilabothrius, Enygrus, Leptoboa, Ungalia, Trachyboa*

Family 18 PYTHONIDÆ (Rock Snakes) —Distinguished from the piecedıng family by the piesence of inteimaxillaiy teeth

Genera *Python* (see fig 12), *Moiclia, Chondropython, Liasis, Aspidiotes, Nardoa, Loxocemus*

Family 19 ACROCHORDIDÆ (Wait Snakes) —Body of modeiate length, covered with small, non-imbiicate, tubeiculai oi spiny scales, tail iather short, piehensile Head coveied with scales like the body, nostiils close togethei, at the top of the snout Eye small Teeth shoit, stiong, sub-equal in size Aquatic Vivipaious India

Geneia *Aciochoidus, Cheisydrus*

Family 20 XENODERMIDÆ —Distinguished fiom the pieceding family by possessing bioad vential and sub caudal scutes

One genus *Xenodeimus* (Java) ? *Nothopsis* (Central Ameiica)

Thiid Sub-oider —**Ophidii Colubriformes Venenosi**

Venomous Colubiine snakes An erect grooved oi perforated tooth in fiont of the maxillaiy which is not capable of iotation in its transverse axis Scales differentiated A mental gioove

Family 1 ELAPIDÆ —Tail conical, tapeiing Head with shield loreal absent Venom fang grooved maxillary long, with short teeth behind the fang

Genus with wide distiibution *Naja* (see fig 13) Indian geneia *Callophis, Megæiophis, Hemibungaius, Xenurelaps, Bungaius, Ophiophagus* Afrıcan genera *Pæcilophis, Elapsoidea, Cyitophis* South-Ameiican genus *Elaps* (see fig 14) Australian genera *Veimicella, Biachysoma, Neelaps, Brachyurophis, Rhinelaps, Diemenia, Cacophis, Hoplocephalus, Tiopidechis, Pseudechis, Pseudonaja, Pseudohaje, Ogmodon*

Family 2 ATRACTASPIDIDÆ —Body cylindiical, of moderate pioportions, tail short Head shoit, not distinct fiom neck Mouth narrow Maxillary shoit, with perforated poison-fang, without othei teeth behind Afiica

Genus *Atiactaspis*

Family 3 CAUSIDÆ —Body of modeiate proportions, tail modeiate oi iather shoit Head distinct from neck Mouth wide Maxillary shoit, with perforated poison-fang, without othei teeth behind

Afiican geneia *Sepedon, Causus* South-Ameiican *Dinodipsas*

Family 4 DINOPHIDÆ (Venomous Tiee Snakes) —Body and tail mnch elongate head distinct from neck Mouth wide A perfoiated poison-fang, without othei teeth behind. Afiica

Genus *Dinophis (Dendraspis)*

Family 5 HYDROPHIDÆ (Sea Snakes) —Body geneially compiessed, and without broad ventıal scutes, tail compiessed, ruddeishaped Nostiils directed upwaids Poison-fangs small, grooved Viviparous

Genera *Platuius, Aipysurus, Disteiia, Acalyptus, Hydiophis, Enhydrina, Pelagophis, Pelamis* (see fig 15)

Fourth Sub order —**Ophidii Viperiformes**

Viperine snakes Maxillary veiy short, capable of iotation in its transveise axis, and aimed with a single long tooth, which is perforated Viviparous

Family 1 VIPERIDÆ (Vipers) —Loreal region flat, without pit

Old World geneia *Vipera, Ceiastes, Daboia, Echis* (see fig 17), *Atheiis* Austialian *Acanthophis*

Family 2 CROTALIDÆ (Pit Vipeis, Rattlesnakes) —Loieal iegion with a pit

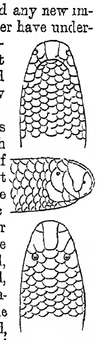
Old World geneia *Halys, Hypnale, Tiimeiesurus* (see fig 18), *Calloselasma, Peltopeloi* New World geneia *Cenchiis, Bothiops, Bothiiopsis, Bothiiechis (Rhinoceiophis), Atiopos, Trigonocephalus, Lachesis, Ciotalophoius, Ciotalus* (see fig 16)

This list, from which many genera or sub-genera that are not well defined have been excluded, will give an idea of the great vaiiety of forms by which the Ophidian type is iepresented at the present peiiod Additions, more or less numerous, are made to it every year, but the

FIG 6 —*Typhlops bothriorhynchus* from India

discoveries of late years have not revealed any new important modifications of structure, but rather have undermined the distinctions hitherto made between genera, groups, and families, so that it would appear as if we were acquainted with all the principal forms of snakes now living

We have now to add some notes on snakes to which special interest is attached, or which are most frequently brought to the notice of the observer or readei The snakes most remote from the true Ophidian type are the members of the first family, *Typhlopidæ* They are a small degraded form, adapted for buiiowing and leading a subteiianean life like woims Their body is cylindrical, rigid, covered with smooth, shoit, highly polished, and closely fitting scales, without broad ventral scutes, tail very short, head joined to the trunk without neck-like constriction behind, and shoit, rounded, or with an acute rostral shield,—the principal instiument foi burrowing in loose soil or mould Their eye is quite rudimentary and can only give them a general perception of light Their mouth is narrow, small, armed with but a few teeth in one of the jaws, and not distensible, allowing them only to feed on very small



Burrowing snakes

FIG 7 —Three views of head of *Typhlops braminus* (India), magnified

animals, such as worms, larvæ, and burrowing insects. They are found in all tropical countries and the parts adjoining, and some of the small species have a wide range, having been probably transported by accident on floating objects to distant countries. Some species attain to a length of 24 inches, whilst others scarcely grow to one-fourth that size.

An almost unbroken series leads from these degraded worm-like snakes to the typical *Colubridæ*, of which the Smooth Snake of Europe (*Coronella*), the Corn Snake of North America (*Coluber*), the Rat Snake of India and South America (*Ptyas*, *Spilotes*), Æsculapius's Snake of the south of Europe, the common Ring Snake of England (*Tropidonotus*), are well-known representatives.

Smooth snake.

The Smooth Snake (*Coronella lævis*) is common in the warmer parts of Europe, extending northwards into the New Forest district of England. In coloration, general habits, and size it somewhat resembles the viper; but, although it is rather fierce and ready to bite when caught, it is quite harmless and soon becomes tame in captivity. The shields on its head readily distinguish it from the viper. Its chief food consists of lizards, and it attains a length of 2 feet.

Indian rat snakes.

The Indian Rat Snakes (*Ptyas mucosus* and *P. korros*) are two of the most common species of India, the former inhabiting India proper and Ceylon, the latter the East Indian Archipelago, Siam, and southern China. *P. mucosus* is a powerful snake, attaining to a length of 7 feet, the tail being one-third or rather more; it is easily recognized by having three loreal shields, one above the other two; its scales are arranged in seventeen rows. Its food consists of mammals, birds, and frogs; and it frequently enters the dwellings of man, rendering itself useful by clearing them of rats and mice. It is of fierce habits, always ready to bite; when irritated it utters a peculiar diminuendo sound, not unlike that produced by a tuning-fork when struck gently.

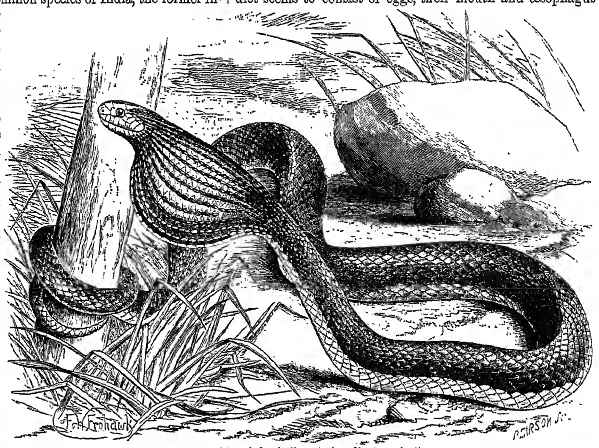


Fig. 9.—*Dasypeltis unicolor*, in the act of swallowing a fowl's egg.

Æsculapius's snake.

Æsculapius's Snake (*Coluber æsculapii*) was probably the species held in veneration by the ancient Romans. It grows to a length of about 5 feet, is of mild disposition, and can be readily domesticated. Its original home is Italy, where it is common, but it has extended its range northwards across the Alps into the south of France, and thence into northern Spain. Following the course of the Inn and the Danube, it has reached the Black Sea; and it is also now common in several localities along the middle parts of the Rhine. From direct observations made during the last twenty years there can be no doubt that it is still extending its range. Naturalists believed formerly that the occurrence of this snake at widely distant and isolated localities was due to its introduction by the Romans, who had settlements in those localities.

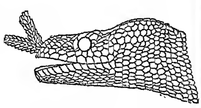

Fig. 8.—Head of *Herpeton tentaculatus*.

British ring snake.

The common British Snake or Ring Snake (*Tropidonotus natrix*) is extremely common all over Europe (except in the northern parts), and belongs to a genus extremely rich in species, which are spread over Europe, Asia, India, Australia, and North America. Some of the species, like the Indian *T. quincunciatus* and *T. stolatus* and the North-American *T. ordinatus*, are perhaps more abundant as regards the number of individuals than any other snake. *T. natrix* is easily recognized even at a distance by two yellow or white spots which it has behind its head. It grows rarely to a length of 4 feet; it never bites, and feeds chiefly on frogs and toads. Its eggs, which are of the size and shape of a dove's egg, and from fifteen to thirty in number, are deposited in mould or under damp leaves, and are glued together into one mass.

Egg-eaters.

A very peculiar genus of snakes, *Dasypeltis*, represented by three species only, is the type of a separate family and is restricted in its distribution to Central and South Africa. In Cape Colony these snakes are well known under the name of "eyervreter," *i.e.*, "egg-eaters." Their principal diet seems to consist of eggs, their mouth and œsophagus being so distensible that an individual scarcely 20 inches in length, and with a body not surpassing a man's little finger in circumference, is able to swallow a hen's egg. The teeth in the jaws are very small and few in number; but the inferior processes of the posterior cervical vertebræ are prolonged and provided with a cap of enamel, and penetrate the œsophagus, forming a kind of saw. As the egg passes through the œsophagus its shell is broken by this apparatus, and, whilst its contents are thus retained and swallowed without loss, the hard fragments of the shell are rejected. This peculiar apparatus occurs also in another snake, *Elachistodon*, which belongs to the Indian fauna and has been referred (provisionally) to the family *Amblycephalidæ*. Also two prominences at the base of the skull of the Indian Coronelline *Nymphophidium* probably have the same function. Besides the snakes mentioned, we have observed species of *Dipsas* feeding on eggs of parrots, the eggs reaching the stomach entire, as these

snakes lack a special apparatus for breaking the shell. The Indian cobra also is said to rob birds of their eggs.

Tree snakes. The Tree Snakes (*Dendrophidæ*) are among the greatest ornaments of tropical fauna. The graceful form of their body, the elegance and rapidity of their movements, and the exquisite beauty of their colours have been the admiration of all who have had the good fortune to watch them in their native haunts. The majority lead an exclusively arboreal life; only a few descend to the ground in search of their food. They prey upon every kind of

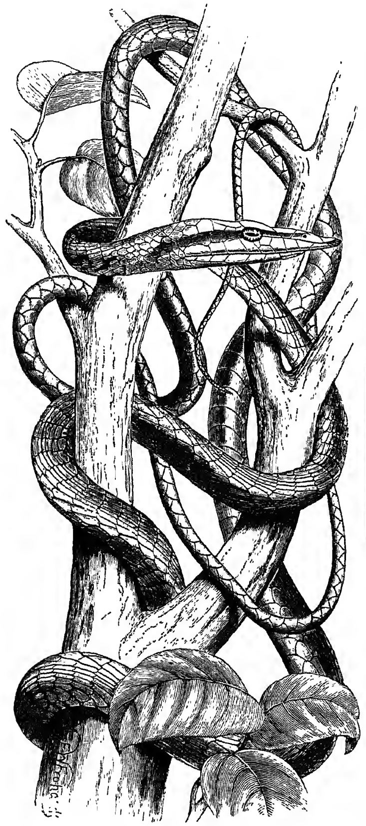

FIG. 10. Indian whip snake. *Passerita mycterizans.*

arboreal animal,—birds, tree-frogs, tree-lizards, &c. All seem to be diurnal, and the larger kinds attain to a length of about 4 feet. The most beautiful of all snakes are perhaps certain varieties of *Chrysopelea ornata*, a species extremely common in the Indian Archipelago and many parts of the continent of tropical Asia. One of these varieties is black, with a yellow spot in the centre of each scale; these spots are larger on the back, forming a series of tetrapetalous flowers; the head is similarly ornamented. Another variety has a red back, with pairs of black cross-bars, the bands of each pair being separated by a narrow yellow space; sides brown, dotted with black; belly dark green, the outer portion of each ventral shield being yellow, with a blackish spot.

The features by which the tree snakes are distinguished Whip snakes are still more developed in the family of Whip Snakes (*Dryophidæ*), whose excessively slender body has been compared to the cord of a whip. Although arboreal, like the former, they are nocturnal in their habits, having a horizontal instead of a round pupil of the eye. They are said to be of a fierce disposition, feeding chiefly on birds; and indeed a long tooth placed about the middle of the maxillary seems to assist them much in penetrating the thick covering of feathers and in obtaining a firm hold on their victims. In some of the species the elongate form of the head is still more exaggerated by a pointed flexible appendage of the snout (*Passerita*), which may be nearly half an inch in length, and leaf-like, as in the Madagascar *Langaha*.

Lycodontidæ. The well-defined family of *Lycodontidæ* is chiefly composed of ground snakes, but a few of its members have a sufficiently elongate body to indicate arboreal habits. The Indian genera are principally reptilivorous, while the African prey upon mice, rats, and other small nocturnal mammals. Scarcely any other snake is so common in collections as the Indian *Lycodon aulicus*, which inhabits the continent of India and Ceylon, some of the islands of the East Indian Archipelago (Timor), and the Philippines. It occurs in many varieties, but generally is of a uniform brown, or with some whitish crossbands on the anterior part of the body. Although only 2 feet long, it is a fierce snake, which when surprised bites readily, but its bite is innocuous.

Boas. The *Boidæ* are so similar in their habits to the Pythons (see PYTHON, vol. xx. p. 144) that it is sufficient to refer in a few words to the species most frequently mentioned in the literature dealing with the fauna of the virgin forests of tropical America. The real *Boa constrictor* is common from the northern parts of Central America to southern Brazil, and is frequently brought alive to Europe. Generally it is only about 7 feet long; but the present writer has seen skins of specimens which must have been nearly twice that length. The gigantic snakes of from 20 to 30 feet in length mentioned in books of South-American travels belong to a different species, the Anaconda or *B. murina*, which has the same habits as the *B. constrictor*, haunting the banks of rivers and lakes and lying in wait for peccaries, deer, and other mammals of similar size, which come to the water to drink. It has already been stated (see REPTILES) that this family is not restricted to South America, but is well represented in the tropical Pacific region. The Boid most common in that region is *Enygrus*, which ranges all over New Guinea, the Fiji Islands, the Solomon group, Samoa, and many other Pacific islands; it is of small size, scarcely 30 inches long.

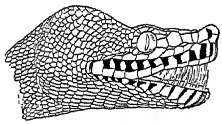

FIG. 11.—Head of *Boa canina*.

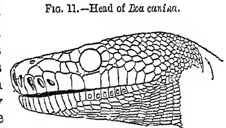

FIG. 12.—Head of *Python reticulatus*.

We pass now to the Venomous Colubrine snakes, that is, snakes which combine with the possession of a perfect poison apparatus the scutellation and general appearance of the typical non-poisonous snakes. It is a remarkable

fact, however, that the snakes of this sub-order agree in the absence of the small shield on the side of the snout, the so-called "loreal"; and this is all the more remarkable as the same shield has by no means a similar taxonomic significance in the non-venomous snakes, many of which are without it, although it is present in the majority. **Cobras.** No snake of this sub-order is more widely known and more dreaded than the species of the genus *Naja* or cobras. Probably more than two species should be distinguished; but the two which cause the greatest loss of life are the Indian Cobra or Cobra di Capello or Naga (*N. tripudians*) and the African Cobra (*N. haje*). In a report to the Bengal Government the commissioner of Burdwan states that he has ascertained from statistics collected during a series of nine years that above 1000 persons are killed annually by snakes in a population of nearly 6,000,000, the majority being bitten by the cobra, which is by far the most common. And other districts in India seem to suffer still more severely, although it is difficult to obtain information of all the accidents caused by snakes. The cobra is found throughout India, extending westwards to the Sutlej and eastwards to the Chinese island of Chusan; in the Himalayan alps it reaches an altitude of 8000 feet; it occurs also in abundance in many of the islands of the East Indian Archipelago, and is here joined by another apparently distinct species (*N. sputatrix*), whilst in the central portions of Asia, which geographically separate it from the African cobra, it is replaced by a fourth, *N. oxiana*. The Indian cobra appears in many varieties of colour, which are distinguished by separate names in the nomenclature of the Hindu snake-charmers. The ground colour varies from a yellowish olive to brown and to black with or without whitish or white crossbands on the back, and with from one to four or without any black bars across the anterior part of the belly. Some of these varieties are characterized by a pair of very conspicuous white, black-edged spectacle-like marks on the expansible portion of the neck, called the "hood"; but these marks may lose their typical form and become merely a pair of ocellated spots, or be confluent into a single ocellus, or may be absent altogether. All these varieties, however, are the same species, which generally attains to a length of 5 feet, but sometimes exceeds 6. It is more of nocturnal than of diurnal habits, feeding on every kind of small Vertebrates and also eating eggs. The cobra and the other species of this genus have the anterior ribs elongated, and can move them so as to form a right angle with the spine. The effect of this movement is the dilatation of that part behind tho head which is generally ornamented with the spectacles or ocelli. When the cobra is irritated or excited it spreads its "hood," raising the anterior third of the body from the ground, gliding along with the posterior two-thirds, and holding itself ready to strike forwards or sidewards. All accounts agree that the cobra is not aggressive unless interfered with or impelled by a sense of danger. It is said to share the habitations of man where superstition prevents people from molesting it, and to live peaceably with the inmates; and there is no doubt that professional snake-charmers exercise a certain control over them, for, although generally the cobras exhibited are rendered harmless by the removal of the poison-fangs, they very rarely attempt to injure their masters even after the fangs have been reproduced. Of the natural enemies of the cobra, the mongoos (see vol. xii. p. 629) does probably the greatest amount of execution; many are destroyed by fowls shortly after being hatched. The cobra is oviparous, depositing from eighteen to twenty-five eggs in the year. The African cobra is extremely similar to its Indian congener in size, form, and habits, and varies in coloration to the same extent. It inhabits the whole of Africa, from Egypt to the Cape of Good Hope, but has been nearly exterminated in the cultivated districts of the Cape Colony. One of its greatest enemies (as indeed of all snakes) is the secretary bird of South Africa (*Serpentarius*), which, therefore, is protected by law. Accidents from this snake do not appear to be of common occurrence; they happen more frequently to domestic animals than to man. In the Egyptian hieroglyphics the cobra occurs constantly with the body erect and hood expanded; its name was *ouro*, which signifies "king," and the animal appears in Greek literature as *ouraios* and *basiliscus*. With the Egyptian snake-charmers of the present day the cobra is as great a favourite as with their Hindu colleagues. They pretend to change the snake into a rod, and Geoffroy St-Hilaire maintains that the supple snake is made stiff and rigid by a strong pressure upon its neck, and that the animal does not seem to suffer from this operation, but soon recovers from the cataleptic fit into which it has been temporarily thrown.

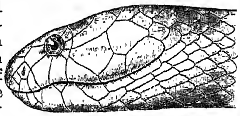

FIG. 13.—Head of cobra.

Ophiophagus elaps. More dangerous than either of the species of cobra, which it exceeds in size, is *Hamadryas* or *Ophiophagus elaps*, the largest poisonous snake of the Old World, attaining to a length of 14 feet. It has almost the same geographical range as the cobra, but is much scarcer; it greatly resembles it also in general habit, but differs from it in scutellation, possessing three large shields behind the occipitals. It has the reputation of occasionally attacking and pursuing man; its favourite food consists of other snakes. Snake-charmers prize it highly for exhibition on account of its size and its docility in captivity, but are always careful to extract the fangs. It lives in captivity for many years.

Bungarums. The species of *Bungarus*, four in number, are extremely common in India, Burmah, and Ceylon, and are distinguished by having only one row of undivided sub-caudal shields. Three of the species have the body ornamented with black rings, but the fourth and most common (*B. cœruleus*), the "krait" of Bengal, possesses a dull and more uniform coloration. The fangs of the bungarums are shorter than those of the cobras, and cannot penetrate so deeply into the wound. Their bite is therefore less dangerous and the effect on the general system slower, so that there is more prospect of recovery by treatment. Nevertheless, according to Fayrer, the krait is probably, next to the cobra, the most destructive snake to human life in India.

Narrow-mouthed species. Several genera of this sub-order of Venomous Colubrines are similar to the innocuous *Calamariidæ* in general habit; that is, their body is of a uniform cylindrical shape, terminating in a short tail, and covered with short polished scales; their head is short, the mouth rather narrow, and the eye small. They are the tropical American *Elaps*, the Indian *Callophis*, the African *Pœcilophis*, and the Australian *Vermicella*. The majority are distinguished by the beautiful arrangement of their bright and highly ornamental colours; many species of *Elaps* have the pattern of the so-called coral snakes, their body being encircled by black, red, and yellow rings,—a pattern which is peculiar to snakes, venomous as well as non-venomous, of the fauna of tropical America. Although the poison of these narrow-mouthed snakes is probably as virulent as that of the preceding, man has much less to fear from them, as they bite only under great provocation. Moreover, their bite must be frequently without serious effect, owing to their narrow mouth and the small size of their poison-fangs. They are also comparatively of small size, only a few species rarely exceeding a length of 3 feet.

Australian poisonous colubrine snakes.

No part of the world possesses so many snakes of this sub-order as Australia, where, in fact, they replace the non-venomous Colubrine snakes. Of the genus *Diemenia* six species, of *Pseudechis* three, and of *Hoplocephalus* some twenty species have been described, and many of them are extremely common and spread over a considerable area.

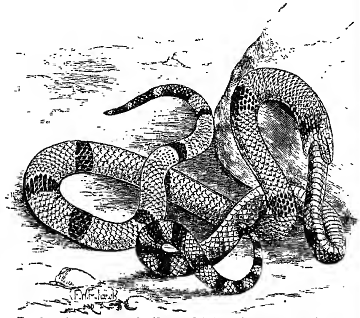

FIG. 14.—A poisonous snake (*Elaps fulvius*) swallowing a non-poisonous (*Homalocranium semicinctum*).

Fortunately the majority are of small size, and their bites are not followed by more severe effects than those from the sting of a hornet, especially if the simple measures of sucking or cauterizing the wound are resorted to. Only the following are dangerous to man and larger animals:—the Brown Snake (*Diemenia superciliosa*), found all over Australia and attaining to a length of over 5 feet; the Black Snake (*Pseudechis porphyriacus*), likewise common throughout the Australian continent, especially in low marshy places, and upwards of 6 feet in length; it is black, with each scale of the outer series red at the base; when irritated it raises the fore part of its body and flattens out its neck like a cobra; the Brown-banded Snake (*Hoplocephalus curtus*), with a similar distribution, and also common in Tasmania, from 5 to 6 feet long, and considered the most dangerous of the tribe.[1]

African *Causidæ*.

The small family *Causidæ* contains two African genera well known to and much feared by the inhabitants of South Africa. One, *Sepedon hæmachates*, is named by the Boers "roode koper kapel" or "Ring-Neck Snake," the latter name being, however, often applied also to the cobra. It resembles in colour some varieties of the latter snake, and, like this, it has the power, though in a less degree, of expanding its hood. But its scales are keeled and its form is more robust. It is equally active and courageous, not rarely attacking persons who approach too near to its resting-place. In confinement it evinces great ferocity, opening its mouth and erecting its fangs, from which the poison is seen to flow in drops. During such periods of excitement it is even able, by the pressure of the muscles on the poison-duct, to eject the fluid to some distance; hence it shares with the cobra a third Dutch name, that of "spuw slang" (Spitting Snake). It grows to a length of 2 or 3 feet. The second African snake of this family is the "schapsticker" (Sheep Stinger), *Causus rhombeatus*. It is extremely common in South Africa and extends far northwards along the eastern as well as western coast. It is of smaller size than the preceding and causes more injury to animals, such as sheep, dogs, &c., than to man. It varies in colour, but a black mark on the head like an inverted V remains nearly always visible.

[1] Good descriptions and figures of all these snakes are given in Krefft's *Snakes of Australia*, Sydney, 1869, 4to.

Dinophidæ.

The *Dinophidæ* are the arboreal type of this sub-order; they resemble non-venomous tree snakes in their gracile form, narrow scales, generally green coloration, and in their habits; nevertheless the perfect development of their poison-apparatus, their wide mouth, their large size (they grow to a length of 7 feet), leave no doubt that they are most dangerous snakes. They do not appear to be common, but are spread over all districts of tropical Africa in which vegetation flourishes.

Sea snakes.

Of Sea Snakes (*Hydrophidæ*) some fifty species are known. All are inhabitants of the tropical Indo-Pacific ocean, and most numerous in and about the Persian Gulf, in the East Indian Archipelago, and in the seas between southern China and northern Australia. One species which is extremely common (*Pelamis bicolor*), and which is easily recognized by the black colour of its upper and the yellowish tints of its lower parts (both colours being sharply defined), has extended its range westwards to the sea round Madagascar, and eastwards to the Gulf of Panama. Sea snakes are viviparous and pass their whole life in the water; they soon die when brought on shore. The most striking feature in their organization is their elevated and compressed tail. The hind part of the body is compressed, and the belly forms a more or less sharp ridge. The ventral shields would be of no use to snakes moving through a fluid, and therefore they are either only rudimentary or entirely absent. The genus *Platurus*, however, is a most remarkable exception in having broad ventral shields; probably these serpents frequently go on shore, sporting or hunting over marshy ground. In many sea snakes the hind part of the body is curved and prehensile, so that they are able to secure a hold by twisting this part of the body round corals, seaweed, or any other projecting object. Their tail answers all the purposes of the same organ in fish, and their motions in the water are almost as rapid as they are uncertain and awkward when the animals are removed out of their proper element. Their nostrils are placed quite at the top of the snout, as in crocodiles and in fresh-water snakes, so that they are enabled to breathe whilst the entire body and the greater part of the head are immersed in the water. These openings are small and subcrescentic, and are provided with a valve interiorly, which is opened during respiration, and closed when the animal dives. They have very capacious lungs, extending backwards to the anus, and consequently all their ribs are employed in performing the respiratory function; by retaining air in these extensive lungs they are able to float on the surface of the water without the slightest effort, and to remain under water for a considerable length of time. The scales of sea snakes are frequently very different from those of other snakes: they overlap one another in only a few species; in others they are but little imbricate and are rounded behind; and in others they are of a subquadrangular or hexagonal form, placed side by side, like little shields. The less imbricate they are the more they have lost the polished surface which we find in other snakes, and are soft, tubercular, sometimes porous. Sea snakes shed their skin very frequently; but it peels off in pieces as in lizards, and not as in the fresh-water snakes, in which the integuments come off entire. Several species are remarkable for the extremely slender

FIG. 15.—Sea snake, *Pelamis bicolor*.

and prolonged anterior part of the body, which is termed the "neck," and terminates in a very small head. The eye is small, with round pupil, which is so much contracted by the light when the snake is taken out of the water that the animal becomes blinded and is unable to hit any object it attempts to strike. The tongue is short, and the sheath in which it lies concealed opens near to the front margin of the lower jaw; scarcely more than the two terminating points are exserted from the mouth when the animal is in the water. The mouth shuts in a somewhat different way from that of other snakes: the middle of the rostral shield is produced downwards into a small lobule, which prevents the water from entering the mouth; there is generally a small notch on each side of the lobule for the passage of the two points of the tongue. Cantor says that when the snake is out of the water and

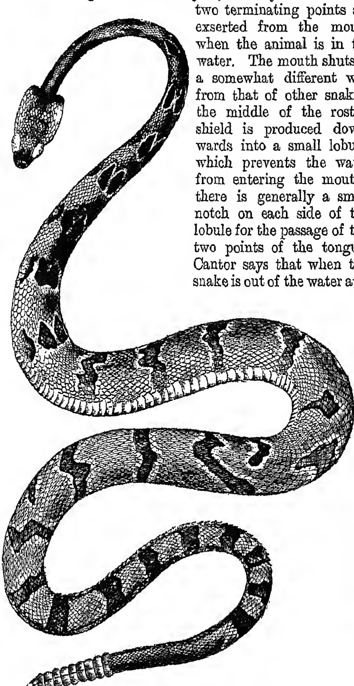

FIG. 16.—Rattlesnake (*Crotalus durissus*).

blinded by the light it freely makes use of its tongue as a feeler. The food of sea snakes consists entirely of small fish; the present writer has found all kinds of fish in their stomach, among them species with very strong spines (*Apogon*, Siluroids). As all these animals are killed by the poison of the snake before they are swallowed, and as their muscles are perfectly relaxed, their armature is harmless to the snake, which commences to swallow its prey from the head, and depresses the spines as deglutition proceeds. There cannot be the slightest doubt that sea snakes belong to the most poisonous species of the whole order. Russell and Cantor have ascertained it by direct observation: tortoises, other snakes, and fish died from their bite in less than an hour, and a man succumbed after four hours. Accidents are rarely caused by them, because they are extremely shy and swim away on the least alarm; but, when surprised in the submarine cavities forming their natural retreats, they will, like any other poisonous terrestrial snake, dart at the disturbing object; and, when out of the water, they attempt to bite every object near them, even turning round to wound their own bodies (Cantor). They cannot endure captivity, dying in the course of two or three days, even when kept in capacious tanks. The greatest size to which some species attain, according to positive observation, is about 12 feet, and therefore far short of the statements as to the length of the so-called sea serpents (see SEA-SERPENT). The largest examples the present writer has seen measured only 8 feet.

Passing over Rattlesnakes (fig. 16) and Vipers, which are treated of in separate articles, we notice the following types of the fourth sub-order, the *Ophidii viperiformes*.

Death adder Australia.

The sole representative of the sub-order in Australia is the Death Adder (*Acanthophis antarctica*), a short stout snake having a similar habitus and habits to vipers and scarcely attaining 3 feet in length. It differs from the

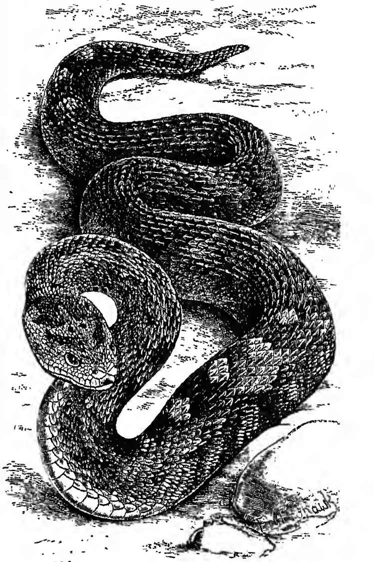

FIG. 17.—*Echis carinata* (India).

other Viperines in having the poison-fang permanently erect. Although much feared, and justly, there is reason to believe that its bite is not so dangerous as has been represented, and that the majority of the fatal accidents ascribed to it are in fact caused by other snakes, probably *Hoplocephalus curtus*. It occurs throughout the whole of Australia, except Tasmania and perhaps South Australia. Generally it is of a uniform grey colour, relieved by some forty dark rings of irregular outline.

Daboia russellii.

The "tic-polonga" of the Singalese (*Daboia russellii*) is beautifully marked: on a light chocolate ground colour three series of large black white-edged rings run along the back and sides of the body, a yellow line borders the surface of the head on each side, the two lines being convergent on the snout. It attains to a length of 50 inches, and occurs locally in abundance in southern India, where it is called "cobra monil"; in Bengal, where it is called "jessur"; in the plains of central India, as well as in the Himalayas to an altitude of 6000 feet; and in Burmah. It is highly poisonous, probably causing many deaths.

Fortunately its loud hissing when disturbed warns those who come within dangerous proximity to it.

chis. The small Viperine snake, *Echis carinata* (fig. 17), which scarcely exceeds a length of 20 inches, shares with the preceding part of its range, being found in the arid districts of southern India, and extending through the intervening parts of Asia to North Africa. It is a desert type, having the lateral scales curiously arranged, strongly keeled, with the tips directed downwards. It produces with their aid a rustling sound. Whilst some observers deny that fatal consequences have resulted from its bite, Dr Imlach reports that it (the "kuppur") is "the most deadly poisonous snake

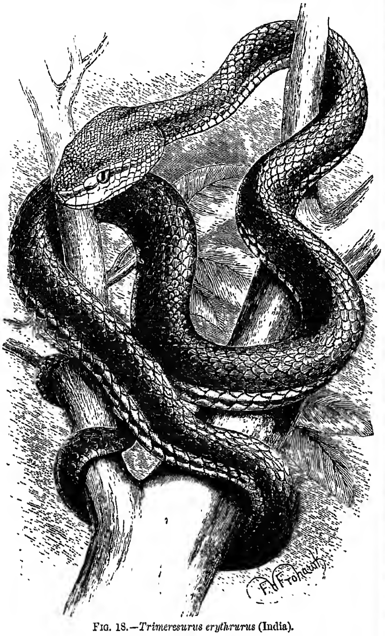

Fig. 18.—*Trimeresurus erythrurus* (India).

in Sind." This desert type is replaced farther south in Africa where vegetation flourishes by a closely allied genus, *Atheris*, which, however, possesses a prehensile tail and vivid coloration and has assumed truly arboreal habits.

it pers ithout ıttles. Of the pit vipers without rattles the largest and most formidable inhabit tropical America. *Trigonocephalus iararaca*, *T. atrox*, and *T. lanceolatus* attain to a length of 6 feet, the first two being common in Brazil and northwards to Central America. The last is limited to some islands in the West Indies, especially Martinique and St Lucia, and is generally known by the name of "fer de lance," which has been given to it from the markings on its head. It infests the sugar-plantations, and has greatly multiplied in consequence of the protection which the cover of the cane-fields afforded it, and the abundance of food supplied by the rats which swarm on the plantations. Thus, whilst it did a certain amount of good by the destruction of vermin, it caused a great number of deaths among the black labourers who were engaged in the fields. These three species of *Trigonocephalus* are surpassed in size by *Lachesis mutus*, probably the largest of terrestrial poisonous snakes, which is said to exceed a length of 10 feet, and is bulky in proportion. It is confined to the hottest parts of tropical America. Similar snakes, but smaller in size, inhabit the warmer and temperate parts of North America, viz., the Copper-head (*Cenchris contortrix*) and the Crater-mocassin (*C. piscivorus*), the former of terrestrial habits, the latter being always found near water and feeding chiefly on aquatic animals. Both are much feared and cause accidents more frequently than rattlesnakes, being more aggressive and striking the intruder without previously warning him of their presence. In the Indian region this type of pit vipers without rattles is likewise well represented, one genus (*Trimeresurus*) being adapted for an arboreal life, like *Atheris* among the *Viperidæ*. Their body (fig. 18) is not more elongate than that of other ground Crotalines, but their tail is prehensile, and their colour generally resembles that of the bright foliage among which they live. Sometimes bright yellow or red markings render these snakes still more pleasing to the eye. Accidents caused by them are of not uncommon occurrence, but fortunately only a few individuals exceed a length of 2 feet, and the consequences of their bite are less to be dreaded than of that of other allied genera. Indeed, numerous cases are on record which show that the constitutional symptoms caused by their poison were of short duration, lasting only from two to forty-eight hours, and being confined to nausea, vomiting, and fever. The bite of larger specimens, of from 2 to 3 feet long, is more dangerous and has occasionally proved fatal. They feed on frogs, mammals, and birds. (A. C. G.)

SNAKE-STONE, a name sometimes applied to Water-of-Ayr stone (see Hone, vol. xii. p. 134). Certain stones reputed, on insufficient grounds, to possess efficacy as antidotes to snake-bites are known as snake-stones (see above, p. 192). The term is also popularly applied to ammonites and certain other fossils which, owing to their spiral shape, were formerly regarded as petrified snakes.

SNEEK, a town of the Netherlands, in the province of Friesland, 18 miles south-south-west of Leeuwarden, with which it is connected by canal and (since 1885) by rail. It is one of the great butter and cheese markets of the country and has communal buildings (1863), a town-house, a court-house, an orphanage, a synagogue, and several churches, in one of which (the Groote or Maartenskerk) is the tomb of the naval hero Lange Pier (Long Peter). The population of the town was in 1870 8456; that of the commune, which numbered only 3253 in 1714, was 9248 in 1870 and 10,496 in 1880.

Sneek appears in the list of Frisian towns in 1268. It was almost reduced to ashes in 1295, and again in 1417 and 1457. In 1515 it was attacked and in 1517 formally besieged by the Burgundians. A diet met in the town in the close of this latter year; and long after, in 1672, Sneek was again the seat of an assembly of the states. In 1570 and in 1825 there were severe inundations.

SNELL, Willebrord (1591-1626), commonly known as Snellius, astronomer and mathematician, was born at Leyden in 1591. In 1613 he succeeded his father as professor of mathematics in the university of Leyden. In 1615 he planned and carried into practice a new method of finding the dimensions of the earth, by determining the distance of one point on its surface from the parallel of another, by means of a triangulation. His work *Eratosthenes Batavus*, published in 1617, describes the method and gives as the result of his operations between Alkmaar and Bergen-op-Zoom a degree of the meridian equal to 55,100 toises = 117,449 yards. (A later recalculation has given 57,033 toises = 121,569 yards, after applying some corrections to the measures indicated by himself.) Snell also distinguished himself as a mathematician, and discovered the law of refraction, which,

however, is generally attributed to Descartes, who made it more widely known. Snell died at Leyden on 30th October 1626.

In addition to the *Eratosthenes Batavus* he published *Cyclometria sive de circuli dimensione* (Leyden, 1621, 4to), and edited *Coeli et siderum in eo errantium observationes Hassiacæ* (ibid., 1618, 4to), containing the astronomical observations of Landgrave William IV of Hesse. About his *Tiphys Batavus s. Histiodromice, de navium cursibus et re navali* (1624), see NAVIGATION, vol. xvii. p. 255, note. A trigonometry (*Doctrina triangulorum*) by him was published a year after his death.

SNIPE (Anglo-Saxon *Snite*, Icelandic *Snípa*, Dutch *Snip*, German *Schnepfe*), one of the commonest Limicoline birds, in high repute no less for the table than for the exciting sport it affords. It is the *Scolopax gallinago* of Linnæus, but by many later writers separated from that genus, the type of which is the WOODCOCK (*q.v.*), and hence has been variously named *Gallinago cœlestis*, *G. media*, or *G. scolopacina*. Though considerable numbers are still bred in the British Islands, notwithstanding the diminished area suitable for them, most of those that fall to the gun are undoubtedly of foreign origin, arriving from Scandinavia towards the close of summer or later, and many will outstay the winter if the weather be not too severe, while the home-bred birds emigrate in autumn to return the following spring. Of late years British markets have been chiefly supplied from abroad, mostly from Holland.

The Snipe is fortunately too well known to need description, for a description of its variegated plumage, if attempted, would be long. It may be noticed, however, as subject to no inconsiderable variation, especially in the extent of dark markings on the belly, flanks, and axillaries, while examples are occasionally seen in which no trace of white, and hardly any of buff or grey, is visible,—the place of these tints being taken by several shades of chocolate-brown. Such examples were long considered to form a distinct species, the *S. sabinii*, but its invalidity is now generally admitted. Other examples in which buff or rust-colour predominates have also been deemed distinct, and to these has been applied the epithet *russata*. Again, a slight deviation from the ordinary formation of the tail, whose rectrices normally number 14, and present a rounded termination, has led to the belief in a species, *S. brehmi*, now wholly discredited. But, setting aside two European species, to be presently noticed more particularly, there are at least a score, more or less nearly allied, belonging to various parts of the world, for no considerable territory is without its representative. Thus North America produces *G. wilsoni*, so like the English Snipe as not to be easily distinguished except by the possession of 16 rectrices, and Australia has *G. australis*, a larger and somewhat differently coloured bird with 18 rectrices. India, while affording a winter resort to multitudes of the common species, which besides Europe extends its breeding range over the whole of northern Asia, has the so-called Pin-tailed Snipe, *G. stenura*, in which the number of rectrices is still greater, varying from 20 to 28, it is said, though 22 seems to be the usual number. This curious variability, deserving more attention than it has yet received, only occurs in the outer feathers of the series, which are narrow in form and extremely stiff, there being always 10 in the middle of ordinary breadth.

Those who only know the Snipe as it shows itself in the shooting-season, when without warning it rises from the boggy ground uttering a sharp note that sounds like *scape, scape*, and, after a few rapid twists, darts away, if it be not brought down by the gun, to disappear in the distance after a desultory flight, have no conception of the bird's behaviour at breeding-time. Then, though flushed quite as suddenly, it will fly round the intruder, at times almost hovering over his head. But, if he have patience, he will see it mount aloft and there execute a series of aerial evolutions of an astounding kind. After wildly circling about, and reaching a height at which it appears a mere speck, where it winnows a random zigzag course, it abruptly shoots downwards and aslant, and then as abruptly stops to regain its former elevation, and this process it repeats many times. A few seconds, more or less according to distance, after each of these headlong descents a mysterious sound strikes his ear—compared by some to drumming and by others to the bleating of a sheep or goat,[1] which sound evidently comes from the bird as it shoots downwards, and then only; but how the sound is made is a question on which many persons are still undecided. There are those who maintain that it proceeds from the throat, while some declare it is produced by the wings, which sharp-sighted observers say they can see in tremulous motion. Others, again, assert that it is caused by the vibration of the webs of the outer rectrices, and these last have in support of their opinion the fact that a similar sound may be made by affixing those feathers to the end of a rod and drawing them rapidly downwards in the same position as they occupy in the bird's tail while it is performing the feat.[2] But, however it be produced, the air will also ring with loud notes that have been syllabled *tinker, tinker, tinker*, while other notes in a different key, something like *djepp, djepp, djepp* rapidly uttered, may be heard as if in response. The nest is always on the ground and is a rather deep hollow wrought in a tuft of herbage, and lined with dry grass leaves. The eggs are four in number, of a dark olive colour, blotched and spotted with rich brown. The young when freshly hatched are beautifully clothed in down of a dark maroon, variegated with black, white, and buff.

The Double or Solitary Snipe of English sportsmen, *S. major*, a larger species, also inhabits northern Europe and may be readily recognized by the white bars in its wings and by its 16 or occasionally 18 rectrices. It has also a very different behaviour. When flushed it rises without alarm-cry, and flies heavily. In the breeding season much of its love-performance is exhibited on the ground, and the sounds to which it gives rise are of another character; but the exact way in which its "drumming" is effected has not been ascertained. Its gesticulations at this time have been well described by Prof. Collett in a communication to Mr Dresser's *Birds of Europe* (vol. vii. pp. 635-637). It visits Great Britain every year at the close of summer, but in very small numbers, and is almost always seen singly—not uncommonly in places where no one could expect to find a Snipe.

The third species of which any details can here be given is the Jack-[3] or Half-Snipe, *S. gallinula*, the smallest and most beautifully coloured of the group. Without being as numerous as the common or full Snipe, it is of frequent occurrence in Great Britain from September to April (and occasionally both earlier and later), but it breeds only, so far as is known, in northern Scandinavia and Russia; and the first trustworthy information on that subject was obtained by Wolley in June 1853, when he found several of its nests near Muonioniska in Lapland.[4] Instead of rising wildly as do most of its allies, it generally lies so close as to let itself be almost trodden upon, and then takes wing silently, to alight at a short distance (if it escape the gun), and to return to the same place on the morrow. In the breeding-season, however, it is as noisy and conspicuous as its larger brethren while executing its aerial evolutions.

As a group the Snipes are in several respects highly specialized, but here there is only space to mention the sensitiveness of the bill, which, though to some extent noticeable in many Sandpipers (see vol. xxi. p. 260), is in Snipes carried to an extreme by a number of filaments, belonging to the fifth pair of nerves, which run almost to the tip, and open immediately under the soft cuticle in a series of cells that give this portion of the surface of the premaxillaries, when exposed, a honeycomb-like appearance. Thus the bill becomes a most delicate organ of sensation, and by its means the bird, while probing for food, is at once able to distinguish the nature of the objects it encounters, though these are wholly out of sight. So far as is known, the sternum of all the Snipes, except the Jack-Snipe, departs from the normal Limicoline formation, a fact which tends to justify the removal of that species to a separate genus, *Limnocryptes*.[5] (A. N.)

[1] Hence in many languages the Snipe is known by names signifying "Flying Goat," "Heaven's Ram," as in Scotland by "Heather-bleater."

[2] Cf. Meves, *Œfvers. K. Vet.-Akad. Forh.*, 1856, pp. 275-277 (transl. *Naumannia*, 1858, pp. 116, 117), and *Proc. Zool. Society*, 1858, p. 202, with Wolley's remarks thereon, *Zool. Garten*, 1876, pp. 201-208.

[3] Though this word is clearly not intended as a nickname, such as is the prefix which custom has applied to the Daw, Pie, Redbreast, Titmouse, or Wren, one can only guess at its origin or meaning. It may be, as in Jackass, an indication of sex, for it is a popular belief that the Jack-Snipe is the male of the common species; or, again, it may refer to the comparatively small size of the bird, as the "jack" in the game of bowls is the smallest of the balls used, and as fishermen call the smaller Pikes Jacks.

[4] His account was published by Hewitson in May 1855 (*Eggs Br. Birds*, 3d ed., ii. pp. 356-358).

[5] The so-called Painted Snipes, forming the genus *Rhynchæa*, demand a few words. Four species have been described, natives respectively of South America, Africa, India with China, and Australia. In all of these it appears that the female is larger and more brilliantly coloured than the male, and in the Australian species she is further distinguished by what in most birds is emphatically a masculine property, though its use is here unknown,—namely, a complex trachea, while the male has that organ simple. He is also believed to undertake the duty of incubation.

SNORRO STURLUSON (Snorri, son of Sturla) (1179-1241), the celebrated Icelandic historian, born in 1179, the youngest son of a chief in the Vestfirðir (western fiords), was brought up by a powerful chief, Jon Loptsson, in Odda, who seems first to have awakened in him an interest for history and poetry His career begins with his marriage, which made him a wealthy man, in 1206 he settled at Reykjaholt, where he constructed magnificent buildings and a bath of hewn stones, preserved to the present day, to which water was conducted from a neighbouring hot spring He early made himself known as a poet, especially by glorifying the exploits of the contemporary Norse kings and earls, at the same time he was a learned lawyer, and from 1215 became the "logsogumaðr," or president of the legislative assembly and supreme court of Iceland The prominent features of his character seem to have been cunning, ambition, and avarice, combined with want of courage and aversion to effort By royal invitation he went in 1218 to Norway, where he remained a long time with the young king Hakon and his tutor Earl Skuli When, owing to disputes between Icelandic and Norwegian merchants, Skuli thought of a military expedition to Iceland, Snorro persuaded him to give up this plan, promising to make the inhabitants submit to Hakon of their own free will Snorro himself became the "lendrmaðr," vassal or baron, of the king of Norway, and held his lands as a fief under him On his return home Snorro sent his son to the king as a hostage, and made peace between Norway and Iceland, but his power and influence were used more for his own enrichment and aggrandizement—he was "logsogumaðr" again from 1222 to 1232—than for the advantage of the king Hakon, therefore, stirred up strife between Snorro's kinsman Sturla and Snorro, who had to fly from Reykjaholt in 1236, and in 1237 he left the country and went back to Norway Here he joined the party of Skuli, who was meditating a revolt Learning that his cousin Sturla in Iceland had fallen in battle against Gissur, Snorro's son-in-law, Snorro, although expressly forbidden by his liege lord, returned to Iceland in 1239 and once more took possession of his property Meanwhile Hakon, who had vanquished Skuli in 1240, sent orders to Gissur to punish Snorro for his disobedience either by capturing him and sending him back to Norway or by putting him to death Gissur took the latter course, attacked Snorro at his residence, Reykjaholt, and slew him on 22d September 1241

Snorro is the author of the *Edda* and of the *Sagas of the Norwegian Kings* The *Edda*, now called the Prose Edda, to distinguish it from the Poetic or Sæmund's Edda, was finished in 1222, and consists of three parts (1) The *Gylfaginning*, or the Delusion of Gylfi, with a short preface, gives a summary of the ancient Norse mythology, founded on the *Voluspa* and other mythical poems, the author gives a euhemeristic account of the ancient gods, regarding them as chiefs versed in witchcraft who had immigrated to the north and there introduced their special religion (2) The *Skaldskaparmal*, or Art of Poetry, gives, under the form of a dialogue between the god Bragi and the giant (jotun) Ægir, an explanation of all figurative mythological expressions of the ancient poetry, and the rules for using them (3) The *Hattatal*, or Enumeration of Metres, is a running commentary on three poems composed by Snorro in 1222 in honour of Hakon and Skuli, the stanzas of which, numbering about a hundred, are each in a different metre In the MSS the *Edda* has received many additions, which are wrongly ascribed to Snorro For different editions see EDDA The *Sagas of the Norwegian Kings* gives a connected series of biographies of the kings of Norway down to Sverri in 1177, here the author stops, because the history of Sverri and his successors had already been written The work opens with the *Ynglinga Saga*, a brief history of the pretended immigration into Sweden of the Æsir, of their successors in that country, the kings of Upsala, and of the oldest Norwegian kings, their descendants Next come the biographies of the succeeding Norwegian kings, the most detailed being those of the two missionary kings Olaf Tryggvason and St Olaf Snorro's sources were partly succinct histories of the realm, as the chronological sketch of Ari, partly more voluminous early collections of traditions, as the *Noregs Konungatal* (*Fagrskinna*) and the *Jarlasaga*, partly legendary biographies of the two Olafs, and, in addition to these, studies and collections which he himself made during his journeys in Norway All these he worked up with great independence and critical sagacity into an harmonious whole His critical principles are explained in the preface, where he dwells on the necessity of starting as much as possible from trustworthy contemporary sources, or at least from those nearest to antiquity,—the touchstone by which verbal traditions can be tested being contemporary poems He inclines to rationalism, rejecting the marvellous and recasting legends containing it in a more historical spirit, but he makes an exception in the accounts of the introduction of Christianity into Norway and of the national saint St Olaf Snorro's style is peculiar to himself He strives everywhere to impart life and vigour to his narrative, to express the sentiments and feelings of the actors, and he gives the dialogues in the individual character of each person Especially in this last he shows a tendency to epigram and often uses humorous and pathetic expressions Besides his principal work, he elaborated in a separate form its better and larger part, the *History of St Olaf* (the great *Olaf's Saga*) In the preface to this he gives a brief extract of the earlier history, and, as an appendix, a short account of St Olaf's miracles after his death, here too he employs critical art, as appears from a comparison with his source, the Latin legend

The *Sagas of the Norwegian Kings* has been preserved in several MSS of the 13th century, the oldest of these, no longer extant, had lost at an early period its first leaf containing the preface, and thus came to begin with the words, *Kringla heimsins* (= orbis terrarum), which caused first this MS and later (about 1700) the whole work to be called the *Heimskringla* Editions —by Peringskiold, 3 vols fol, Stockholm, 1697, by Gerhard Schoning and Skule Thorlacius, 3 vols fol, Copenhagen, 1777 1783, by C R Unger, 1 vol 8vo, Christiania, 1868 Modern translations —into Danish, by N F S Grundtvig, 1818 22, Norwegian, by Jacob Aall, 1833 39, and by P A. Munch, 1859, Swedish, by Richert, 1816 29, and by H Hildebrand, 1869 71, German, by Wachter, 1835 36, English, by Laing, 1844 (G S †)

SNOW See METEOROLOGY, vol xvi p 154, also GEOLOGY, vol x pp 280-281

SNOWDROP, *Galanthus nivalis*, is the best-known representative of a small genus of Amaryllids, all the species of which have bulbs, linear leaves, erect flower-stalks, destitute of leaves but bearing at the top a solitary pendulous bell-shaped flower The white perianth is six-parted, the outer three segments being larger and more convex than the inner series The six anthers open by pores or short slits The ovary is three-celled, ripening into a three-celled capsule The snowdrop is a doubtful native of Great Britain, but is largely cultivated for market in Lincolnshire There are numerous varieties, differing in the size of the flower and the period of flowering The double form is probably the least attractive Other distinct species of snowdrop, not to be confounded with the varieties before mentioned, are the Crimean snowdrop, *G plicatus*, with broad leaves folded like a fan, and *G Elwesii*, a native of the Levant, with large flowers, the three inner segments of which have a much larger and more conspicuous green blotch than the commoner kinds All the species are very graceful, and as universal favourites amply repay cultivation

SNOW-SHOES are a kind of foot gear used by Indians and trappers in Canada for travelling over the frozen surface of snow In the long North-American winters they are the sole means of locomotion when railways and roads are snowed up, as the frozen surface of snow is not sufficiently consistent to support the weight of the human body without artificial aid The snow-shoer protects his feet by wearing moccasins of moose-skin The framework of a snow-shoe consists of a long narrow piece of pliable hickory wood, placed edgeways and then bent round with an oval-shaped front, and is adorned on the sides with tufts of crimson wool The ends taper gradually to the rear, where they are fastened firmly to each other The total length is about 39 inches and the width from 13 to 16 inches Across the oval, and fitted into the inside of the framework by mortices, are two battens of wood, 5 or 6 inches clear of both ends Over the front one at an open space a deerskin thong is fastened, forming an aperture for the reception of the great toe The thong is then crossed over the top of the foot, passed round and tied to the sides This leaves the heel free to move up and down on the shoe and rests the weight of it on the toes Over the remainder of the oval

is stretched a network of tightly drawn strips of leather. At a convention held in Montreal on 30th December 1871 a rule was passed that a "pair of racing shoes, including strings, shall not weigh less than 1½ lb nor measure less than 10 inches of gut in width." The motion of a snow-shoer in the distance is curious and resembles that of some ungainly web-footed animal. On using the implements the knees must be turned inwards and the fore part of the feet outwards to avoid wounding the ankles with the frameworks. At first the fatigue and consequent stiffness are great, but with practice this wears off and the motions become easy. The speed attained as compared to that in skating is not quick. The following are the best recorded times in Montreal, Canada, with shoes of regulation size and weight:—100 yards, 12 sec.; 220 yards, 26 sec.; ¼ mile, 1 min. 7¾ sec.; ½ mile, 2 min. 33 sec.; ¾ mile, 4 min. 21 sec.; 1 mile, 5 min. 42½ sec.; 2 miles, 11 min. 52¾ sec.; 3 miles, 20 min. 18 sec.; 4 miles, 27 min. 10 sec.; 4½ miles, 30 min. 36 sec.; 5 miles, 33 min. 49½ sec. The best history of the pastime and its records is *Montreal Snow-shoe Club*, sm. 8vo, Montreal, 1882.

SNUFF. See TOBACCO.

SNYDERS, FRANZ (1579-1657), painter of animals and still life, was born at Antwerp in 1579. In 1593 he was studying under Peter Breughel, and afterwards he received instruction from Henry van Balen, the first master of Vandyke. He devoted himself to painting flowers, fruit, and subjects of still life, but afterwards turned to animal-painting, and executed with the greatest skill and spirit hunting pieces and combats of wild animals. His composition is rich and varied, his drawing correct and vigorous, his touch bold and thoroughly expressive of the different textures of the furs and skins of the animals represented. His excellence in this department excited the admiration of Rubens, who frequently employed him to paint animals, fruit, and still life in his own pictures, and he assisted Jordaens in a similar manner. In the lion and boar hunts which bear the name of Snyders the hand of Rubens sometimes appears. He was appointed principal painter to the archduke Albert, governor of the Low Countries, for whom he executed some of his finest works. One of these, a Stag-Hunt, was presented to Philip III., who commissioned the artist to paint several subjects of the chase, which are still preserved in Spain. Snyders died at Antwerp in 1657.

SOAP may in general terms be defined as a chemical compound resulting from the union of fatty oils and fats with alkaline bodies. In a scientific definition the compounds of fatty acids with basic metallic oxides, lime, magnesia, lead oxide, &c., should also be included under soap; but, as these compounds are insoluble in water, while the very essence of a soap in its industrial relations is solubility, it is better to speak of the insoluble compounds as "plasters," limiting the name "soap" to the compounds of fatty acids with soda and potash. Soap both as a medicinal and as a cleansing agent was known to Pliny (*H. N.*, xxviii. 51), who speaks of two kinds—hard and soft—as used by the Germans. He mentions it as originally a Gallic invention for giving a bright hue to the hair ("rutilandis capillis"). There is reason to believe that soap came to the Romans from Germany, and that the detergents in use in earlier times and mentioned as soap in the Old Testament (Jer. ii. 22; Mal. iii. 2, &c.) refer to the ashes of plants and other such purifying agents (comp. vol. x. p. 697).

Till Chevreul's classical researches on fatty bodies (1811-23) it was believed that soap consisted simply of a binary compound of fat and alkali. Claude J. Geoffroy in 1741 pointed out that the fat or oil recovered from a soap solution by neutralization with a mineral acid differs from the original fatty substance by dissolving readily in alcohol, which is not the case with ordinary fats and oils. The significance of this observation was overlooked; and equally unheeded was a not less important discovery by Scheele in 1783. In preparing lead plaster by boiling olive oil with oxide of lead and a little water—a process palpably analogous to that of the soap-boiler—he obtained a sweet substance which, called by himself "Oelsüss" ("principium dulce oleorum"), is now known as "glycerin." These discoveries of Geoffroy and Scheele formed the basis of Chevreul's researches by which he laid bare the constitution of oils and the true nature of soap. (See OILS, vol. xvii. p. 740, and GLYCERIN, vol. x. p. 697.) In those articles it is pointed out that all fatty oils and fats are mixtures of glycerides, that is, of bodies related to the alcohol glycerin $C_3H_5(OH)_3$, and some fatty acid such as palmitic acid $(C_{16}H_{31}O_2)H$. Under suitable conditions

$$\underset{\text{Glycerin}}{C_3H_5(OH)_3} + \underset{\text{Palmitic Acid}}{3(C_{16}H_{31}O_2)H} \text{ give } \underset{\text{Palmitin}}{C_3H_5(C_{16}H_{31}O_2)_3} + \underset{\text{Water}}{3H_2O}$$

The corresponding decomposition of palmitin into palmitic acid and glycerin takes place when the glyceride is distilled in superheated steam, and similarly it can be realized by boiling in water mixed with a suitable proportion of caustic potash or soda. But in this case the fatty acid unites with the alkali into its potash or soda salt, forming a soap—

$$\underset{\text{Palmitin}}{C_3H_5(C_{16}H_{31}O_2)_3} + \underset{\text{Soda Hydrate}}{3NaOH} = \underset{\text{Soap}}{3NaC_{16}H_{31}O_2} + \underset{\text{Glycerin}}{C_3H_5(OH)_3}$$

Of the natural fats or glycerides contained in oils the most important in addition to palmitin are stearin and olein, and these it may be sufficient to regard as the principal fatty bodies concerned in soap-making.

The general characters of a soap are a certain greasiness to the touch, ready solubility in water, with formation of viscid solutions which on agitation yield a tenacious froth or "lather," an indisposition to crystallize, readiness to amalgamate with small proportions of hot water into homogeneous slimes, which on cooling set into jellies or more or less consistent pastes. Soaps give an alkaline reaction and have a decided acrid taste; in a pure condition—a state never reached in practice—they have neither smell nor colour. Almost without exception potash soaps even if made from the solid fatty acids are "soft," and soda soaps, although made with fluid olein, are "hard", but there are considerable variations according to the prevailing fatty acid in the compound. Almost all soda soaps are precipitated from their watery solutions by the addition of a sufficiency of common salt. Potash soap with the same reagent undergoes double decomposition—a proportion being changed into a soda soap with the formation of chloride of potassium. Soap when dissolved in a large amount of water suffers hydrolysis, with formation of a precipitate of alkaliferous fatty acid and a solution containing free alkali. Its cleansing power is ordinarily explained by this reaction; but it is difficult to see why a solution which has just thrown off most of its fatty acids should be disposed to take up even a glyceride. It is more likely that the cleansing power of soap is due to the inherent property of its solution to emulsionize fats.

Resin soaps are compounds of soda or potash with the complex acids (chiefly abietic) of which coniferous resins consist. Their formation is not due to a true process of saponification; but they occupy an important place in compound soaps.

MANUFACTURE.—The varieties of soaps made are numerous; the purposes to which they are applied are varied; the materials employed embrace a considerable range of oils, fats, and other bodies; and the processes adopted undergo many modifications. As regards processes of manufacture soaps may be made by the direct combination of fatty acids, separated from oils, with alkaline solutions. In the manufacture of stearin for candles, &c., the fatty matter is decomposed, and the liquid olein, separated from the solid fatty acids, is employed as an ingredient in soap making. A soap so made is

not the result of saponification but of a simple combination, as is the case also with resin soaps All other soaps result from the combination of fatty oils and fats with potash or soda solutions under conditions which favour saponification The soap solution which results from the combination forms soap size and is a mixture of soap with water, the excess alkali, and the glycerin liberated from the oil In such condition ordinary soft soaps and certain kinds of hard soap are brought to the market In curd soaps, however, which form the basis of most household soap, the uncombined alkali and the glycerin are separated by "salting out," and the soap in this condition contains about 30 per cent of water Soap may be framed and finished in this state, but almost invariably it receives a further treatment called "refining" or "fitting," in which by remelting with water, with or without the subsequent addition of other agents to harden the finished product, the soap may be made to contain from 60 to 70 per cent of water and yet present a firm hard texture

Among the raw materials used by the soap-boiler the principal fatty bodies are tallow, lard, palm oil, palm-kernel oil, olive oil, cotton-seed oil, sesame oil, and cocoa-nut oil for hard soaps, and fish oils, linseed oil, marrow fat, and the lower qualities of other oils obtained by extraction, &c , for potash or soft soaps Almond oil, spermaceti, cocoa-butter, ground-nut oil, and some others form the basis of certain toilet and medicinal soaps Resin and colophony form essential ingredients in yellow soaps The alkalis are used almost exclusively in the condition of caustic lyes,—solutions of their respective hydrates in water Caustic soda is now obtained direct from the soda manufacturer, and one operation, causticizing the soda, is thus spared the soap-boiler Potash lyes are, however, principally sharpened or causticized by the soap-boiler himself from potash carbonate, the process for which is described under POTASSIUM METALS (vol xix p 589)

The process of soap boiling is carried out in large iron boilers called "soap pans" or "coppers," some of which have capacity for a charge of 30 tons or more The pan proper is surmounted by a great cone or hopper called a curb, to provide for the foaming up of the boiling mass and to prevent loss from overflowing Formerly the pans were heated by open firing from below, but now the almost universal practice is to boil by steam injected from perforated pipes coiled within the pan, such injection favouring the uniform heating of the mass and causing an agitation favourable to the ultimate mixture and saponification of the materials Direct firing is used for the second boiling of the soap mixture, but for this superheated steam may with advantage be substituted, either applied by a steam-jacket round the pan or by a closed coil of pipe within it In large pans a mechanical stirring apparatus is provided, which in some cases, as in Morfit's steam "twirl," is formed of the steam-heating tubes geared to rotate Closed cylinders in which the materials are boiled under pressure are also employed for certain soaps

Curd Soap —The oil mixture used differs in the several manufacturing countries, and the commercial name of the product is correspondingly varied In Germany tallow is the principal fat, in France olive oil occupies the chief place and the product is known as Marseilles or Castile soap, and in England tallow and palm oil are largely used But in all countries a mixture of several oils enters into the composition of curd soaps and the proportions used have no fixity For each ton of soap to be made from 12 to 16 cwts of oil is required The soap pan is charged with the tallow or other fat, and open steam is turned on So soon as the tallow is melted a quantity of weak lye is added, and the agitation of the injected steam causes the fat and lye to become intimately mixed and produces a milky emulsion As the lye becomes absorbed, a condition indicated by the taste of the goods, additional quantities of lye of increasing strength are added After some time, the contents of the pan begin to clear and become in the end very transparent Lye still continues to be poured in till a sample tastes distinctly alkaline,—a test which indicates that the whole of the fatty acids have been taken up by and combined with the alkali Then without further addition of alkali the boiling is continued for a few minutes, when the soap is ready for salting out or "graining" Either common salt or strong brine in measured quantity is added to the charge, and, the soap being insoluble in such salt solution, a separation of constituents takes place the soap collects on the surface in an open granular condition, and the spent lye sinks to the bottom after it has been left for a short time to settle Supposing now that a pure soap without resin is to be made—a product little seen in the market—the spent lye is run off, steam is again turned on, pure water or very weak lye run in, and the contents boiled up till the whole is thin, close, and clear The soap is from this again grained off or salted out, and the underlye so thrown down carries with it coloured impurities which may have been in the materials or which arise from contact with the boiler Such washing process may have to be repeated several times when impure materials have been used The spent lye of the washing being drained off, the soap now receives its strengthening boil Steam is turned on, and, the mass being brought to a clear condition with weak lye or water, strong lye is added and the boiling continued with close steam till the lye attains such a state of concentration that the soap is no longer soluble in it, and it will separate from the caustic lye as from a common salt solution The contents of the pan are once more allowed to cool and settle, and the soap as now formed constitutes a pure curd soap, carrying with it some proportion of uncombined alkali, but containing the minimum amount of water It may be skimmed off the underlye and placed direct in the frames for solidification, but that is a practice scarcely at all followed, the addition of resin soap in the pan and the subsequent "crutching in" of silicate of soda and adulterant mixings being features common to the manufacture The lye from the strengthening boil contains much alkali and is used in connexion with other boilings

Mottled Soap —A pure curd soap always carries with it into the cooling frame a considerable amount of coloured impurity, such as iron sulphate, &c When it is permitted to cool rapidly the colouring matter remains uniformly disseminated throughout the mass, but when means are taken to cause the soap to cool and solidify slowly a segregation takes place the stearate and palmitate form a semi-crystalline solid, while the oleate, solidifying more slowly, comes by itself into translucent veins, in which the greater part of the coloured matter is drawn In this way mottled or marbled soap is formed, and such mottled appearance was formerly highly valued as an indication of freedom from excess of water or other adulteration, because in fitted soaps the impurities are either washed out or fall to the bottom of the mass in cooling Now, however, the most perfect mottle can be produced by working colouring matter into the soap in the frame, and mottling is very far from being a certificate of excellence of quality

Yellow Soap consists of a mixture of any hard fatty soap with a variable proportion—up to 40 per cent or more—of resin soap That substance by itself has a tenacious gluey consistence, and its intermixture in excess renders the resulting compound soft and greasy The ordinary method of adding resin consists in stirring it in small fragments into the fatty soap in the stage of clear-boiling, but a better result is obtained by separately preparing a fatty soap and the resin soap, and combining the two in the pan after the underlye has been salted out and removed from the fatty soap The compound then receives its strengthening boil, after which it is fitted by boiling with added water or weak lye, continuing the boil till by examination of a sample the proper consistency has been reached On settling a dark-coloured "nigger" or underlye separates out, which, because it contains some soap and alkali, is saved for future use

Marine Soap —Cocoa-nut oil behaves as regards saponification quite differently from all other oils and fats in relation to the caustic alkalis It does not form an emulsion with weak alkalis, these even under prolonged boiling have no influence on the fat With strong alkaline solutions, on the other hand, it saponifies with the utmost readiness even without heat, and forms without the separation of any underlye a soap of stiff firm consistence notwithstanding the presence of a very large percentage of water Such soap is not insoluble in a strong solution of salt, hence it forms a lather and can be used for washing with sea-water, from which peculiarity it derives its name "marine soap" Being thus soluble in salt water it cannot of course be salted out like common soaps, but if a very concentrated salt solution is used precipitation is effected, and a curd soap is separated so hard and refractory as to be practically useless Cocoa-nut soap is usually prepared by the so-called cold method, in which the fat heated to 80° C is treated with a calculated quantity of caustic soda solution of sp gr 1 350, the two constituents being stirred together till the setting and hardening of the combination prevents further agitation The property that cocoa-nut soap possesses of absorbing large proportions of water, and yet presenting the appearance of a hard solid body, makes the material a favourite basis for highly sophisticated compounds, in which water, sulphate of soda, and other alkaline solutions, soluble silicates, fuller's earth, starch, &c , play an important and bulky part Cocoa-nut soap is little prepared by itself, but it forms a principal ingredient in compound soaps meant to imitate curd and yellow soaps Two principal methods of preparing such compound soaps are employed. In the first way the ordinary oil and the cocoa nut oil are mixed and saponified together with such a measured quantity of alkaline solution as serves to produce a hard soap without any salting out or separation of underlye According to the second plan, the ordinary oil is treated as for the preparation of a curd soap, and to this the cocoa-nut soap separately saponified is added in the pan and both are boiled together till they form a homogeneous soap

Silicate Soaps —A further means of enabling a soap to contain large proportions of water and yet present a firm consistence is found in the use of silicate of soda The silicate in the form of a concentrated solution is crutched or stirred into the soap in a mechanical mixing machine after the completion of the saponification, and it appears to enter into a distinct chemical combination with the soap While silicate soaps bear heavy watering, the

soluble silicate itself is a powerful detergent, and it possesses certain advantages when used with hard waters, so that, taking its cheapness into account, the question whether its introduction into soap is a fraud may be fairly discussed and much said in its defence.

Framing.—The frames into which hard soaps are ladled for cooling and solidification consist of rectangular boxes made of iron plates and bound and clamped together in a way that allows the sides to be removed when required. The solidification is a very gradual process, depending, of course, for its completion on the size of the block; but before cutting into bars it is essential that the whole should be set and hardened through and through, else the cut bars would not hold together. Many ingenious devices for forming bars have been produced; but generally a strong frame is used, across which steel wires are stretched at distances equal to the size of the bars to be made, the blocks being first cut into slabs and then into bars.

Soft Soap.—As already said, soft soaps are made with potash lyes, although in practice a small quantity of soda is also used to give the soap some consistence. There is no separation of underlyes in potash soap, consequently the product contains the whole constituents of the oils used, as the operation of salting out is quite impracticable owing to the double decomposition which results from the action of salt, producing thereby a hard principally soda soap with formation of chloride of potassium. Owing to this circumstance it is impossible to "fit" or in any way purify soft soap, and all impurities which go into the pan of necessity enter into the finished product. The making of soft soap, although thus a much less complex process than hard soap making, is one that demands much skill and experience for its success. From the conditions of the manufacture care must be taken to regulate the amount and strength of the alkali in proportion to the oil used, and the degree of concentration to which the boiling ought to be continued has to be determined with close observation.

Toilet Soaps, &c.—Soaps used in personal ablution in no way differ from the soaps previously alluded to, and may consist of any of the varieties. It is of consequence that they should, as far as possible, be free from excess of alkali and all other salts and foreign ingredients which may have an injurious effect on the skin. The manufacturer of toilet soap generally takes care to present his wares in convenient form and of agreeable appearance and smell; the more weighty duty of having them free from uncombined alkali is in many cases entirely overlooked. Transparent soaps are prepared by dissolving ordinary soap in strong alcohol and distilling off the greater portion of the alcohol till the residue comes to the condition of a thick transparent jelly. This, when cast into forms and allowed to harden and dry slowly, comes out as transparent soap. A class of transparent soap may also be made by the cold process, with the use of cocoa-nut oil, castor oil, and sugar. It generally contains a large amount of uncombined alkali, and that, with its unpleasant odour of cocoa-nut oil, makes it a most undesirable soap for personal use. Toilet soaps of common quality are perfumed by simple melting and stirring into the mass some cheap odorous body that is not affected by alkalis under the influence of heat. The finer soaps are perfumed by the cold method; the soap is shaved down to thin slices, and the essential oil kneaded into and mixed with it by special machinery, after which it is formed into cakes by pressure in suitable moulds.

Glycerin soap ordinarily consists of about equal parts of pure hard soap and glycerin (the latter valuable for its emollient properties). The soap is melted by heat, the glycerin is stirred in, and the mixture strained and poured into forms, in which it hardens but slowly into a transparent mass. With excess of glycerin a fluid soap is formed, soap being soluble in that body, and such fluid soap has only feeble lathering properties. Soap containing small proportions of glycerin, on the other hand, forms a very tenacious lather, and when soap bubbles of an enduring character are desired glycerin is added to the solution. Soaps are also prepared in which large proportions of fine sharp sand, or of powdered pumice, are incorporated, and these substances, by their abrading action, powerfully assist the detergent influence of the soap on hands much begrimed by manufacturing operations.[1]

Medicated soaps contain certain substances which exercise a specific influence on the skin. A few medicated soaps are prepared for internal use, among which are croton soap and jalap soap, both gentler cathartics than the uncompounded medicinal principles. Medicated soaps for external use are only employed in cases of skin ailments and as prophylactic washes. Among the principal varieties are those which contain carbolic acid, petroleum, borax, camphor, chlorine, iodine, mercurial salts, sulphur, and tannin. Arsenical soap is very much employed by taxidermists for the preservation of the skins of birds and mammals. It consists of a mixture of white arsenic, hard soap, and slaked lime, say 4 oz. of each, with 12 oz. of carbonate of potash, the whole being made into a stiff paste with water.

The following table indicates the average composition of several commercial soaps:—

	Water	Fatty Acid	Soda: Combined	Soda: Free	Potash	Soluble Silica	Glycerin	Other Salts	Loss
Tallow soap	28.8	58.0	6.8	1.6				2.3	2.5
Marseilles soap, mottled	10.15	76.0	8.65	0.25				4.95	
Palm oil soap	35.4	49.9	7.0	1.0				1.1	5.6
Yellow soap	22.23	62.95[2]	8.03					6.79	
Cocoa nut oil soap	58.74	32.82	4.26	1.50				2.26	0.42
Silicate soap	50.4	5.5	10.7			33.4			
Soft soap	43.3	41.9			10.2		4.6		

Soap Analysis.—Here it will be sufficient to mention a few tests which can be executed without special chemical knowledge. To determine the water in a soap—a most important question—a few thin slices are weighed and dried in a stove at 105° C. so long as loss of weight continues. The loss of weight is the measure of uncombined water in the sample. Added salts, such as alkaline silicates, sulphates, &c. and insoluble earthy admixtures are detected by boiling a sample with alcohol, in which only the soap proper dissolves. The residue is collected in a filter, washed with hot alcohol, and weighed. An excessive proportion of surplus alkali can be detected by dissolving the soap in hot water and adding a sufficiency of saturated solution of common salt to salt it out. The alkali remains in solution and can be determined by the amount of a standard acid solution it neutralizes.

Commerce.—Marseilles has long been recognized as the most important centre of the soap trade, a position that city originally achieved through its ready command of the supplies of olive oil. The city is still very favourably situated for obtaining supplies of oils both local and foreign, including sesame, ground nut, castor oil, &c. In England the soap trade did not exist till the 16th century. In the reign of Charles I. a monopoly of soap-making was farmed to a corporation of soap-boilers in London,—a proceeding which led to serious complications. From 1712 to 1853 an excise duty ranging from 1d. to 3d. was levied on soap made in the United Kingdom, and that heavy impost (equal when 3d. to more than 100 per cent.) greatly impeded the development of the industry. In 1793, when the excise duty was 2½d. on hard and 1¾d. on soft soap, the revenue yielded was a little over £400,000; in 1815 it was almost £750,000; in 1835, when the duty was levied at 1½d. and 1d. respectively (and when a drawback was allowed for soap used in manufactures), the revenue was almost £1,000,000; and in 1852, the last year in which the duty was levied, it amounted to £1,126,046, with a drawback on exportation amounting to £271,000. What the manufacture has risen to since that time there is no accurate way of estimating. (W. D.—J. PA.)

SOAP BARK. A vegetable principle known as "saponin," and chemically analogous to the arabin of soluble gums and to mucilage, forms with water a lather, and is on that account available as a substitute for soap. Saponin is obtainable from soap nuts, the fruit of a tree, *Saponaria officinalis* and allied species; but its most important source is the Quillai bark of Chili yielded by a large tree, *Quillaja saponaria*. The inner bark of the tree, reduced to powder, is employed in Chili as a substitute for soap.

SOBIESKI, JOHN, king of Poland. See JOHN III., vol. xiii. p. 714, and POLAND, vol. xix. p. 295.

SOCAGE is a form of tenure. Bracton, Britton, and other old writers derived the word from the French *soc*, "a ploughshare." Modern etymologists, however, prefer to derive it from the Old English *soc*, "a franchise" or "privilege," or the land over which such franchise or privilege was exercised. Socage differs from knight service in being agricultural rather than military in its nature, and from frankalmoign in being based on temporal rather than spiritual services. It is either free or villein. Free socage *in capite* was abolished by 12 Car. II. c. 24. That form of free socage called common socage is the ordinary modern freehold tenure. Varieties of it are burgage, gavelkind, and petit serjeanty. Scutage, while it existed, was another variety. The only representative of villein socage is the comparatively rare tenure of ancient demesne confined to manors, described in Domesday Book as *terræ regis*. Socage tenure is said to have formerly existed in Scotland. The descent of socage lands in Scotland seems to have been to all the sons equally, as was originally the case in England. (See BURGAGE, GAVELKIND, REAL ESTATE, SCUTAGE.)

[1] "Soap powders" and "soap extracts" are simply preparations of alkalis.

[2] Including resin acids.

SOCIALISM[1]

Origin of name

THE word "socialism" is of comparatively recent origin, having been coined in England in 1835. In that year a society which received the grandiloquent name of the "Association of all Classes of all Nations" was founded under the auspices of Robert Owen, and the words "socialist" and "socialism" were first used during the discussions which arose in connexion with it. As Owen and his school had no esteem for the political reform of the time, and laid all emphasis on the necessity of social improvement and reconstruction, it is obvious how the name came to be recognized as suitable and distinctive. The term was borrowed from England by a distinguished French writer, Reybaud, in his well-known work the *Réformateurs modernes* (1839), in which he discussed the theories of Saint-Simon, Fourier, and Owen. Through Reybaud it soon gained wide currency on the Continent, and is now the accepted world-historic name for one of the most remarkable movements of the 19th century.

The name was thus first applied in England to Owen's theory of social reconstruction, and in France to those also of Saint-Simon and Fourier. The best usage has always connected it with the views of these men and the cognate opinions which have since appeared. The word, however, is used with a great variety of meaning not only in popular speech and by politicians but even by economists and learned critics of socialism. The general tendency is to regard as socialistic any interference with property undertaken by society on behalf of the poor, the limitation of the principle of *laissez-faire* in favour of the suffering classes, radical social reform which disturbs the present system of private property as regulated by free competition.

Vague usage of current speech

It is probable enough that the word will be permanently used to express the tendency indicated in these phrases, as a general name for the strong reaction that has now set in against the overstrained individualism and one-sided freedom which date from the latter half of the 18th century. The application is neither precise nor accurate, but it is use and wont that determine the meaning of words, and this seems to be the tendency of use and wont.

Definitions of leading writers

Even economic writers differ greatly in the meaning they attach to the word. The great German economist Roscher defines it as including "those tendencies which demand a greater regard for the common weal than consists with human nature." Adolf Held says that "we may define as socialistic every tendency which demands the subordination of the individual will to the community." Janet more precisely defines it as follows:—"We call socialism every doctrine which teaches that the state has a right to correct the inequality of wealth which exists among men and to legally establish the balance by taking from those who have too much in order to give to those who have not enough, and that in a permanent manner, and not in such and such a particular case,—a famine, for instance, a public calamity, &c." Laveleye explains it thus: "In the first place every socialistic doctrine aims at introducing greater equality in social conditions, and in the second place at realizing those reforms by the law or the state." Von Scheel simply defines it as the "economic philosophy of the suffering classes." Of all these definitions it can only be said that they more or less faithfully reflect current opinion as to the nature of socialism. They are either too vague or they are misleading, and they quite fail to bring out the clear and strongly marked characteristics that distinguish the phenomena to which the name of socialism is properly applied. To say that socialism exacts a greater regard for the common weal than is compatible with human nature is to pass sentence on the movement, not to define it. In all ages of the world, and under all forms and tendencies of government and of social evolution, the will of the individual has been subordinated to the will of society, often unduly so. It is also most misleading to speak as if socialism must proceed from the state as we know it. The early socialism proceeded from private effort and experiment. A great deal of the most notorious socialism of the present day aims not only at subverting the existing state in every form but all the existing political and social institutions. The most powerful and most philosophic, that of Karl Marx, aimed at superseding the existing governments by a vast international combination of the workers of all nations, without distinction of creed, colour, or nationality.

Socialism not essentially violent and lawless

Still more objectionable, however, is the tendency not unfrequently shown to identify socialism with a violent and lawless revolutionary spirit. As sometimes used, "socialism" means nothing more nor less than the most modern form of the revolutionary spirit with a suggestion of anarchy and dynamite. This is to confound the essence of the movement with an accidental feature more or less common to all great innovations. Every new thing of any moment, whether good or evil, has its revolutionary stage in which it disturbs and upsets the accepted beliefs and institutions. The Protestant Reformation was for more than a century and a half the occasion of national and international trouble and bloodshed. The suppression of American slavery could not be effected without a tremendous civil war. There was a time when the opinions comprehended under the name of "liberalism" had to fight to the death for toleration, and representative government was at one time a revolutionary innovation. The fact that a movement is revolutionary generally implies only that it is new, that it is disposed to exert itself by strong methods, and is calculated to make great changes. It is an unhappy feature of most great changes that they have been attended with the exercise of force, but that is because the powers in possession have generally attempted to suppress them by the exercise of force.

In point of fact socialism is one of the most elastic and protean phenomena of history, varying according to the time and circumstances in which it appears and with the character and opinions and institutions of the people who adopt it. Such a movement cannot be condemned or approved *en bloc*. Most of the current formulæ to which it has been referred for praise or censure are totally erroneous and misleading. Yet in the midst of the various theories that go by the name of "socialism" there is a kernel of principle that is common to them all. That principle is of an economic nature, and is most clear and precise.

Its central principle economic

The central aim of socialism is to terminate the divorce of the workers from the natural sources of subsistence and of culture. The socialist theory is based on the historical assertion that the course of social evolution for centuries has gradually been to exclude the producing classes from the possession of land and capital and to establish a new subjection, the subjection of workers, who have nothing to depend on but precarious wage-labour. The socialists maintain that the present system (in which land and capital are the property of private individuals freely struggling for increase of wealth) leads inevitably to social and

[1] The aim of the present article is essentially to give a history and exposition of socialism in its leading phases and principles. The point of view is objective,—to explain what socialism has been and is. A controversial or critical article on the many vexed questions suggested by the subject would have been inconsistent with the plan of this work.

economic anarchy, to the degradation of the working man and his family, to the growth of vice and idleness among the wealthy classes and their dependants, to bad and inartistic workmanship, and to adulteration in all its forms, and that it is tending more and more to separate society into two classes,—wealthy millionaires confronted with an enormous mass of proletarians,—the issue out of which must either be socialism or social ruin. To avoid all these evils and to secure a more equitable distribution of the means and appliances of happiness, the socialists propose that land and capital, which are the requisites of labour and the sources of all wealth and culture, should become the property of society, and be managed by it for the general good. In thus maintaining that society should assume the management of industry and secure an equitable distribution of its fruits socialists are agreed, but in the most important points of detail they differ very greatly.

Points of difference amongst socialists.

They differ as to the form society will take in carrying out the socialist programme, as to the relation of local bodies to the central government, and whether there is to be any central government, or any government at all in the ordinary sense of the word, as to the influence of the national idea in the society of the future, &c. They differ also as to what should be regarded as an "equitable" system of distribution. The school of Saint-Simon advocated a social hierarchy in which every man should be placed according to his capacity and rewarded according to his works. In the communities of Fourier the minimum of subsistence was to be guaranteed to each out of the common gain, the remainder to be divided between labour, capital, and talent,—five-twelfths going to the first, four-twelfths to the second, and three-twelfths to the third. At the revolution of 1848 Louis Blanc proposed that remuneration should be equal for all members of his *social workshops*. In the programme drawn up by the united social democrats of Germany (Gotha, 1875) it is provided that all shall enjoy the results of labour "according to their reasonable wants," all of course being bound to work. It is needless to say also that the theories of socialism have been held in connexion with the most varying opinions in philosophy and religion. A great deal of the historic socialism has been regarded as a necessary implicate of idealism. Most of the prevailing socialism of the day is based on the frankest and most outspoken revolutionary materialism. On the other hand, many socialists hold that their system is a necessary outcome of Christianity, that socialism and Christianity are essential the one to the other; and it should be said that the ethics of socialism are closely akin to the ethics of Christianity, if not identical with them.

Great changes implied in socialism.

Still it should be insisted that the basis of socialism is economic, involving a fundamental change in the relation of labour to land and capital,—a change which will largely affect production, but will entirely revolutionize the existing system of distribution. But, while its basis is economic, socialism implies and carries with it a change in the political, ethical, technical, and artistic arrangements and institutions of society which would constitute a revolution greater probably than has ever taken place in human history, greater than the transition from the ancient to the mediæval world, or from the latter to the existing order of society. In the first place, such a change generally assumes as its political complement the most thoroughly democratic organization of society. The early socialism of Owen and Saint-Simon was marked by not a little of the autocratic spirit; but the tendency of the present socialism is more and more to ally itself with the most advanced democracy. Socialism, in fact, claims to be the economic complement of democracy, maintaining that without a fundamental economic change political privilege has neither meaning nor value. In the second place, socialism naturally goes with an unselfish or altruistic system of ethics. The most characteristic feature of the old societies was the exploitation of the weak by the strong under the systems of slavery, serfdom, and wage-labour. Under the socialistic régime it is the privilege and duty of the strong and talented to use their superior force and richer endowments in the service of their fellow-men without distinction of class or nation or creed. In the third place, socialists maintain that under their system and no other can the highest excellence and beauty be realized in industrial production and in art, whereas under the present system beauty and thoroughness are alike sacrificed to cheapness, which is a necessity of successful competition. Lastly, the socialists refuse to admit that individual happiness or freedom or character would be sacrificed under the social arrangements they propose. They believe that under the present system a free and harmonious development of individual capacity and happiness is possible only for the privileged minority, and that socialism alone can open up a fair opportunity for all. They believe, in short, that there is no opposition whatever between socialism and individuality rightly understood, that these two are complements the one of the other, that in socialism alone may every individual have hope of free development and a full realization of himself.

Essence of socialism.

Having seen, then, how wide a social revolution is implied in the socialistic scheme of reconstruction, let us repeat (1) that the essence of the theory consists in this,—associated production with a collective capital with the view to an equitable distribution. In the words of Schäffle, "the Alpha and Omega of socialism is the transformation of private competing capitals into a united collective capital" (*Quintessenz des Socialismus*). A. Wagner's more elaborate definition of it (in his *Grundlegung*) is entirely in agreement with that of Schäffle. This is the principle on which all the schools of socialism, however opposed otherwise, are at one. Such a system, while insisting on collective capital (including land), is quite consistent with private property in other forms, and with perfect freedom in the use of one's own share in the equitable distribution of the produce of the associated labour. A thoroughgoing socialism demands that this principle should be applied to the capital and production of the whole world; only then can it attain to supreme and perfect realization. But a sober-minded socialism will admit that the various intermediate stages in which the principle finds a partial application are so far a true and real development of the socialistic idea. (2) Socialism is both a theory of social evolution and a working force in the history of the 19th century. Some of the most eminent socialists, such as Rodbertus, regard their theory as a prophecy concerning the social development of the future rather than as a subject of agitation. In their view socialism is the next stage in the evolution of society, destined after many generations to supersede capitalism, as capitalism displaced feudalism and feudalism succeeded to slavery. Even the majority of the most active socialists consider the question as still in the stage of agitation and propaganda, their present task being that of enlightening the masses until the consummation of the present social development, and the declared bankruptcy of the present social order, shall have delivered the world into their hands. Socialism, therefore, is for the most part a theory affecting the future, more or less remote, and has only to a limited degree gained a real and practical footing in the life of our time. Yet it should not be forgotten that its theories have most powerfully affected all the ablest recent economic writers of Germany, and have even considerably

modified German legislation Its influence is rapidly growing among the lower and also among the most advanced classes in almost every country dominated by European culture, following as a destroying negation the development of capitalism (3) In its doctrinal aspects socialism is most interesting as a criticism of the present economic order, of what socialists call the capitalistic system, with which the existing land system is connected Under the present economic order land and capital (the material and instruments without which industry is impossible) are the property of a class, employing a class of wage-labourers handicapped by their exclusion from land and capital Competition is the general rule by which the share of the members of those classes in the fruits of production is determined Against this system critical socialism is a reasoned protest, and it is at issue also with the prevailing political economy, in so far as it assumes or maintains the permanence or righteousness of this economic order Of the economic optimism implied in the historic doctrine of *laissez-faire* socialism is an uncompromising rejection (4) Socialism is usually regarded as a phase of the struggle for the emancipation of labour, for the complete participation of the working classes in the material, intellectual, and spiritual inheritance of the human race This is certainly the most substantial and most prominent part of the socialist programme, the working classes being the most numerous and the worst sufferers from the present régime This view, however, is rather one-sided, for socialism claims not less to be in the interest of the small capitalist gradually crushed by the competition of the larger, and in the interest also of the large capitalist, whose position is endangered by the huge unmanageableness of his success, and by the world-wide economic anarchy from which even the greatest are not secure Still it is the deliverance of the working class that stands in the front of every socialistic theory, and, though the initiative in socialist speculation and action has usually come from the middle and upper classes, yet it is to the working men that they generally appeal

While recognizing the great confusion in the use of the word "socialism," we have treated it as properly a phenomenon of the 19th century, beginning in France with Saint-Simon and Fourier, in England with Robert Owen, and most powerfully represented at the present day by the school of Karl Marx As we have seen, however, there are definitions of the word which would give it a wider range of meaning and a more ancient beginning, compared with which capitalism is but of yesterday,—which would, in fact, make it as old as human society itself In the early stages of human development, when the tribe or the village community was the social unit, the subordination of the individual to the society in which he dwelt was the rule, and common property was the prevalent form In the development of the idea of property, especially as regards land, three successive historical stages are broadly recognized,—common property and common enjoyment of it, common property and private enjoyment, private property and private enjoyment The last form did not attain to full expression till the end of the 18th century, when the principle of individual freedom, which was really a reaction against privileged restriction, was proclaimed as a positive axiom of government and of economics The free individual struggle for wealth and for the social advantages dependent on wealth is a comparatively recent thing In all periods of history the state reserved to itself the right to interpose in the arrangements of property,—sometimes in favour of the poor, as in the case of the English poor law, which may thus be regarded as a socialistic measure Moreover, all through history revolts in favour of a rearrangement of property have been very frequent And in the societies of the Catholic Church we have a permanent example of common property and a common enjoyment of it

Early forms

How are we to distinguish the socialism of the 19th century from these old world phenomena, and especially from the communism[1] which has played so great a part in history? To this query socialists, especially of the school of Marx, have a clear and precise answer Socialism is a stage in the evolution of society which could not arrive till the conditions necessary to it had been established The first and most essential of these was the development of the great industrialism which after a long period of preparation and gradual growth began to reach its culminating point with the inventions and technical improvements, with the application of steam and the rise of the factory system, in England towards the end of the 18th century Under this system industry was organized into a vast social operation, and was thus already socialized, but it was a system that was exploited by the individual owner of the capital at his own pleasure and for his own behoof Under the pressure of the competition of the large industry, the small capitalist is gradually crushed out, and the working producers become wage-labourers organized and drilled in immense factories and workshops The development of this system still continues and is enveloping the whole world Such is the industrial revolution Parallel with this a revolution in the world of ideas equally great and equally necessary to the rise of socialism has taken place This change of thought which made its world-historic announcement in the French Revolution made reason the supreme judge and had freedom for its great practical watchword It was represented in the economic sphere by the school of Adam Smith Socialism was an outcome of it too, and first of all in Saint-Simon and his school professed to give the positive and constructive corrective to a negative movement which did not see that it was merely negative and therefore temporary In other words, Saint-Simon may be said to aim at nothing less than the completion of the work of Voltaire, Rousseau, and Adam Smith Thus socialism professes to be the legitimate child of two great revolutions,—of the industrial revolution which began to establish itself in England towards the end of the 18th century, and of the parallel revolution in thought which about the same time found most prominent expression in France Robert Owen worked chiefly under the influence of the former, Saint-Simon and Fourier grew up under the latter The conspiracy of Babeuf is properly to be regarded as a crude revolutionary communism not essentially different from the rude efforts in communism made in earlier periods of history With Saint-Simon and Owen historic socialism really begins, and is no longer an isolated fact, but has had a continuous and widening development, the succession of socialistic teaching and propaganda being taken up by one country after another throughout the civilized world

Genesis of socialism

Saint-Simon, Owen

We have seen, then, that the rise of socialism as a new and reasoned theory of society was relative to the industrial revolution and to the ideas proclaimed in the French Revolution, prominent among which, besides the much emphasized idea of freedom and the less easily realized ideals of equality and fraternity, was the conception of the worth and dignity of labour Though Owen was most largely influenced by the former and Saint-Simon and Fourier by the latter, it is certain that all three were

[1] As used in current speech, and also in economics, no very definite line of distinction between communism and socialism can be drawn Generally speaking communism is a term for a system of common property, and this should be accepted as the reasonably correct usage of the word, but even by socialists it is frequently used as practically synonymous with socialism Collectivism is a word which has recently come into vogue to express the economic basis of socialism as above explained

greatly affected by both the new movements. The motive power in Owen's career was the philanthropy and humanitarianism of the 18th century. He had grown up in the midst of the industrial revolution; he was one of the most successful pioneers in the improvement of the cotton manufacture. No one could be more deeply conscious of the enormous abuses of the factory system; and no one better knew the wonderful services it could render if technical improvement were only made subordinate to human well-being. In the career of Owen we see the new spirit of the 18th century seeking to bring the mechanism of the new industrial system under the direction of a nobler principle, in which the good of all should be the great and sole aim. The position of Saint-Simon was considerably different, yet akin. As Owen had before his eyes the evils of a young but gigantic industrialism, Saint-Simon contemplated the hoary abuses of an idle and privileged feudalism, fearfully shaken no doubt by the Revolution, but still strong in Europe, and in France as elsewhere powerfully revived during the period after Waterloo. Saint-Simon saw that a new world, an industrial world resting on labour, had arisen, while the old feudal and theological world—*fainéant* courtiers and a clergy steeped in ignorance—still ruled. All this array of parasites, who had no longer any useful function to perform for society, Saint-Simon sought to replace by the industrial chiefs and scientific leaders as the real working heads of the French people. Only he expected that these exceptionally gifted men, instead of exploiting the labour of others, should control an industrial France for the general good. Neither Owen nor Saint-Simon was revolutionary in the ordinary sense. Owen was most anxious that the English and other Governments should adopt his projects of socialistic reform. Leading statesmen and royal personages befriended him. He had no faith in the political reforms of 1832; he reckoned the political side of chartism as of no account, and he preferred socialistic experiment under autocratic guidance until the workmen should be trained to rule themselves. The same autocratic tendency was very pronounced in Saint-Simon and his school. His first appeal was to Louis XVIII. He wished to supersede the feudal aristocracy by a working aristocracy of merit. His school claim to have been the first to warn the Governments of Europe of the rise of revolutionary socialism. (For further information as to Saint-Simon and his school, see SAINT-SIMON.) The good and bad aspects of the Saint-Simon socialism are too obvious to require elucidation in this article. The antagonism between the old economic order and the new had only begun to declare itself. The extent and violence of the disease were not yet apparent; both diagnosis and remedy were superficial and premature. Such deep-seated organic disorder was not to be conjured away by the waving of a magic wand. The movement was all too utopian and extravagant in much of its activity. The most prominent portion of the school attacked social order in its essential point—the family morality—adopting the worst features of a fantastic, arrogant, and prurient sacerdotalism, and parading them in the face of Europe. Thus it happened that a school which attracted so many of the most brilliant and promising young men of France, which was so striking and original in its criticism of the existing condition of things, which was so strong in the spirit of initiative, and was in many ways so noble, unselfish, and aspiring, sank amidst the laughter and indignation of a scandalized society.

Outlines of its history. The beginning of socialism may be dated from 1817, the year when Owen laid his scheme for a socialistic community before the committee of the House of Commons on the poor law, the year also that the speculations of Saint-Simon definitely took a socialistic direction. The outlines of the history of socialism are very simple. Till 1850 there was a double movement in France and England. In the former country after Saint-Simon and Fourier the movement was represented chiefly by Proudhon and Louis Blanc. In England after Owen the movement was taken up by the body of Christian socialists associated with Maurice and Kingsley. The more recent socialism is due chiefly to German and also Russian thinkers, but is generally international both in sympathy and activity.

Fourier. Considered as a purely literary and speculative product, the socialism of Fourier was prior to those of both Owen and Saint-Simon. His great work, *Théorie des Quatre Mouvements*, was published as early as 1808. The socialism of Fourier, however, scarcely attracted any attention and exercised no influence till those of Owen and Saint-Simon were on the decline. His system is one in which the wildest fantasy is mixed with ingenious theory and the most searching criticism of the present competitive system; even yet it is almost unrivalled in pungency and effectiveness. The pantheistic conception of the world which underlay the Saint-Simonian theory of the "rehabilitation of the flesh" formed the basis also of the social ethics and arrangements of Fourier. According to Fourier, evil is the artificial product and attendant of civilization, the result of perverted human institutions, which have run counter to the ordinances of the Creator in pronouncing passions and affections to be bad which are simply natural. Between the creature and the Creator there have been 5000 years of misunderstanding. There is but one way of removing this misunderstanding,—to give a free and healthy and complete development to our passions. This Fourier sought to accomplish in his *phalanges*, which, united in a system of free federation, would, as he believed, soon cover the world (see FOURIER).

Revolution of 1830. The year 1830 was an important turning-point in the history of socialism. During the fermentation of that time the activity of the Saint-Simon school came to a crisis, and the ideas of Fourier had an opportunity of taking practical effect. Some of the Saint-Simonians joined him. The movement in France was short-lived; and the numerous experiments tried in America were not more successful. One of the most notable societies suggested by Fourier's influence, but entirely free from his immoral tendencies, was Brook Farm, established by George Ripley and other cultured Americans in 1840. A most praiseworthy and successful institution also suggested by the teaching of Fourier is the *Familistère* at Guise (Aisne) conducted by M. Godin. But by far the greatest result of the revolution of 1830 was the definitive establishment of the contrast between the bourgeoisie and the proletariat. Hitherto these two classes had fought side by side against feudalism and the reaction. The bourgeoisie were now rulers, and the proletariat became the revolutionary party, the first outbreak under the new conditions taking place at Lyons in 1831, when the starving workmen rose to arms with the device, "Live working or die fighting." During the latter half of the reign of the bourgeois king Louis Philippe Paris became more than ever the centre of socialistic fermentation. In 1839 Louis Blanc published his *Organisation du Travail*, and Cabet his *Voyage en Icarie*. In 1840 Proudhon published his book on property. At this period Paris counted among her visitors Lassalle, the founder of the social democracy of Germany; Karl Marx, the chief of scientific international socialism; and Bakunin, the apostle of anarchism.

Louis Blanc. The socialism of Saint-Simon and Fourier was largely speculative, imaginative, and utopian, and had only a very remote connexion with the practical life of their time. With Louis Blanc (1811-1882) socialism came into real contact with the public history of France. The most con-

spicuous feature of Louis Blanc's teaching was that he demanded the democratic organization of the state as preparatory to social reorganization His system, therefore, had a positive and practical basis, in so far as it allied itself to a dominant tendency in the existing state Louis Blanc was an eminent journalist, born at Madrid, where his father had a high post on the finances of King Joseph His celebrated work on socialism, *Organisation du Travail*, exerted a very large influence on the thought of France The formula of progress, says Louis Blanc, is double in its unity,—moral and material amelioration of the lot of all by the free co-operation of all and their fraternal association He saw, however, that the great end of social reform could not be attained without political reform It was not enough to discover the true methods for inaugurating the principle of association and the organization of labour according to the rules of reason, justice, and humanity It was necessary to have political power on the side of social reform, political power resting on the chambers, on the tribunals, and on the army, not to take it as an instrument was to meet it as an obstacle For these reasons he wished to see the state constituted on a thoroughly democratic basis as the first condition of success He demanded that the state thus reformed should establish associations, which he called *social workshops*, for co-operative production The money should be provided by the state, which also should draw up the rules The state should appoint the functionaries for the first year After that the workmen should elect their own managers "Though the false and anti-social education given to the present generation makes it difficult to find any other motive of emulation and encouragement than a higher salary, the wages will be equal, as the ideas and character of men will be changed by an absolutely new education" Louis Blanc hoped that private firms would not be able to exist under the competition of such associations, and that the latter would in time absorb all the production of the country Notwithstanding the influence exerted by Louis Blanc and the working men's party in the provisional Government of 1848, it cannot be said that his plans obtained a fair hearing or a fair trial His schemes were certainly not carried out in the national workshops of that year These were really a travesty of Louis Blanc's proposals, instituted expressly to discredit them They were simply means of finding work for a motley proletariat thrown out of employment during the period of revolutionary disturbance, and these men were put to unproductive work, whereas of course Louis Blanc contemplated nothing but productive work, and the men he proposed to invite to join his associations were to give guarantees of character The months following the revolution of February were, moreover, a period of industrial stagnation and insecurity, when any new project of trade, either on the old or new lines, had very little prospect of success This remark applies largely also to the private associations for co-operative production subsidized by the republican Government These were more closely akin to the plans of Louis Blanc, but to them also the times were unfavourable, and the help given them was both scanty and injudicious As one of the leaders during this difficult crisis Louis Blanc had neither personal force nor enduring political influence sufficient to secure any considerable success for his cause He was an amiable and genial enthusiast, but without weight enough to be a controller of men on a wide scale The labour conferences at the Luxembourg, over which he presided, ended also as his opponents desired, without any tangible result The proletariat at Paris, incensed at the closing of the national workshops, rose in armed insurrection, which was overthrown by Cavaignac in the sanguinary days of June (see CAVAIGNAC) Louis Blanc was in no way implicated in the revolt, but he found it necessary to go into exile in England With the bloodshed of the days of June French socialism ceased for a time to be a considerable force Socialism in the true acceptation of the word was indeed only partially responsible for the insurrection It was a rising of a proletariat not particularly versed in theories of social reconstruction, but deeply incensed at the reactionary measures of their rulers Inasmuch, however, as it destroyed the most enterprising leaders of the workmen and quelled the spirit of the remainder, it thoroughly repressed the tendency to innovation amongst them for a long time to come, while the false prosperity of the second empire removed their most crying grievances Under Napoleon III there was consequently comparative quietness in France Even the International had very little influence on French soil, though French working men had an important share in starting it

England Owen

Compared with the parallel movement in France the early socialism of England had an uneventful history (see OWEN) In order to appreciate the significance of Owen's work it is necessary to recall some of the more important features of the social condition of the country in his time The English worker had no fixed interest in the soil He had no voice either in local or national government He had little education or none at all His dwelling was wretched in the extreme The right even of combination was denied him till 1824 The wages of the agricultural labourer were miserably low The workman's share in the benefits of the industrial revolution was doubtful Great numbers of his class were reduced to utter poverty and ruin by the great changes consequent on the introduction of improved machinery, the tendency to readjustment was slow and continually disturbed by fresh change The hours of work were mercilessly long He had to compete against the labour of women, and of children brought frequently at the age of five or six from the workhouses These children had to work the same long hours as the adults, and they were sometimes strapped by the overseers till the blood came Destitute as they so often were of parental protection and oversight, with both sexes huddled together under immoral and insanitary conditions, it was only natural that they should fall into the worst habits, and that their offspring should to such a lamentable degree be vicious, improvident, and physically degenerate In a country where the labourers had neither education nor political or social rights, and where the peasantry were practically landless serfs, the old English poor-law was only a doubtful part of an evil system All these permanent causes of mischief were aggravated by special causes connected with the cessation of the Napoleonic wars, which are well known It was in such circumstances, when English pauperism had become a grave national question, that Owen first brought forward his scheme of socialism (1817) In his communities, which were intended to be self-dependent units, Owen sought to provide the best education and the constant exercise of unselfish intelligence, to unite the advantages of town and country, and to correct the monotonous activity of the factory with the greatest variety of occupation, while utilizing all the latest improvements in industrial technique The causes of Owen's failure in establishing his communities are obvious enough Apart from the difficulties inherent in socialism, he injured the social cause by going out of his way to attack the historic religions and the accepted views on marriage, by his quixotry and tediousness, by refusing to see that for the mass of men measures of transition from an old to a new system must be adopted If he had been truer to his earlier methods and retained the autocratic guidance of his experiments, the chances of

success would have been greater Above all, Owen had too great faith in human nature, and he did not understand the laws of social evolution His great doctrine of the influence of circumstances in the formation of character was only a very crude way of expressing the law of social continuity so much emphasized by recent socialism He thought that he could break the chain of continuity, and as by magic create a new set of circumstances, which would forthwith produce a new generation of rational and unselfish men The time was too strong for him, and the current of English history swept past him Even a very brief account of Owen, however, would be incomplete without indicating his relation to Malthus Against Malthus he showed that the wealth of the country had, in consequence of mechanical improvement, increased out of all proportion to the population The problem, therefore, was not to restrict population, but to institute rational social arrangements and to secure a fair distribution of wealth Whenever the number of inhabitants in any of his communities increased beyond the maximum, new ones should be created, until they extended over the whole world, uniting all in one great republic with one interest There would be no fear of over-population for a long time to come Its evils were then felt in Ireland and other countries, but that condition of things was owing to the total want of the most ordinary common sense on the part of the blinded authorities of the world The period would probably never arrive when the earth would be full, but if it should the human race will be good, intelligent, and rational, and would know much better than the present irrational generation how to provide for the occurrence Such was Owen's socialist treatment of the population problem

In England the reform of 1832 had the same effect as the revolution of July (1830) in France it brought the middle class into power, and by the exclusion of the workmen emphasized their existence as a separate class The discontent of the workmen now found expression in Chartism As is obvious from the contents of the charter, Chartism was most prominently a demand for political reform, but both in its origin and in its ultimate aim the movement was more essentially economic As regards the study of socialism, the interest of this movement lies greatly in the fact that in its organs the doctrine of "surplus value" afterwards elaborated by Marx as the basis of his system is broadly and emphatically enunciated While the worker produces all the wealth, he is obliged to content himself with the meagre share necessary to support his existence and the surplus goes to the capitalist, who, with the king, the priests, lords, esquires, and gentlemen, lives upon the labour of the working man (*Poor Man's Guardian*, 1835)

Chartism

Christian socialism in England

After the downfall of Owenism began the Christian socialist movement in England (1848-52), of which the leaders were Maurice, Kingsley, and Mr Ludlow The abortive Chartist demonstration of April 1848 excited in Maurice and his friends the deepest sympathy with the sufferings of the English working class,—a feeling which was intensified by the revelations regarding "London Labour and the London Poor" published in the *Morning Chronicle* (1849) Mr Ludlow, who had in France become acquainted with the theories of Fourier, was the economist of the movement, and it was with him that the idea originated of starting co-operative associations In *Politics for the People*, in the *Christian Socialist*, in the pulpit and on the platform, and in *Yeast* and *Alton Locke*, well-known novels of Kingsley, the representatives of the movement exposed the evils of the competitive system, carried on an unsparing warfare against the Manchester school, and maintained that socialism rightly understood was only Christianity applied to social reform Their labours in insisting on ethical and spiritual principles as the true bonds of society, in promoting associations, and in diffusing a knowledge of co-operation were largely beneficial In the north of England they joined hands with the co-operative movement inaugurated by the Rochdale pioneers (1844) under the influence of Owenism Productive co-operation made very little progress, but co-operative distribution has proved a great success

In 1852 the twofold socialist movement in France and England had come to a close, leaving no visible result of any importance From that date the most prominent leaders of socialism have been German and Russian To reach the beginnings of German socialism we must go back a little, as it took its rise in the years preceding the revolution of 1848 Its most conspicuous chiefs are Karl Marx, Friedrich Engels, Lassalle, and Rodbertus (for the last two, see LASSALLE and RODBERTUS) The greatest and most influential of the four was unquestionably Marx, who and his like-minded companion Engels are the acknowledged heads of the "scientific and revolutionary" school of socialism, which has its representatives in almost every country of the civilized world, and is generally recognized as the most serious and formidable form of socialism

Karl Marx

Karl Marx (1818-1883) was of Jewish extraction He was born at Treves, and studied at Berlin and Bonn, but neglected the speciality of law, which he nominally adopted, for the more congenial subjects of philosophy and history He was a zealous student and apparently an adherent of Hegelianism, but soon gave up his intention of following an academic career as a teacher of philosophy and joined the staff of the *Rhenish Gazette*, published at Cologne as an organ of the extreme democracy In 1843, after marrying the sister of the Prussian minister Von Westfalen, he removed to Paris, where he applied himself to the study of economic and social questions and began to publish those youthful writings which must be reckoned among the most powerful expositions of the early form of German socialism With Arnold Ruge he edited the *Deutsch-Französische Jahrbücher* In 1845 he was expelled from Paris and settled in Brussels, where he published his *Discours sur le Libre Échange*, and his criticism of Proudhon's *Philosophie de la Misère*, entitled *Misère de la Philosophie* In Paris he had already met Friedrich Engels, who was destined to be his lifelong and loyal friend and companion-in-arms, and who in 1845 published his important work *Die Lage der arbeitenden Klasse in England* The two friends found that they had arrived at a complete identity of opinion, and an opportunity soon occurred for an emphatic expression of their common views A society of socialists, a kind of forerunner of the International, had established itself in London, and had been attracted by the new theories of Marx and the spirit of strong and uncompromising conviction with which he advocated them They entered into relation with Marx and Engels, the society was reorganized under the name of the Communist League, and a congress was held, which resulted (1847) in the framing of the *Manifesto of the Communist Party*, which was published in most of the languages of western Europe, and is the first proclamation of that revolutionary socialism armed with all the learning of the 19th century, but expressed with the fire and energy of the agitator, which in the International and other movements has so startled the world During the revolutionary troubles of 1848 Marx returned to Germany, and along with his comrades Engels, Wolff, &c, he supported the most advanced democracy in the *New Rhenish Gazette* In 1849 he settled in London, where till his death in 1883 he applied himself to the elaboration of his economic views and to the realization of his revolutionary programme During this period he published *Zur Kritik der politischen Oekonomie* (1859),

and the first volume of his great work on capital, *Das Kapital* (1867)

Origin of German socialism

The causes which have variously contributed to the rise of German socialism are sufficiently clear With the accession of the romanticist Frederick William IV to the throne of Prussia in 1840 German liberalism received a fresh expansion At the same time the Hegelian school began to break up, and the interest in pure philosophy began to wane It was a time of disillusionment, of dissatisfaction with idealism, of transition to realistic and even to materialistic ways of thinking This found strongest expression in the Hegelian left, to which, after the ideals of the old religions and philosophies had proved unsubstantial, there remained as solid residuum the real fact of man with his positive interests in this life The devotion and enthusiasm which had previously been fixed on ideal and spiritual conceptions were concentrated on humanity To adherents of the Hegelian left, who had been delivered from intellectual routine by the most intrepid spirit of criticism, and who, therefore, had little respect for the conventionalisms of a feudal society, it naturally appeared that the interests of humanity had been cruelly sacrificed in favour of class privilege and prejudice The greatest thinkers of Germany had recognized the noble elements in the French Revolution To recognize also the noble and promising features of French socialism was a natural thing, especially for Germans who had been in Paris,—the great hearth of the new ideas Here they found themselves definitely and consciously in presence of the last and greatest interest of humanity, the suffering and struggling proletariat of western Europe, which had so recently made its definite entry in the history of the world Thus socialism became a social, political, and economic creed to Karl Marx and his associates But they felt that the theories which preceded them were wanting in scientific basis, and it was henceforward the twofold aim of the school to give scientific form to socialism and to propagate it in Europe by the best and most effective revolutionary methods

Views of Marx and his school

The fundamental principle of the Marx school and of the whole cognate socialism is the theory of "surplus value,"—the doctrine, namely, that, after the labourer has been paid the wage necessary for the subsistence of himself and family, the surplus produce of his labour is appropriated by the capitalist who exploits it This theory is an application of the principle that labour is the source of value, which was enunciated by many of the old writers on economics, such as Locke and Petty, which was set forth with some vagueness and inconsistency by Adam Smith, and was more systematically expounded by Ricardo The socialistic application of the principle in the doctrine of surplus value had been made both by Owenites and chartists It was to prevent this appropriation of surplus value by capitalists and middlemen that the Owen school tried the system of exchange by labour notes in 1832,—the value of goods being estimated in labour-time, represented by labour notes The principle that labour is the source of value has been accepted in all its logical consequences by Marx, and by him elaborated with extraordinary dialectical skill and historical learning into the most complete system of socialism that has ever been formulated A like application of the principle but in a less rigorous fashion has been made by Rodbertus, and it is the same theory that underlies the extravagancies and paradoxes of Proudhon The question whether the priority in the scientific development of the principle is due to Marx or Rodbertus cannot be fully discussed here But it may be said that, while the *Social Letters* of Rodbertus to Von Kirchmann were published in 1850, the importance of the principle was understood by the Marx school as early as 1845, and in a broad and general way had indeed become the common property of socialists The historical importance and scientific worth of the writings of Rodbertus should not be overlooked, nor are they likely to be when so much attention has been given to him by A Wagner and other distinguished German economists But in the great work of Marx the socialist theory is elaborated with a fulness of learning and a logical power to which Rodbertus has no claim With Marx the doctrine of surplus value receives its widest application and development, it supplies the key to his explanation of the history and influence of capital, and consequently of the present economic era, which is dominated by it It is the basis, in fact, of a vast and elaborate system of social philosophy In any case it is an absurdity as well as an historical error to speak of Marx as having borrowed from Rodbertus Marx was an independent thinker of great originality and force of character, who had made the economic development of modern Europe the study of a laborious lifetime, and who was in the habit, not of borrowing, but of strongly asserting the results of his own research and of impressing them upon other men

Surplus value

Capital

The great work of Marx may be described as an exposition and criticism of capital But it is also indirectly an exposition of socialism, inasmuch as the historical evolution of capital is governed by natural laws, the inevitable tendency of which is towards socialism It is the great aim of Marx to reveal the law of the economic movement of modern times Now the economic movement of modern times is dominated by capital Explain, therefore, the natural history of capital, the rise, consolidation, and decline of its supremacy as an evolutionary process, and you forecast the nature of that into which it is being transformed,—socialism Hence the great task of the Marx school is not to preach a new economic and social gospel, not to provide ready-made schemes of social regeneration after the fashion of the early socialists, nor to counteract by alleviating measures the wretchedness of our present system, but to explain and promote the inevitable process of social evolution, so that the domination of capital may run its course and give place to the higher system that is to come

The characteristic feature of the régime of capital, or, as Marx usually calls it, the capitalistic method of production, is, that industrial operations are carried on by individual capitalists employing free labourers, whose sole dependence is the wage they receive Those free labourers perform the function fulfilled in other states of society by the slave and the serf It is the tendency of the capitalistic system to consolidate those two classes,—the capitalist class, enriching itself on the profits of industry, which they control in their own interest, and the class of workers, nominally free, but without land or capital, divorced, therefore, from the means of production, and dependent on their wages,—the modern proletariat The great aim of the capitalist is the increase of wealth through the accumulation of his profits This accumulation is secured by the appropriation of what the socialists call surplus value The history of the capitalistic method of production is the history of the appropriation and accumulation of surplus value To understand the capitalistic system is to understand surplus value With the analysis of value, therefore, the great work of Marx begins

The wealth of the societies in which the capitalistic method of production prevails appears as an enormous collection of commodities A commodity is in the first place an external object adapted to satisfy human wants, and this usefulness gives it value in use, makes it a use value These use values form the material of wealth, whatever its social form may be In modern societies, where the business of production is carried on to meet the

Value and labour

demands of the market, for exchange, these use values appear as exchange values. Exchange value is the proportion in which use values of different kinds exchange for each other. But the enormous mass of things that circulate in the world market exchange for each other in the most different proportions. They must, however, have a common quality or they could not be compared. This common quality cannot be any of the natural properties of the commodities. In the business of exchange one thing is as good as another, provided you have it in sufficient quantity. Leaving out of consideration, therefore, the physical qualities that give commodities use value, we find in them but one common characteristic,—that they are all products of human labour. They are all crystallized forms of human labour. It is labour applied to natural objects that gives them value. What constitutes value is the human labour embodied in commodities. And the relation of exchange is only a phase of this value, which is therefore to be considered independently of it. Further, the labour-time spent in producing value is the measure of value, not this or that individual labour, in which case a lazy or unskilled man would produce as great a quantity of value as the most skilful and energetic. We must take as our standard the average labour-force of the community. The labour-time which we take as the measure of value is the time required to produce a commodity under the normal social conditions of production with the average degree of skill and intensity of labour. Thus labour is both the source and the measure of value.

Development of capitalistic régime.

As we have seen, the characteristic feature of the capitalistic system of production is that industry is controlled by capitalists employing free wage-labour; that is, while the capitalist owns and controls the means of production, the free labourer has lost all ownership in land and capital and has nothing to depend on but his wage. This condition of things was established only after a long and gradual process of social change, which Marx copiously illustrates from the history of England, as the classic land of the fully developed capitalism. In the Middle Ages the craftsman and peasant were the owners of the small means of production then extant, and they produced for their own needs and for their feudal superior; only the superfluity went into the general market. Such production was necessarily small, limited, and technically imperfect. Towards the close of the Middle Ages a great change set in caused by a remarkable combination of circumstances,—the downfall of the feudal system and of the Catholic Church, the discovery of America and of the sea route to India. Through the breaking up of the feudal houses with their numerous retainers, through the transformation of the old peasant-holdings into extensive sheep-runs, and generally through the prevalent application of the commercial system to the management of land instead of the Catholic and feudal spirit, the peasantry were driven off the land, a multitude of people totally destitute of property were thrown loose from their old means of livelihood, and were reduced to vagabondage or forced into the towns. It was in this way that the modern proletarians made their tragic entry in history. On the other hand, there was a parallel development of the capitalist class, brought about by the slave trade, the exploitation of the American colonies and of both the Indies, and by the robbery, violence, and corruption which attended the transference of the land from the Catholic and feudal to the modern régime. The opening and extension of the great world market, moreover, gave a great stimulus to industry at home. The old guilds having already been expropriated and dissolved, the early organization of industry under the control of an infant capitalism passed through its first painful and laborious stages, till with the great mechanical inventions, with the application of steam as the motive-power, and the rise of the factory system towards the close of the 18th century, the great industrial revolution was accomplished, and the capitalistic method of production attained to its colossal manhood.

Capitalistic appropriation.

The capitalistic system thus established, we have to remember that in all its forms, and throughout all the stages of its history the great aim of the capitalist is to increase and consolidate his gains through the appropriation of surplus value. This appropriation of surplus value is a very old phenomenon in human society. In all the forms of society which depended on slave labour, and under the feudal régime, the appropriation of the results of other men's labour was open and undisguised. Under the capitalistic system it is disguised under the form of free contract. The workman appears on the labour market with the sole commodity of which he has to dispose, his labour force, and sells it for a specified time at the price it can bring, which we call his wage, and which is equivalent to the average means of subsistence required to support himself and to provide for the future supply of labour (in his family). But the labour force of the workman as utilized by the capitalist in the factory or the mine produces a net value in excess of his wage. That is, over and above his entire outlay, including the wage paid to his workmen, the capitalist finds himself in possession of a surplus, which can only represent the "unpaid labour" of his workmen. This surplus is the surplus value of Karl Marx, the product of unpaid labour. This it is which the capitalist seeks to obtain and to accumulate by all the methods available. These methods are described by Marx with great detail and elaboration through several hundred pages of his first volume. His account, supported at every step by long and copious citations from the best historical authorities and from the blue-books of the various parliamentary commissions, is a lurid and ghastly picture of the many abuses of English industrialism. It is the dark and gloomy reverse of the industrial glories of England. The fearful prolongation of the hours of labour, the merciless exploitation of women, and of children from the age of infancy, the utter neglect of sanitary conditions, whatever could lessen the costs of production and swell the profits of the capitalist, though every law of man and nature were violated in the process,—such are the historical facts which Marx emphasizes and illustrates with an overwhelming force of evidence. They receive ample confirmation in the history of the English Factory Acts, imposed on greedy and unscrupulous capitalists after a severe struggle prolonged for half a century, and required to prevent the moral and physical ruin of the industrial population.

Results of capitalistic system.

It will be seen that the first and most conspicuous result of the capitalistic system is that, while production is a social operation carried on by men organized and associated in factories, the product is appropriated by individual capitalists; it is social production and capitalistic appropriation. Another conspicuous and important result is that, while we have this organization in the factories, we have outside of them all the anarchy of competition. We have the capitalistic appropriators of the product of labour contending for the possession of the market, without systematic regard to the supply required by that market—each one filling the market only as dictated by his own interest, and trying to outdo his rivals by all the methods of adulteration, bribery, and intrigue,—an economic war hurtful to the best interests of society. With the development of the capitalistic system machinery is more and more perfected, for to neglect improvement is to succumb in the struggle; the improved machinery renders labour super-

fluous, which is accordingly thrown idle and exposed to starvation. But, as the technique improves, the productive power of industry increases, and continually tends more and more to surpass the available needs of the market, wide as it is. The consequence is that the market tends to be overstocked even to absolute repletion, goods will not sell, and a commercial crisis is established, in which we have the remarkable phenomenon of widespread panic, misery, and starvation resulting from a superabundance of wealth,—a "crise plethorique," as Fourier called it, a crisis due to a plethora of wealth. These crises occur at periodic intervals, each one severer and more widespread than the preceding, until they now tend to become chronic and permanent, and the whole capitalistic world staggers under an atlantean weight of ill-distributed wealth. Thus the process goes on in obedience to its own inherent laws. Production is more and more concentrated in the hands of mammoth capitalists and colossal joint-stock companies, under which the proletariat are organized and drilled into vast industrial armies. But, as crisis succeeds crisis, until panic, stagnation, and disorder are universal, it becomes clear that the bourgeoisie are no longer capable of controlling the industrial world. The incompatibility between social production and anarchic distribution decidedly declares itself. With the progress of democracy the proletariat seizes the political power, and through it at last takes complete control over the economic functions of society. It expropriates the private capitalist and appropriating the means of production manages them in its own interest, which is the interest of society as a whole; society passes into the socialistic stage through a revolution determined by the natural laws of social evolution, and not by a merely arbitrary exercise of power. It is a result determined by the inherent laws of social evolution, independent of the will and purpose of individual men. All that the most powerful and clear-sighted intellect can do is to learn to divine the laws of the great movement of society, and to shorten and alleviate the birth-pangs of the new era. The efforts of reactionaries of every class to turn the wheel of history backwards are in vain. But an intelligent appreciation of its tendencies and a willing co-operation with them will make progress easier, smoother, and more rapid.

It will have been seen that what Marx and his school contemplate is an economic revolution brought about in accordance with the natural laws of historic evolution. But in order to understand the full import of this revolution in the mind of Marx we must remember that he regards the economic order of society as the groundwork of the same, determining all the other forms of social order. The entire legal and political structure as well as philosophy and religion are constituted and controlled in accordance with the economic basis. This is in harmony with his method and his conception of the world, which is the Hegelian reversed. "For Hegel the thought process, which he transforms into an independent subject under the name idea, is the creator of the real, which forms only its external manifestation. With me, on the contrary, the ideal is nothing else than the material transformed and translated in the human brain." His conception of the world is a frank and avowed materialism. His method is the dialectic applied to a world thus understood; the business of inquiry, namely, is to trace the connexion and concatenation in the links that make up the process of historic evolution, to investigate how one stage succeeds another in the development of society, the facts and forms of human life and history not being stable and stereotyped things, but the ever-changing manifestations of the fluent and unresting real, the course of which it is the duty of science to reveal. The whole position of the Marx school may therefore be characterized as evolutionary and revolutionary socialism, based on a materialistic conception of the world and of human history. Socialism is a social revolution determined by the laws of historic evolution—a revolution which, changing the economic groundwork of society, will change the whole structure.

Criticism of Marx's views.

It will be seen that the work of Marx is a natural history of capital, especially in its relation to labour, and in its most essential features is a development of two of the leading principles of the classic economics,—that labour is the source of value, but that of this value the labourer obtains for himself merely a subsistence wage, the surplus being appropriated by the exploiting capitalist. Marx's great work may be described as an elaborate historical development of this glaring fundamental contradiction of the Ricardian economics, the contradiction between the iron law of wages and the great principle that labour is the source of wealth. Marx's conception of labour is the same as that of Ricardo, and as a logical exposition of the historic contradiction between the two principles on the basis of Ricardo the work of Marx is quite unanswerable. It is obvious, however, that the definition of labour assumed both in Ricardo and Marx is too narrow. The labour they broadly posit as the source of wealth is manual labour. In the early stages of industry, when the market was small and limited and the technique was of the simplest and rudest description, labour in that sense might correctly enough be described as the source of value. But in modern industry, when the market is world-wide, the technique most complex, and the competition most severe, when inventiveness, sagacity, courage, and decision in initiative, and skill in management, are factors so important, no such exclusive place as has been claimed can be assigned to labour. The Ricardian principle, therefore, falls to the ground. And it is not historically true to maintain, as Marx does, that the profits of the capitalist are obtained simply by appropriating the products of unpaid labour. In initiating and managing the capitalist is charged with the most difficult and important part of the work of production. As a natural consequence it follows that Marx is also historically inaccurate in roundly explaining capital as the accumulation of unpaid labour appropriated by the capitalist. In past accumulation, as in the control and management of industry generally, the capitalist has had the leading part. Capital, therefore, is not necessarily robbery, and in an economic order in which the system of free exchange is the rule, and the mutually beneficial interchange of utilities, no objection can be raised to the principle of lending and borrowing of money for interest. In short, in his theory of unpaid labour as supplying the key to his explanation of the genesis and development of the capitalistic system Marx is not true to history. It is the perfectly logical outcome of certain of the leading principles of the Ricardian school, but it does not give an adequate or accurate account of the facts of economic evolution.

It may indeed be maintained that in his theory of unpaid labour Marx is not consistent with the general principles of his own philosophy of social evolution. With him history is a process determined by material forces, a succession of orderly phenomena controlled by natural laws. Now we may waive the objection suggested by the principle enunciated in the Marx school itself, that it is not legitimate to apply ethical categories in judgment on economic processes that are merely natural, which, however, Marx does with revolutionary emphasis throughout some hundreds of pages of his great work. It is more important to point out, in perfect consistency with the principles of the school, that the energy and inventiveness of the early capitalists especially were the most essential factors in determining the existence and development of a

great economic era, and that the assertion of freedom was an indispensable condition in breaking the bonds of the old feudal order, which the new system displaced. Instead, therefore, of living and growing rich on the produce of unpaid labour, the capitalist had a great social and industrial function to perform, and played a great part in historic evolution. The position and function of the workman was subordinate.

There can be no doubt that in his theory of surplus value obtained from unpaid labour Marx as agitator and controversialist has fallen into serious contradiction with himself as scientific historian and philosopher. The theory that labour is the source of value was widely accepted among economists during his early life, and by its justice and nobleness it was well adapted to the comfortable optimism prevalent among so many of the classical school. The economists, however, did not follow the principle to its obvious conclusion, that if labour is the source of wealth the labourer should enjoy it all. It was otherwise with the socialists, who were not slow to perceive the bearing of the theory on the existing economic order. In his controversial treatise against Proudhon Marx gives a list of writers (beginning with the political economy of Hopkins, published in 1822, only five years after the appearance of Ricardo's great work) by whom the principle was applied to revolutionary purposes. Its simplicity and seeming effectiveness must have made it most attractive. As posited by the classic economy and applied by the socialists Marx accepted the principle. It was an unanswerable *argumentum ad hominem* when addressed to an economist of the Ricardian school, but it should have broken down when confronted with historical fact. Nevertheless it was made and continued to be the foundation stone of the system of Marx, and is really its weakest point. His doctrine of surplus value is the vitiating factor in his history of the capitalistic system. The most obvious excuse for him is that he borrowed it from the classic economists. It would be the greatest possible mistake, however, to make this a reason for undervaluing the remarkable services rendered to economics by Karl Marx. He spent forty laborious years almost wholly in exile as the scientific champion of the proletariat. In the combination of learning, philosophic acumen, and literary power he is probably second to no economic thinker of the 19th century. He seems to have been master of the whole range of economic literature, and wielded it with a logical skill not less masterly. But his great strength lay in his knowledge of the technical and economic development of modern industry and in his marvellous insight into the tendencies in social evolution determined by the technical and economic factors. Whether his theories in this department are right or wrong they have suggested questions that will demand the attention of economic thinkers for a long time to come. It is in this department and not in his theory of surplus value that Marx's significance as a scientific economist is to be found.

The great merit of Marx, therefore, lies in the work he has done as scientific inquirer into the economic movement of modern times, as the philosophic historian of the capitalistic era. It is now admitted by all inquirers worthy of the name that history, including economic history, is a succession of orderly phenomena, that each phase in the line of succession is marked by facts and tendencies more or less peculiar to itself, and that laws and principles which we now condemn had formerly an historical necessity, justification, and validity. In accordance with this fundamental principle of historical evolution arrangements and institutions which were once necessary, and originally formed a stage in human progress, may gradually develop contradictions and abuses and thus become more or less antiquated. The economic social and political forms which were the progressive and even adequate expressions of the life of one era become hindrances and fetters to the life of the succeeding times. This, the school of Karl Marx says, is precisely the condition of the present economic order. The existing arrangements of landlord, capitalist, and wage-labourer under free competition are burdened with contradiction and abuse. The life of society is being strangled by the forms which once promoted it. They maintain that the really vital and powerful tendencies of our time are towards a higher and wider form of social and economic organization,—towards socialism. This we believe to be the central point of the whole question, but the fuller discussion of it can more conveniently be postponed to the close of this article, when we come to consider socialism as a whole.

The International.

The opinions of Marx were destined to find expression in two movements, which have played a considerable part in recent history,—the International and the social democracy of Germany. Of the International Marx was the inspiring and controlling head from the beginning, and the German social democracy, though originated by Lassalle, before long fell under Marx's influence. Marx wrote the famous inaugural address of the International and drew up its statutes, maintaining a moderation of tone which contrasted strongly with the outspoken vigour of the communist manifesto of 1847. But it was not long before the revolutionary socialism which underlay the movement gained the upper hand. This found strongest expression in the address drawn up by Marx in 1871 after the suppression of the commune, and entitled *The Civil War in France*. The International was not responsible for the revolt of the commune, which was a rising for the autonomy of Paris, supported chiefly by the lower classes. It was a protest against excessive centralization raised by the democracy of Paris, which has always been far in advance of the provinces, and which found itself in possession of arms after the siege of the town by the Germans. But, while it was prominently an assertion of local autonomy, it was also a revolt against the economic oppression of the moneyed classes, and thus contained within it strong socialistic tendencies. The socialists properly so called were only a small minority. In this address, however, Marx and his associates made themselves morally *solidaire* with the commune. They saw in it a great rising against the existing conditions of the Parisian proletariat, which only partially saw the way of deliverance, but was tired of oppression and full of just indignation against the tyrannous upper classes, that controlled the central government of France. This address, if it tended to increase the prestige of the International, greatly reduced its real influence. Its last meeting as controlled by Marx took place at The Hague in 1872. The chief himself was present, and succeeded in casting out the anarchist following of Bakunin, but it was the expiring effort. See INTERNATIONAL.

German social democracy.

This loss of influence by Marx was in the meantime more than compensated by his success in gaining control over the social democracy of Germany. Of the workmen's unions which had grown so rapidly in Germany in the years following 1860, and which had first been patronized by the Progressist party, some had attached themselves to the national socialism of Lassalle, but many held aloof from that movement, and under the influence of Liebknecht and Bebel were gradually drawn over to the views of Marx. At Lassalle's death in 1864 his "general working-men's union of Germany" numbered only 4610 members. After losing its founder the union had a changeful and somewhat precarious career for a time, and it was only under the presidency of Von Schweitzer, which lasted for four years

(1867-1871), that it began moderately to flourish. In the meantime the adverse party also made considerable progress. The confederation of German unions, which was founded in 1863, declared in 1865 for universal suffrage, pronounced against the Schulze-Delitzsch schemes in 1866, and in the congress at Nuremberg of 1868 by a large majority declared their adhesion to the International. In a great congress at Eisenach in 1869 they founded the "social democratic working-men's party," and in the same year sent representatives to the International congress at Basel. Great efforts were made for a fusion of the Eisenach and the Lassalle party, and this was effected in a congress at Gotha (May 1875). At this congress 25,000 regular members were represented, of whom 9000 belonged to the Marx party and 15,000 to that of Lassalle. The united body assumed the name of the "socialistic working-men's party of Germany," and drew up a programme, which, as the most important manifesto hitherto published by any socialist body, deserves to be given entire.

Programme of socialistic working-men's party.

I. Labour is the source of all wealth and all culture, and as useful work in general is possible only through society, so to society—that is, to all its members—belongs the entire product of labour by an equal right, to each one according to his reasonable wants,—all being bound to work.

In the existing society the instruments of labour are a monopoly of the capitalist class; the subjection of the working class thus arising is the cause of misery and servitude in every form.

The emancipation of the working class demands the transformation of the instruments of labour into the common property of society and the co-operative control of the total labour, with application of the product of labour to the common good, and just distribution of the same.

The emancipation of labour must be the work of the labouring class, in contrast to which all other classes are only a reactionary mass.

II. Proceeding from these principles, the socialistic working-men's party of Germany aims by all legal means at the establishment of the free state and the socialistic society, to destroy the iron law of wages by abolishing the system of wage-labour, to put a term to exploitation in every form, to remove all social and political inequality.

The socialistic working-men's party of Germany, though working first of all within the national limits, is conscious of the international character of the labour movement, and resolved to fulfil all duties which this imposes on the workmen, in order to realize the universal brotherhood of men.

In order to prepare the way for the solution of the social question, the socialistic working-men's party of Germany demands the establishment of socialistic productive associations with state help under the democratic control of the labouring people. The productive associations are to be founded on such a scale both for industry and agriculture that out of them may develop the socialistic organization of the total labour.

The socialistic working-men's party demands as bases of the state—(1) universal, equal, and direct right of electing and voting, with secret and obligatory voting, of all citizens from twenty years of age for all elections and deliberations in the state and local bodies; the day of election or voting must be a Sunday or holiday; (2) direct legislation by the people; questions of war and peace to be decided by the people; (3) universal military duty; a people's army in place of the standing armies; (4) abolition of all exceptional laws, especially as regards the press, unions, and meetings, and generally of all laws which restrict freedom of thought and inquiry; (5) administration of justice by the people; free justice; (6) universal and equal education by the state; compulsory education; free education in all public places of instruction; religion declared to be a private concern.

Within the existing society the socialistic working-men's party of Germany demands—(1) greatest possible extension of political rights and liberties in the sense of the above demands; (2) a single progressive income-tax for state and local purposes, instead of the existing taxes, and especially of the indirect taxes that oppress the people; (3) unrestricted right of combination; (4) a normal working-day corresponding to the needs of society; prohibition of Sunday labour; (5) prohibition of labour of children, and of all women's work injurious to health and morality; (6) laws for the protection of the life and health of workmen; sanitary control of workmen's dwellings; inspection of mines, of factories, workshops, and house labour, by officials chosen by the workmen; an effective employers' liability Act; (7) regulation of prison labour; (8) workmen's funds to be under the entire control of the workmen.

By this time the socialism of Germany began to be a power, which was calculated to excite grave alarm among the ruling classes. The social democrats had returned five members to the North German diet in 1867. For the German diet in 1871 they had counted only 120,000 votes, and returned two members; but in 1877 they had returned twelve members and polled nearly half a million. In Berlin the socialist voting strength had risen from 6695 in 1871 to 57,511 in 1878,—an increase which was all the more remarkable that Lassalle could hardly obtain a hearing in the capital when he commenced his career. A much more significant feature of the movement was the admirable state of organization to which the socialist propaganda had attained. A large number of skilful, intelligent, and energetic agitators spread their doctrines throughout Germany; a whole machinery of newspapers, pamphlets, treatises, social gatherings, and even almanacs diffused the new creed. In all the great centres of population, in Berlin, Hamburg, and the industrial towns in Saxony and on the Rhine, the socialists were rapidly tending to become the strongest party. The Government accordingly intervened with exceptional legislation, which in 1878 was carried during the excitement occasioned by the attempts on the emperor's life of Hodel and Nobeling. These exceptional laws, though administered with great rigour, have not by any means succeeded in arresting the progress of the movement, as at the election to the Reichstag in 1884 the socialists polled about 600,000 votes and returned twenty-four members. Berlin alone counted 68,000 socialist voters. In the last report relating to the anti-socialist law laid before the Reichstag (1885) the continued progress of the party is admitted.

Catholic socialism of Germany.

The participation of the Catholic Church of Germany in the social question dates from the period of the Lassalle agitation. In 1863 Döllinger recommended that the church should intervene in the movement, and Bishop von Ketteler of Mainz lost no time in expressing sympathy with Lassalle. In a treatise entitled *Die Arbeiterfrage und das Christenthum* (1864) Ketteler criticizes the liberalism of the Manchester school in substantially the same terms as Lassalle, and recommends the voluntary formation of productive associations with capital supplied by the faithful. In 1868 the Catholic socialism of Germany took a more practical form; it started an organ of its own and began to organize unions for the elevation of the working men. The principles of the movement have been with some precision expounded by Canon Moufang in an electoral address at Mainz (1871), and by the writers in their organ. All agree in condemning the principles of liberalism, especially in its economic aspects, as destructive of society and pernicious to the working-man, who, under the pretence of freedom, is exposed to all the precariousness and anarchy of competition and sacrificed to the iron law of wages. Self-help as practised in the Schulze-Delitzsch schemes is also considered to be no sure way of deliverance. This general remedy is union on Catholic principles, especially the formation of trade guilds suited to modern exigencies, which some of their leaders would make a compulsory measure enforced by the state. The views of Moufang, which are most definite, may be thus summarized: legal protection for the workers, especially as regards hours of labour, wages, the labour of women and children, sanitation; subventions for workmen's productive associations; lightening of taxes on labour; control of the moneyed and speculating interests. In the organization of unions the success of Catholic socialism has been great; and the social democrats admit that they can make no progress in Catholic districts where the church has developed its social activity.

Protestant socialism.

The socialist activity of the Protestant Church of Germany dates from 1878. The most important literary product of

the movement is a work by Pastor Todt entitled *Der radikale deutsche Socialismus und die christliche Gesellschaft* In this work Todt condemns the economics of liberalism as unchristian, and seeks to show that the ideals of liberty, equality, and fraternity are entirely Scriptural, as are also the socialist demands for the abolition of private property and of the wage system, that the labourer should have the full produce of his labour, and that labour should be associated The chief leader of the movement is the court preacher Stocker, the head also of the anti-Semitic agitation, which is largely traceable to economic causes Stocker founded two associations,—a central union for social reform, consisting of members of the middle classes interested in the emancipation of labour, and a Christian social working-men's party The former has had considerable success, especially among the Lutheran clergy The movement has met with the most strenuous resistance from the social democratic party and has been greatly hampered by the anti-socialist law of 1878

State socialism

Little can here be said of the state socialism of Bismarck,—a very recent movement, which has not yet had time to pass into history Its leading principles were announced in an imperial message to the Reichstag in November 1881 Besides the repressive measures necessary to restrain the excesses of the social democracy, the emperor declared that the healing of social evils was to be sought in positive measures for the good of the working man The measures proposed were for the insurance of the workmen against accident, sickness, old age, and inability to work by arrangements under state control "The finding of the right ways and means for this state protection of the working man is a difficult task, but also one of the highest that concern every society standing on the ethical foundations of the Christian national life" The message then proceeds to speak of measures for "organizing the life of the people in the form of corporative associations under the protection and furtherance of the state,"—a clause which might be taken as an admission of the collectivist principle As yet the imperial programme has only been partially realized It will be obvious that such measures can be rightly appreciated only with reference to the general theory and practice of Prussian government

Anarchism of Bakunin

The acknowledged father of anarchism is PROUDHON (*q v*), but the doctrine owes its development chiefly to Russian thinkers who had been trained in the Hegelian left The great apostle of the system in its advanced and most characteristic stage was Michael Bakunin Bakunin was sprung from the highest Russian aristocracy, and was born at Torshok, in the government of Tver, in 1814 Leaving the army, in which he served for some time, he visited western Europe, chiefly Paris, where he met George Sand and Proudhon in 1847 For his share in the German disturbances of 1849 he was imprisoned in Russia for several years and then sent to Siberia, from which he escaped, and spent the rest of his life in exile in western Europe, principally in Switzerland In 1869 he founded the Social Democratic Alliance, which, however, dissolved in the same year and entered the International In 1870 he attempted a rising at Lyons on the principles afterwards exemplified by the Paris commune At The Hague congress of the International in 1872 he was outvoted and expelled by the Marx party Bakunin's activity was most remarkable as an agitator The international socialism of the Romance countries, especially that of Spain and Italy, has been largely moulded by him. He died at Bern in 1876 Nothing can be clearer or more frank and comprehensive in its destructiveness than the socialism of Bakunin It is revolutionary socialism based on materialism and aiming at the destruction of external authority by every available means He rejects all the ideal systems in every name and shape, from the idea of God downwards, and he rejects every form of external authority, whether emanating from the will of a sovereign or from universal suffrage "The liberty of man," he says in his *Dieu et L'État*, "consists solely in this, that he obey the laws of nature, because he has himself recognized them as such, and not because they have been imposed upon him externally by any foreign will whatsoever, human or divine, collective or individual" In this way will the whole problem of freedom be solved that natural laws be ascertained by scientific discovery, and the knowledge of them be universally diffused among the masses Natural laws being thus recognized by every man for himself, he cannot but obey them, for they are the laws also of his own nature, and the need for political organization, administration, and legislation will at once disappear Nor will he admit of any privileged position or class, for "it is the peculiarity of privilege and of every privileged position to kill the intellect and heart of man The privileged man, whether he be privileged politically or economically, is a man depraved in intellect and heart" "In a word, we object to all legislation, all authority, and all influence, privileged, patented, official, and legal, even when it has proceeded from universal suffrage, convinced that it must always turn to the profit of a dominating and exploiting minority, against the interests of the immense majority enslaved" The anarchy of Bakunin is therefore essentially the same as that of Proudhon, but expressed without paradox, and with a destructive revolutionary energy which has seldom been equalled in history What they both contemplate is a condition of human enlightenment and self-control in which the individual shall be a law to himself, and in which all external authority shall be abolished as a despotic interference with personal freedom It is an ideal to which the highest religion and philosophy look forward as the goal of man, not as one, however, which can be forthwith reached through the wholesale destruction of the present framework of society, but through a long process of ethical and social improvement The error of the anarchists consists in their impatient insistence on this proclamation of absolute freedom in the present debased condition of the great mass of the people in every class They insist on taking the last step in social development before they have quite taken the first The other leading principles of anarchism will be best understood from the following extracts taken from the programme of the International Social Democratic Alliance The Alliance demands above all things the definitive and complete abolition of classes, and political, economic, and social equality of individuals and sexes, and abolition of inheritance, so that in the future every man may enjoy a like share in the produce of labour, that land and soil, instruments of labour, and all other capital, becoming the common property of the whole society, may be used only by the workers, that is, by associations of cultivators and industrialists It looks forward to the final solution of the social question through the universal and international solidarity of the workers of all countries, and condemns every policy grounded on so-called patriotism and national jealousy It demands the universal federation of all local associations through the principle of freedom. Bakunin's methods of realizing his revolutionary programme are not less frank and destructive than his principles The revolutionist, as he would recommend him to be, is a consecrated man, who will allow no private interests or feelings, and no scruples of religion, patriotism, or morality, to turn him aside from his mission, the aim of which is by all available means to overturn the existing society His work is merciless and universal

destruction. The future organization will doubtless proceed out of the movement and life of the people, but it is the concern of coming generations. In the meantime all that Bakunin enables us to see as promise of future reconstruction is the free federation of free associations,—associations of which we find the type in the Russian commune.

Bakunin, as we have seen, has had great influence on the socialism of the Romance countries. The important risings in Spain in 1873 were due to his activity; and the socialism of Italy has been largely inspired by him. In those countries, as well as in France and French Switzerland, anarchist doctrines of the same general type as that of Bakunin are still in vogue, and are advocated by men of mark in literature and science like Kropotkine and Elisee Reclus. The views of the propaganda which they represent were most clearly and distinctly brought out during the great anarchist trial at Lyons in 1883. What they aim at is the most absolute freedom, the most complete satisfaction of human wants, without other limit than the impossibilities of nature and the wants of their neighbours equally worthy of respect. They object to all authority and all government on principle, and in all human relations would in place of legal and administrative control substitute free contract, perpetually subject to revision and cancelment. But, as no freedom is possible in a society where capital is monopolized by a diminishing minority, they believe that capital, the common inheritance of humanity, since it is the fruit of the co-operation of past and present generations, ought to be at the disposal of all, so that no man be excluded from it, and no man seize part of it to the detriment of the rest. In a word, they wish equality, equality of fact, as corollary or rather as primordial condition of freedom. From each one according to his faculties; to each one according to his needs. They demand bread for all, science for all, work for all; for all, too, independence and justice. Even a government based on universal suffrage gives them no scope for effective action in the deliverance of the poor, as they maintain that of the eight million electors of France only some half a million are in a position to give a free vote. In such a state of affairs, and in view of the continued misery and degradation of the proletariat, they proclaim the sacred right of insurrection as the *ultima ratio servorum*.

French anarchism.

Russian nihilism.

It is an interesting fact that socialism has taken its most aggressive form in that European country whose civilization is most recent. The revolutionary opinions of Russia are not the growth of the soil, and are not the natural and normal outcome of its own social development; they have been imported from abroad. Falling on youthful and enthusiastic temperaments which had not previously been inoculated with the principle of innovation, the new ideas have broken forth with an irrepressible and uncompromising vigour which has astonished the older nations of Europe. Another peculiarity of the situation is that the Government is an autocracy served or controlled by a camarilla largely foreign both in origin and sympathy. In this case, then, we have a revolutionary party inspired by the socialism of western Europe fighting against a Government which is also in many ways an exotic and is not rooted in the mass of the people. The chief support of the Government is to be found in the reverence of the peasantry for the person and office of the czar, while the nihilists look upon the communal institutions of the country as their great ground of hope. Considered as a national movement, three distinct stages are recognized in the phenomena called Russian nihilism. In its first stage it was a speculative and anti-religious tendency, destructive of all orthodox tradition and authority. It was the spirit of the Hegelian left frankly accepting the materialism of Buchner and Moleschott as the final deliverance of philosophy; and the time was the early years of Alexander II., when the old despotic restraints were so largely removed,—a period of reform and innovation and comparative freedom. In a country where religion had little influence among the educated classes, and where philosophy was not a slow and gradual growth of the native mind, but a fashion imported from abroad, the most destructive materialism found an easy conquest. It was the prevalent form among the advanced thinkers; it was clear, simple, and thorough; and it suited well the anti-religious mood of the time. By the side of this negative speculation, however, the Russian youth became aware of a new creed, destructive also in its beginnings, but full of the positive promise of future reconstruction and regeneration,—socialism. Here they saw the struggle of the proletariat, so terribly conspicuous in the Paris commune, which attracted universal attention in 1871, a proletariat represented in Russia by a nation of peasantry sunk in immemorial ignorance and wretchedness. At this period hundreds of young Russians of both sexes were studying in western Europe, especially in Switzerland. In 1873 they were by an imperial ukaze recalled home, but they carried the new ideas with them. The period of speculation was succeeded by a period of socialist propaganda, which naturally met with implacable opposition and merciless repression from the Government. As they received no mercy, the nihilists determined to show none; and in 1878 began the terrible duel of the Russian revolutionists against the autocracy and its servants, which culminated in the violent death of Alexander II. in 1881.

How far we are to regard the revolutionary movement of Russia as cognate in principle with anarchism is not easy to determine. In despotic countries, where constitutional reform and opposition to government are not tolerated, resolute innovators are naturally driven to secret conspiracy and to violent action. What distinguishes the Russian revolutionary party from other movements of a like nature is the intensity of the enthusiastic devotion and self-sacrifice with which they have braved death, imprisonment, exile, and privation in every form and the calculating skill with which they have called the resources of modern chemistry to their aid. There is no doubt that the doctrines of men like Bakunin have had great influence on Russian socialism; but so have the writings of Marx, as also of J. S. Mill and other advanced thinkers, who have no connexion with anarchism. It is certain that the leaders of the revolutionary party resorted to violent measures only after their peaceful propaganda was being ruthlessly suppressed. With regard to political reform many of their leaders have declared that they would be satisfied with constitutionalism. In the address sent to the emperor Alexander III. after the death of his father in March 1881, the executive committee of the revolutionary party offered to submit unconditionally to a national assembly duly elected by the people. In this recognition of constitutionalism, as well as in the strongly centralized organization of their executive, the Russian revolutionary party are essentially at variance with anarchism. In economics they advocate a thoroughgoing collectivism.

Classification of schools of socialism.

We have now given a brief outline of the various forms of socialism as they have historically appeared. It may be useful to group them as accurately and clearly as possible. (1) Experiments in socialism conducted by private initiative, as carried on in the schools of Saint-Simon, Fourier, and Owen; not that they objected to state help, but that, in point of fact, their efforts were conducted by private means. (2) Productive associations with state help; the programme of economic change favoured by Louis Blanc and Lassalle. (3) The Marx school of socialism, scientific and revolutionary, beyond all comparison the most im-

portant and most influential of all forms of socialism (4) Anarchism (5) Nihilism (6) Christian socialism, inasmuch as the various phases of Christian socialism condemn the principle of competition as operating in modern industry, and favour the organization of labour on united principles, and especially of productive associations with a common capital and an equitable system of distribution, they must be regarded as true forms of socialism (7) To these should be added the speculative socialism of which Rodbertus is the most remarkable example, recognizing the fundamental evils of the present system and agreeing with the Marx school in holding that socialism is the next stage in social evolution, Rodbertus believed that the period of its realization is so remote that any decidedly practical effort towards that end is inapplicable, hence he could only recommend transitional remedial measures, which will at least circumscribe the mischief inherent in the present economic order and also pave the way towards a better state (8) And last of all may be added the various forms of state socialism, which are all examples of state action on behalf of the poor, especially of the use of the public resources for that purpose The word "socialism" is very frequently used in this sense As the continued use of the word in such a way is almost a certainty, this phase of the subject must be recognized here It may be described as socialistic inasmuch as it fully admits the responsibility of society for all its members, but in many respects its tendencies are opposed to true socialism It is a vague movement which has not yet had time to take shape, and cannot be discussed here "Socialism of the chair" has already been discussed under POLITICAL ECONOMY, vol xix p 393.

The above classification can of course pretend only to be a rough and general one The various heads of the classification are not exclusive The first variety has chiefly an historical interest The American communities (discussed under COMMUNISM) are really cases of the old crude communism Productive associations with state help stand on the Gotha programme of the social democrats of Germany They are recommended by Christian socialists, both Catholic and Protestant, and they form an important item in the programme of the "knights of labour" of America The resemblance in type between the "community" of Owen, the *phalange* of Fourier, the *mir* or commune of Russia, and the free commune of Bakunin is apparent It is the social unit as determined by obvious economic, local, and historical conditions, and in socialism naturally becomes the point of departure for a new construction of society It will have been noted that most of the important phases of socialism have been and are international in sympathy and activity The Marx socialism is spreading in nearly every country of the civilized world, the doctrine being diffused by energetic agitators, and not seldom by men of philosophic and literary culture In late years this is true both of France and England It is well known how active anarchism has been The Christian socialist movement is more or less operative in Belgium, France, Germany, Austria, and to some extent in England

In this article our aim has been to give an expository and historical account of the various phases of socialism It is impossible even to refer to all the different questions suggested in our sketch, and to discuss the relations of antagonism and affinity between socialism and the prevailing social and economic ideas and institutions would require a long and elaborate treatise In the course of the article many obvious points of relationship, and particularly of contrast, between socialism and political economy have presented themselves All that we can now do is to emphasize a few of the more important of these The scope of the current political economy of Great Britain may be broadly defined as follows —given the existing arrangements with regard to land, capital, and labour, to determine the economic phenomena and the economic laws that will prevail under a system of free individual competition As we have abundantly seen, socialism is diametrically opposed to the permanent continuance of these arrangements It looks forward to the time when the present system of individual property in land and capital served by wage-labour will pass away, and when free competition on that basis will cease with the system of which it is a part It regards the present economic order with the laws and conditions peculiar to it as a passing phase in the historic evolution of mankind, with no greater claim to permanence or finality than other historic eras which have had their day What enlightened socialism above all demands is that an unprejudiced science should endeavour to distinguish between such economic laws as are permanently grounded in the nature of man and his environment and such as have their validity only in the existing economic order, between such as are enduringly founded on nature and such as are only the accidents or temporary manifestations of a changing civilization Socialists appeal to history to prove that what the orthodox economy considered the natural and normal order of things, with its distribution of wealth under the three categories of rent, profit, and wages, is really an exceptional phenomenon limited both in extent and duration It is therefore an obvious error to speak of socialism as roundly controverting economic law It is no business of socialism to controvert a law grounded in nature, such as the physiological basis of the law of population, but it denies the applicability of the Malthusian precept under the present condition, when wealth is superabundant, but badly distributed owing to causes for which neither nature nor science, but human selfishness and ignorance are responsible Nor does it lie in the principles of socialism to question the validity of those special economic laws that hold good under the present economic order Some of these, such as the iron law of wages, socialism is disposed rather to accentuate unduly as a necessity of the present system It is the aim of socialism to abolish the conditions under which such laws have their validity Socialists object to the present economic order *because* of the necessity of results which are opposed to human wellbeing They object entirely to the existing order with its distribution of the produce of labour into the three categories of rent, profit, and wages, because on it are founded class distinctions, with the consequent antagonism of classes, and the subjection and degradation of the lower classes,—holding that economic subjection involves all other forms of subjection and degradation In short, scientific socialism as represented by Marx and Friedrich Engels appeals against the existing economic order, of which the orthodox political economy is an exposition and for which it is so frequently an apology, to the higher laws and principles of social evolution as determined by the nature of man in relation to the environment in which he lives and develops

Relation to political economy

There is no space here to trace historically the influence of political economy in the genesis of socialism, nor that of socialism on the recent political economy It has naturally been the tendency of socialism to emphasize the idea of the worth and significance of labour, so prominent in the school of Adam Smith This was one of the most valuable features of the Saint-Simon school, otherwise so much disfigured with utopianism and extravagance As we have seen, the socialism of Marx is in some of its most important aspects a development of Ricardian principles Turning to the influence of socialism on political economists, we need but refer to that exercised by French socialism

on J S Mill, as described in his *Autobiography* The economics of Germany has for the last fifteen years been most powerfully affected by the theories of Lassalle, Marx, and latterly also of Rodbertus The causes which have produced socialism have also affected economics, but a large part of the change is due directly to the teaching of the socialists, especially of Marx, whose great work is recognized as of the first importance Without commanding assent to its leading conclusions, socialism has given a new direction to most of the recent Continental research in political economy The German "socialism of the chair," the influence of which is by no means confined to the country that produced it, is sufficient evidence of this

Relation to Darwinism

As we have already seen, Marx and his school accept in the completest form the doctrine of evolution, which they learned first in Hegel, but finally hold as taught by Darwin, and, in common with most socialists, from Saint-Simon downwards, they recognize three stages in the economic development of society,—slavery, serfdom, and wage-labour, —which last they believe will be displaced by an era of associated labour with a collective capital But how, it is asked, does this theory of socialism as the next goal of society consist with the Darwinian doctrine of the struggle for existence and the survival of the fittest? Is not competition, this *bête noire* of the socialists, simply the social and economic form of the struggle for existence? Is not competition, therefore, the very condition of social progress? Is not socialism, therefore, inconsistent with progress? The question suggested is a large and complicated one, to which we cannot here pretend to give an exhaustive or determinate answer, but can only indicate some of the main lines of discussion (1) In all periods of human development, and especially in its higher stages, progress consists most essentially in a growing social and ethical virtue and in the cultivation of the beautiful both in sentiment and art With such an enlarging ideal of progress, how harmonize a system of competition like the present, by which millions in every great European country are effectively deprived of the means of development, and even of bare livelihood? The struggle for existence has always been modified by social and ethical conditions If it is to continue, as it will in various forms, it should be carried on under higher conditions, suitable to a higher and less animal stage in the evolution of man (2) Human progress has undoubtedly been attained through struggle, especially through the struggle for existence, but the struggle has essentially been one of men united in society, of tribe against tribe, of city against city, of nation against nation, and race against race Thus it is easy to exaggerate unduly the importance of the struggle of the individual man History has only too often seen the abnormal development of private selfishness, so overgrown as to weaken, and finally dissolve and overthrow, the society in which it acted, thereby accomplishing its own destruction This is indeed the open secret of the ruin of most of the communities that have existed In short, a happy and healthy individual development can be secured only through its due subordination to social virtue and the general welfare Human progress has been by strong societies with a well-developed social and public virtue The excessive development of "individualism" within a society has been its weakness and ruin (3) While emphasizing the extreme importance of the hereditary principle, especially as connected with the fundamental institution of the family, we should also recognize its tendency to abuse in perpetuating the enormous inequalities of property and condition, many of which originated in a less perfect system of society The hereditary principle has indeed greatly contributed to the solidity and continuity of the social order, but it also gives an exceptional advantage in the struggle for existence to the privileged few In this point, therefore, the present system does not best fulfil the requirements of the evolution theory as applied to society The struggle is not one of merit It is frequently one of merit against hereditary privilege, not seldom it is one of privilege against privilege without regard to merit at all (4) In considering the possibilities of human progress afforded by the present system of society in the light of the evolution theory, it is impossible to ignore the fact that the continuance of the race depends most on the less fit members of society, on the lower strata, which are thriftless, the worst fed, and worst educated While the classes which are most intelligent and endowed with self-control abstain from marriage or defer it, those who have the lowest organization marry early and have large families Even to perpetuate disease and deformity is not considered wrong It may be that prohibitory and restrictive laws, even if passed, would prove inoperative and ineffectual in restraining so many hasty and ill-considered unions that only serve to multiply misery and disease, but it is surely excusable at least to inquire whether this abuse of freedom could not be curtailed by strengthening the social union and increasing the pressure of the enlightenment and moral sense of the community (5) Above all, as the tendency of the present order is to give the victory to cheapness, it may be asked whether competition,—the economic form of the struggle for existence—is really such a sure and potent element of progress, unless most powerfully counteracted by other principles? In short, history is the resultant of many complex forces, and it is easy to push too far the formulæ of any system It is out of the balance and harmony of many principles, of which the struggle for existence is but one, that human progress can proceed (6) The main point is that in social evolution the widest phase of the struggle for existence is between forms of social organization Hence the great question as regards socialism is whether it is the fittest form of social organization for the time coming? Is it best adapted to carry forward and develop in wider and more adequate form the progressive life of the future?

Marriage and family

While many socialists have announced lax views regarding marriage and the family, it cannot in view of popular misunderstanding be sufficiently emphasized that the essence of socialism is an economic change It enunciates no special doctrine on the relation of the sexes In common with other social reformers, socialists generally advocate the equality of the sexes and the emancipation of women, they object to the mercenary element so common in marriage, and they abhor prostitution as one of the worst and vilest of existing evils, believing, moreover, that it is a necessary result of the present distinction of classes and of the unequal distribution of wealth The views of the anarchists have already been noted In the Marx school there is a tendency to denounce the legally binding contract in marriage But such views all belong to the accidents of socialism

Religion

So with regard to religion Socialism has been and still is very frequently associated with irreligion and atheism The same remark applies to Continental liberalism, and partly for a like reason the absolute Governments of the Continent have taken the existing forms of religion into their service and have repressed religious freedom On religion as on marriage socialism has no special teaching While the anarchists of the school of Bakunin would overturn all forms of religion and reject the idea of God, the social democrats of Germany in their Gotha programme of 1875 declare religion to be a private concern As we have seen, Christian socialism is a considerable force in many European countries, and in many of the other schools, especially that of

Louis Blanc, the kinship and even identity of ethical spirit with that of Christianity are unmistakable

In relation to politics

In their revolutionary impatience the anarchists have avowed their hostility to all the existing political forms except the free commune, which alone will be left standing amid the general wreck they contemplate The Marx school, as represented by its ablest living exponent, Friedrich Engels, also look forward to a period in the evolution of society when the state will become superfluous, and, having no longer any function to perform, will die away The state they regard as an exploiting institution, an organization of the ruling classes for retaining the workers in economic subjection The International was an attempt to supersede the exploiting states by a combination of the workers of all countries without distinction of creed, colour, or nationality When the workers in the name of the whole society seize political power and take over the control of production, the rule of classes, their conflicts and the excesses of the struggle for existence among them, will cease Instead of a government over persons we shall have an administration of things and the control of productive processes Obviously the Marx school reserve the realization of this idea till the evolution of society has prepared the way for it In the conduct of the International they insisted on a strongly centralized form of organization as against the free federalism and the rejection of all authority maintained by Bakunin and his followers This opposition between centralization and federalism does not concern us here, it is a question common to theoretical and practical politics It is necessary, however, to say a word about the opposition between the national tendency of the Lassalle school and the international socialism of Marx As we have seen, a compromise was effected in the Gotha programme of 1875, in which the importance of the nation as an existing form of human society is amply recognized The question is still discussed in the organs of the social democrats, but the international tendency is decidedly the prevalent one "Want of patriotism" is one of the current epithets of reproach cast at them It is needless to point out that as most new movements of importance have been revolutionary, so also have they for good or evil been international In becoming international the labour movement has only followed the example set by commerce, finance, diplomacy, religion, philosophy, art, music

Conclusion

We have now reviewed the most important aspects of the socialist movement As we have seen, socialism is a new form of social organization, based on a fundamental change in the economic order of society Socialists believe that the present economic order, in which industry is carried on by private competitive capital, must and ought to pass away, and that the normal economic order of the future will be one with collective means of production and associated labour working for the general good This principle of socialism is cardinal and fundamental All the other theories so often connected with it and so important in relation to religion, philosophy, marriage, patriotism, &c, are with regard to socialism non-essential Questions of method, though supremely important, must also be distinguished from the essential principle At the same time it will be seen that an economic change, such as that contemplated in socialism, would most powerfully affect every other department of human life Socialism, in short, means that in industry, in the economic arrangements of society, the collective or co-operative principle shall become normal or universal, that all who are able should contribute to the service of society, and that all should share in the fruits of the associated labour according to some good and equitable principle In such a condition of things the noblest field for ambition will be in the service of society,—an ideal which is already partially realized in the democratic state It is in this fundamental sense that J S Mill declared himself a socialist[1] It is in this sense also that Albert Schaffle, one of the first living authorities on economics and sociology, has, after long years of study of the subject, come to the conclusion that "the future belongs to the purified socialism"[2]

Scientific socialists strongly insist that this economic order of the future cannot be realized by utopian schemes or arbitrary legislation or mere revolutionary disturbance If it come at all, it must come as the consummation of the dominant tendencies of modern social development, it must be realized under the conditions prescribed by our nature and environment In discussing the doctrines of Marx we stated that the central point of the question was this—do the strongest forces of the social development of our time really tend towards the superseding of the present economic order and towards the establishment of a new and wider order based on collective capital and associated labour? Socialists maintain that they do, and that there is at present going forward a double process of dissolution and reconstruction,—the dissolution of individualism with a constructive tendency towards collectivism From the socialist point of view the following may be signalized as indicative of such a process (1) The tendency towards economic anarchy already explained in treating of Marx's views. Over the whole industrial world we see great crises succeeding each other, resulting in stagnation and depression which now threaten to be chronic and permanent While the productive forces of the world are enormously increasing, they only tend the more to intensify national and international competition, and to render labour superfluous, precarious, and dependent Under this system the worker has neither freedom nor security All this variety of symptoms are only a sign of the break-down of the present economic order both in principle and method They are the necessary results of the competitive system, which has thus finally revealed its real nature and tendency,—economic and social anarchy (2) The constant and inevitable tendency towards concentration in industrial operations, which began with the introduction of steam and of the factory system, through which the small producer has been superseded by the capitalist, the smaller capitalist by the larger And now the single capitalist is being absorbed in the company, a growing proportion of the world's business being so large that only a great company can provide the requisite capital and organization, whilst in the large companies there is a tendency, in case they cannot drive each other out of the field, to bring about a fusion of interests In all this we see a great constructive process inevitably going on as the result of the inherent tendencies of industrial development Thus the control of industry will be concentrated in a few colossal companies and their chiefs It is obvious how this process could simplify the transference of the whole to a collective management by society (3) This leads us to a third important point, the growing tendency towards state control of industry, and the growing sense of the responsibility of society for all its members, observable in German politics, not less than under the more democratic conditions of France and England It is apparent how under this influence the existing state might absorb one by one all the large social functions, as has already happened with regard to education, means of communication, &c. Naturally this could be accomplished only through a most comprehensive development of local and subordinate bodies of every kind Socialism by no means implies that such an enormous burden of

[1] See his *Autobiography*, also his *Pol Economy*, chapter on the probable future of the labouring classes

[2] *Bau und Leben*, vol ii 120

work should be thrown on the central government. Most socialist schools have contemplated a vast increase of communal or local autonomy,—a course which, on the other hand, does not carry with it the subversion of the central government. (4) In England during the last half century we have seen a long succession of efforts, partially successful, towards a new organization of society rendered necessary by the changes due to the industrial revolution. In economics as in other spheres the watchword of the new era has been freedom, the removal of restraint. But it has been found that positive measures of reconstruction were also necessary. Factory legislation carried in opposition to the prevailing economic theory, trades unions, employers' combinations, industrial partnerships, boards of conciliation, the co-operative system,—all these are real, if partial, endeavours towards a new organization of society suited to the new conditions. Socialism claims to be the comprehensive scheme of organization which embraces in a complete and consistent unity all these partial efforts. (5) But the great social force which is destined to work out the vast transformation consists of the human beings most directly interested in the colossal struggle,—the modern democracy. This democracy is marked by a combination of characteristics which are new to history. It is being educated and enlightened in the school and by the cheap press; it is being drilled and organized in large factories, in the national armies, by vast popular demonstrations, in the gigantic electoral struggles of the time. Thus it is becoming conscious of its enormous power, and able to make use of it. It is becoming conscious also of its unsatisfactory social and economic position. The democracy which has become the master-force of the civilized world are economically a mass of proletarians dependent on precarious wage-labour. Having transformed the political condition of things, they are ready now for an economic transformation. But the inevitable process of concentration of industrial operations already referred to is entirely against the continuance or restoration of the small producer, whether workman or peasant proprietor. Such efforts of continuance or restoration are reactionary; they are economically unsound and must fail. Production and distribution ever tend to larger dimensions. The only issue out of the present economic condition is concentrated collective industry under the control of the new democracy and its chosen leaders. On the irresistible momentum of these two inevitable and ever-growing forces—the concentration of industry and the growth of the new democracy—socialism depends for the realization of its scheme of transformation.

Such are the tendencies to which philosophic socialists point as already working towards a transformation of society of the kind they expect. It is essentially a question of the future, with which we have no concern in this article. Our duty has simply been to point out the forces which socialists believe to be actually at work for the realization of their theory of social organization; and here we must leave the subject.

Literature.—The literature of socialism is enormous and rapidly growing; besides those named under the special articles we now give a list of some of the leading works which are in whole or in part devoted to it:—Karl Marx, *Das Kapital* (1st vol., 3d ed., Hamburg, 1883; 2d vol., 1st ed., Hamburg, 1885); Friedrich Engels, *Eugen Duhring's Umwalzung der Wissenschaft*, a controversial work, but containing a remarkably clear and able exposition of the Marx position by its best living exponent (2d ed., Hottingen-Zurich, 1886); Albert Schaffle, *Bau und Leben des socialen Korpers* (Tubingen, 1878; the third vol. of this work supersedes his *Kapitalismus und Socialismus*, Tubingen, 1870), *Quintessenz des Socialismus* (7th ed., Gotha, 1879); Adolf Held, *Sozialismus, Sozial-Demokratie, und Sozial-Politik* (Leipsic, 1878); Von Sybel, *Die Lehren des heutigen Socialismus und Communismus* (Bonn, 1872); Lujo Brentano, *Die christlich-soziale Bewegung in England* (Leipsic, 1883); Von Scheel, *Die Theorie der sozialen Frage* (Jena, 1871); Alphons Thun, *Geschichte der revolutionaren Bewegungen in Russland* (Leipsic, 1883); Rudolf Meyer, *Der Emancipations-kampf des vierten Standes* (2d ed., Berlin, 1882); Franz Mehring, *Die Deutsche Socialdemokratie, ihre Geschichte und ihre Lehre* (Bremen, 1879); Laveleye, *Le Socialisme Contemporain* (2d ed., Paris, 1883); Paul Janet, *Les Origines du Socialisme Contemporain* (Paris, 1883); Paul Leroy-Beaulieu, *Le Collectivisme* (Paris, 1884); *Le Procès des Anarchistes* (Lyons, 1883); John Rae, *Contemporary Socialism* (London, 1884); Stepniak, *Underground Russia* (London, 1883); Hyndman, *Historical Basis of Socialism in England* (London, 1884). See also the relative chapters in Roscher's *Grundlagen der Nationalokonomie*; Adolf Wagner's *Lehrbuch der politischen Oekonomie* (vol. i., *Grundlegung*, 2d ed., Leipsic, 1879); Mill's *Political Economy* and *Autobiography*; and Sidgwick's *Principles of Political Economy*. (T. K.)

SOCIETIES. Under ACADEMY will be found an account of the various bodies of which that word forms part of the titles, usually denoting some kind of state support or patronage. The present article is restricted to scientific, archæological, and literary societies, chiefly those founded and carried on by private collective effort. Certain academies omitted in the previous article are, however, referred to. Governmental, collegiate, and university institutions do not come within our scope, neither as a rule do endowed societies, nor yet institutions which, although they bear the name, carry on no kind of joint literary or scientific work. With a few exceptions here and there, the societies mentioned are still flourishing.

In their modern form learned and literary societies have their origin in the Italian academies of the Renaissance; but private scientific societies have arisen chiefly during the 19th century, being due to the necessity of increased organization of knowledge and the desire among scholars for a common ground to meet and compare results and collect facts for future generalization. These bodies rapidly tend to increase in number and to become more and more specialized. Many efforts have been made from time to time to tabulate and analyse the literature published in their proceedings, as, for instance, in the indexes of Reuss (1801-21) and the Royal Society (1867-79) for physics and natural science, and those of Walther (1845) and Koner (1852-56) for history. A further development of the work done by societies was made in 1822, when, chiefly owing to Humboldt, the *Gesellschaft deutscher Naturforscher und Aerzte* first met at Leipsic. This inauguration of the system of national congresses was followed in 1831 by the *British Association for the Advancement of Science*, which has served as the model for similar societies in France, America, and elsewhere. The merit of introducing the idea of migratory congresses into France is due to the distinguished archæologist, M. Arcisse de Caumont (1802-73), who established the *Association Normande*, which since 1845 has held a reunion in one or other of the towns of the province for the discussion of matters relating to history, archæology, science, and agriculture, with local exhibitions. From the same initiation came the *Congrès Archéologique de France* (1834), which was organized by the *Société Française pour la Conservation des Monuments Historiques*, the *Congrès Scientifique*, which held its first meeting at Caen in 1833 (directed by the *Institut des Provinces*), and the *Congrès des Sociétés Savantes des Départements*, which for many years after 1850 held its annual sittings at Paris. The idea received the sanction of the French Government in 1861, when a *Congrès des Sociétés Savantes* was first convoked at the Sorbonne by the minister of public instruction. In Italy Charles Bonaparte, prince of Canino, started an association with like objects, which held its first meeting at Pisa in 1839. Russia has had an itinerant gathering of naturalists since

1867 International meetings are a natural growth from congresses in which specialists of one country or speech are alone represented Two remarkable examples of these cosmopolitan societies are the *Congrès International d'Archéologie et d'Anthropologie Préhistoriques*, founded at Spezzia in 1865, and the *Congrès International des Orientalistes* (1873) Another step towards more complete organization was taken when the *Smithsonian Institution* (Washington, U S) developed the admirable system of international exchanges of its publications, as well as of other works and specimens, among societies and individuals The *Institution* has agents in every part of the globe, and entertains relations with all the leading societies in the world The *International Scientific Bureau*, a private enterprise, was established at Haarlem by Dr Van Baumhauer to facilitate the sending of parcels among societies and scientific men in Holland Since 1875 the French ministry of public instruction has organized a distribution of foreign publications among societies in France In England local scientific societies are now officially represented at the meetings of the *British Association* In 1883 rules were framed for the admission of corresponding societies and for the institution of a conference of delegates to hold sittings contemporaneously with the annual meeting of the Association, for the purpose of discussing "propositions bearing on the promotion of more systematic observation and plans of operation, and of greater uniformity in the mode of publishing results," as well as for the consideration of "matters in which the co-operation of corresponding societies is desired" A committee was appointed in 1882 at the Montreal meeting of the *American Association for the Advancement of Science* "to confer with committees of foreign associations for the advancement of science with reference to an international convention of scientific associations ," and a fund for the purpose has been started

It has been thought desirable to classify the societies treated of in the present article under the following headings, the first of which includes those of the widest scope, dealing with the whole range of natural history, or with archæology and literature as well as science —I science generally, II mathematics, III astronomy, IV physics, V chemistry, VI geology, mineralogy, and palæontology, VII meteorology, VIII microscopy, IX botany and horticulture, X zoology, XI anthropology, XII sociology (embracing economic science, statistics, law, and education), XIII medicine, surgery, &c, XIV engineering and architecture, XV naval and military science, XVI agriculture and trades, XVII literature, archæology, and history, XVIII geography

I Science generally

United Kingdom —First in antiquity and dignity among English societies comes the Royal Society (*q v*) of London, which dates from 1660 In 1683 William Molyneux, the author of *The Case of Ireland Stated*, excited himself to form a society in Dublin after the pattern of that of London In consequence of his efforts and labours the *Dublin Philosophical Society* was established in January 1684, with Sir William Petty as first president The members subsequently acquired a botanic garden, a laboratory, and a museum, and placed themselves in communication with the Royal Society of London. Their meetings after 1686 were few and irregular, and came to an end at the commencement of hostilities between James II and William III The society was reorganized in 1693 at Trinity College, Dublin, where meetings took place during several years On 25th June 1731, chiefly owing to the exertions of Dr S M Madden, the *Dublin Society for Improving Husbandry, Manufactures, and other Useful Arts* came into existence In January 1737 they commenced to publish the *Dublin Society's Weekly Observations*, and in 1746 the society was placed on the civil establishment, with an allowance of £500 a year from the Government A charter of incorporation was granted in 1750, and seven years later the *Royal Dublin Society* for the first time owned a house of its own, and in the following year began the drawing school, which subsequently did so much for Irish art Between 1761 and 1767 Government grants to the amount of £42,000 for promoting national agriculture and manufactures were distributed by the society, which claims to be the oldest scientific body in the United Kingdom after the Royal Society of London It has published *Transactions* (1799-1810), and its *Proceedings* (1764-75, 1848, &c) and *Journal* (1858, &c) are still issued For the *Royal Irish Academy*, see Academy

The *Royal Physical Society of Edinburgh* was instituted in 1771, and incorporated in 1788, it is exclusively devoted to natural history and the physical sciences With it have been merged many other societies, such as the *Chirurgo-Medical* in 1796, the *American Physical* in 1796, the *Hibernian Medical* in 1799, the *Chemical* in 1803, the *Natural History* in 1812 (which brought in Brougham and Mackintosh), and the *Didactic* in 1813 It issues *Proceedings* (1858, &c) From the *Philosophical Society of Edinburgh* (1739) was developed the *Royal Society of Edinburgh*, whose charter is dated 29th March 1783 It was to comprise a physical and a literary class, among the members of the latter were Robertson, Hume, Burke, and Reid, and among those of the former Hutton, Black, Playfair, Dugald Stewart, and Watt The literary division has been much less productive than the other A second charter was obtained in 1811 The society has published *Transactions* (4to, 1788, &c) and *Proceedings* (8vo, 1845, &c)

The *Linnean Society* for the promotion of zoology and botany was founded in 1788 by Dr (afterwards Sir) J E Smith, in order to supplement the work of the Royal Society, and obtained a royal charter in 1802 The herbarium and collections of Linnæus, with the founder's additions, were purchased after his death It removed from Sir Joseph Banks's old house in Soho Square to Burlington House (London) in 1857, and assumed the apartments it now occupies in 1873 It has published *Proceedings* (1849, &c) The *Journal* (8vo, 1857, &c) and the *Transactions* (4to, 1791, &c) are divided into zoological and botanical sections The *Society for the Encouragement of Arts, Commerce, and Manufactures* took its origin in 1753 from an academy established in the Strand by the landscape painter William Shipley Attention was paid to the application of science to practical purposes, a subject passed over by the Royal Society Exhibitions of pictures by native artists were held, and the first exhibition of the Royal Academy took place in its rooms A fresh start in a new career was made by the *Society of Arts* in 1847, when it obtained a charter and the presidency of the Prince Consort The International Exhibition of 1851 sprang from the smaller exhibitions previously held in its rooms The East Indian section dates from 1869, the foreign and colonial and the chemical sections from 1874 Its organs have been *Transactions* (1783-1849) and the *Journal* (1853, &c) Sir Joseph Banks, Count Rumford, and other fellows of the Royal Society started the *Royal Institution* in 1799, when a site was purchased in Albemarle Street for "an establishment in London for diffusing the knowledge of useful mechanical improvements," to "teach the application of science to the useful purposes of life" The institution was incorporated in the following year One of the most important epochs in the history of chemistry must be dated from the establishment of the laboratory where Davy and Faraday pursued their investigations Belonging to the institution are foundations for professorships in natural philosophy, chemistry, and physiology Courses of lectures on special subjects are given as well as discourses (once a week) of a more general and literary character Its *Journal* has been issued since 1802 The *London Institution* was established on a similar basis in 1805 and incorporated in 1807 The building in Finsbury Circus was erected in 1819 The *British Association for the Advancement of Science* was instituted at York on 27th September 1831 in imitation of the itinerant scientific parliament held in Germany since 1822 (already referred to), and arose from a proposal by Sir D Brewster A meeting is held annually in one of the chief provincial towns of the United Kingdom The object of the association is to promote science, to direct general attention to scientific matters, and to facilitate intercourse between scientific workers Abstracts of the proceedings and reports of committees are published in the annual *Report* (1833, &c) The *Historical Society of Science* (1841) printed a couple of volumes, and the *Ray Society* (1844), instituted for the printing of original and scarce old works (38 vols have appeared) in zoology and botany, still flourishes The *Royal Colonial Institute* was founded in 1868 and incorporated in 1882 It provides a place of meeting for gentlemen connected with the colonies and British India, undertakes investigations into subjects relating to the British empire, has established a museum and library, and gives lectures in its new building in Northumberland Avenue (London). It has published *Proceedings* since 1870 The *Victoria Institute*, or *Philosophical Society of Great Britain*, was founded in 1865 to form a connecting bond between men of science and others engaged in investigating important questions of philosophy and science, more especially those bearing upon the truths revealed in Holy Scripture Its organ is the *Journal* (1867, &c) The *Balloon Society* of Great Britain (1880) is not restricted to aeronautics, but deals with recent discoveries and inventions, and science generally The foundation in 1821 of the *Society for the Encouragement of the Useful Arts in Scotland*, now usually known as the *Royal Scottish Society of Arts*, for the promotion of the useful

arts and such branches of science as bear upon them was due to Sir D Brewster, Sir J Mackintosh, and others; it was incorporated in 1841, and has published *Transactions* since that year

The leading provincial societies of Great Britain of a general character are as follows Aberdeen, *Nat Hist Soc* (1863), *Trans*, *Phil Soc* (1840) Alloa, *Soc of Nat Hist and Arch* (1863), *Proc* (1865, &c) *Banffshire Field Club and Sc Soc* (1880), *Proc* Bath, *Nat Hist and Antiq Field Club* (1866), *Proc* (1867, &c) *Bedfordshire Nat Hist Soc* (1875), *Trans* Belfast, *Nat Hist and Phil Soc* (1821), *Proc* (1852, &c), *Naturalists Field Club* (1863), *Proc* (1875, &c) *Berwickshire Naturalists Club* (1831), *Proc* (1834, &c) Birkenhead, *Lit and Sc Soc* (1857) Birmingham, *Nat Hist and Micr Soc* (1858), *Proc* (1869, &c), *Birmingham and Midland Institute Sc Soc* (1870), *Trans* of archæological section (1871, &c), *Phil Soc* (1876), has a fund for promotion of original research, *Proc*, *Midland Union of Nat Hist Societies* (1877), *Midland Naturalist* Bolton, *Lit and Phil Soc* (1871) Bradford, *Phil Soc* (1865), with various local societies affiliated to it Brighton, *Brighton and Sussex Nat Hist Soc* (1854), *Ann Reports* (1855, &c) Bristol, *Museum and Library* (formed by the amalgamation of the *Institution for the Advancement of Sc, Lit, and the Fine Arts* with the *Lit Soc*, founded 1772), *Naturalists Soc* (1862), *Proc* (1866, &c) Burnley, *Lit and Sc Club* (1873), *Trans* Burton on-Trent, *Nat Hist and Arch Soc* (1876) Cambridge, *Phil Soc* (1819, incorporated 1832), for the promotion of philosophy and natural science, owns museum and library, *Proc* (1865, &c), *Trans* (1821, &c) Cardiff, *Naturalists Soc* (1867), *Trans* Chester, *Soc of Nat Sc* (1871), *Proc* Cork, *Royal Inst* (1807), library, *Cuvierian and Arch Soc* (1836) *Cornwall Royal Inst*, at Truro (1818), devoted to natural philosophy, natural history, and antiquities, *Journal* (1864, &c), *Royal Polytechnic Soc*, at Falmouth (1833, founded by the daughters of R W Fox and others), for the encouragement of science and the fine and industrial arts, *Trans* (1835, &c) *Cumberland Assoc for the Advancement of Lit and Sc* (1876), provides a means of union for the local scientific societies of Cumberland and Westmoreland, *Trans* *Derry Nat Hist and Phil Soc* (1870) *Devonshire Assoc for the Advancement of Sc* (1862) *Dorset Nat Hist and Antiq Club* (1875) *Dumfriesshire and Galloway Sc, Nat Hist, and Antiq Soc* (1876), *Trans* Dundee, *Naturalists Soc* (1873) Eastbourne, *Nat Hist Soc* (1867), *Proc* (1869, &c) *East of Scotland Union of Naturalists' Societies* (1884), *Trans* Ebbw Vale, *Lit and Sc Inst* (1850), owns laboratory Elgin, *Elgin and Morayshire Lit and Sc Assoc* (1836) *Essex Field Club* (1880), at Buckhurst Hill, *Trans* Exeter, *Naturalists' Club and Arch Assoc* (1862) Glasgow, *Phil Soc* (1802), *Proc* (1844, &c), *Nat Hist Soc* (1851), *Proc* (1868, &c), *Soc of Field Naturalists* (1872), *Trans* (1872, &c) Gloucester, *Lit and Sc Assoc* (1838) Greenock, *Phil Soc* (1861) Halifax, *Phil and Lit Soc* (1830), museum and library Hereford, *Woolhope Naturalists' Field Club*, *Hereford Pomona* and *Trans* (1866, &c) *Hertfordshire Nat Hist Soc and Field Club*, formed in 1879 from the *Watford Nat Hist Soc* (1875), *Trans* High Wycombe, *Nat Hist Soc* (1865), *Magazine* (1866, &c) Hull, *Lit and Phil Soc* (1822), *Trans* (1824, &c) Inverness, *Sc Soc and Field Club* (1875) *Isle of Wight Phil and Sc Soc* (1850) *Kent (East) Nat Hist Soc*, at Canterbury (1858), *Trans* Leeds, *Phil and Lit Soc* (1820), *Naturalists' Club* (1870), *Trans* Leicester, *Lit and Phil Soc* (1837), *Trans* Lewes, *Lewes and East Sussex Nat Hist Soc* (1864) Liverpool, *Lit and Phil Soc* (1812, united with *Nat Hist Soc* in 1844), *Proc* (1845, &c), *Philomathic Soc* (1825), *Trans*, *Polytechnic Soc* (1838), *Journal* (1838, United States —The first scientific society in the United States originated from a *Proposal for Promoting Useful Knowledge among the British Plantations*, issued by Dr Franklin in 1743 In the following year the *American Philosophical Society* was founded at Philadelphia, with Thomas Hopkinson as president and Franklin as secretary With it was united on 2d January 1769 another Philadelphia society, *The Junto* (1758), the records of which have been preserved The *American Philosophical Society* is still in vigorous life, and is an exclusively scientific body and the oldest organized society in the United States for the pursuit of philosophical investigation in its broadest sense It publishes *Transactions* (4to, 1771, &c) and *Proceedings* (8vo, 1840, &c) Although not a society in the exact sense of the word, the *Smithsonian Institution*, the most important scientific body in America, must not be overlooked It was founded at Washington by James Lewis Macie, afterwards called Smithson, a natural son of Hugh Smithson, duke of Northumberland He died in 1829, leaving by will a sum of money which in 1838 amounted to over half a million dollars, "to found at Washington, under the name of the Smithsonian Institution, an establishment for the increase and diffusion of knowledge among men" The institution was established by Act of Congress in 1838 The endowment has now been increased to half as much again as the original bequest The National Museum, founded in 1842, the nucleus of which was the natural history collections brought home by the Wilkes and other exploring expeditions, was given into the custody of the Smithsonian Institution in 1858 It has since been largely increased and is now particularly rich in the ethnology, zoology, and mineralogy of the United States The chief function of the institution is to assist scientific research and to act as an organized centre for the exchange of books and specimens with scientific bodies and individuals throughout the whole world The *Annual Reports* date from 1846 (8vo, 1847, &c), the *Smithsonian Contributions to Knowledge* (4to) from 1848, and the *Miscellaneous Collections* from 1856 (8vo, 1862, &c) The *Proceedings* and *Bulletin* (1875, &c) of the National Museum are issued under the authority of the Smithsonian Institution, as well as the publications of the Bureau of Ethnology and the *Bulletin of the Philosophical Society of Washington* Second in point of date comes the *American Academy of Arts and Sciences* of Boston, incorporated in 1780 with the object of furthering the study of the antiquities and natural history of the country Its *Memoirs* (4to, 1785, &c) and *Proceedings* (8vo, 1848, &c) are still published The *Connecticut Academy of Arts and Sciences* was incorporated at New Haven in 1799 At first only devoted to matters connected with the State of Connecticut, it now embraces the whole field of the sciences and useful arts It has issued *Memoirs* (1810-16), and now publishes *Transactions* (1866, &c) One of the leading societies in the United States, the *Academy of Natural Sciences* of Philadelphia, founded in 1812 and incorporated in 1817, possesses the best natural history library (35,000 vols) in the country and one of the largest natural history museums in the world, being especially rich in conchology It issues a *Journal* (1817, &c) and *Proceedings* (1843, &c) The *American Entomological Society* is merged with it The *Franklin Institute* of the same city, incorporated in 1824, possesses a library, gives lectures, and issues a *Journal* (1826, &c) The *Boston Society of Natural History* was founded upon the *Linnean Society* (1814) in 1830 and incorporated in 1831 It possesses a library and a cabinet of specimens It published the *Boston Journal of Natural History* (8vo, 1837 63), followed by *Memoirs* (4to, 1866, &c) *Proceedings* (1844, &c) are also issued The *Lyceum of Natural History*, New York, was incorporated in 1817 and has published *Annals* from 1823 (1824, &c) and *Proceedings* (1870, &c) In 1876 the name was changed to *New York Academy of Sciences* A number of American naturalists and geologists, having held meetings in various cities between 1840 and 1847, resolved themselves at their Boston congress in the latter year into the *American Association for the Advancement of Science*, which was incorporated in 1874 Its object is "by periodical and migratory meetings to promote intercourse between American scientists" It has published *Proceedings* (1849, &c) The *National Academy of Science* was incorporated at Washington in 1863 with a view to making the knowledge of specialists available for the service of Government There are two classes of members, those in mathematics and physics and those in natural history It has issued *Annuals* (Cambridge, 1865, &c) and *Reports*, as well as *Memoirs* (1866, &c) The *Academies of Sciences* at San Francisco (1853), St Louis (1856, incorporated 1857), Chicago (1857, incorporated 1865), and Davenport (1867) deserve special mention

Among the remaining societies of a general scientific character are—*Albany Inst* (1828), *Trans* (1830, &c), *Proc* (1870, &c) Ann Arbor, *Sc Assoc* (1875) Baltimore, *Maryland Acad of Sc and Lit*, *Trans* (1837) Buffalo, *Soc of Nat Sc* (1861), *Bulletin* (1873, &c) Charleston, *Elliot Soc of Nat Hist* (1853), *Proc* (1855, &c), *Journal* (4to, 1859, &c) Cincinnati, *Soc of Nat Hist* (1870), *Proc* (1876, &c) Cleveland, *Acad of Nat Sc* (1852), *Annals* and *Proc* Dubuque, *Iowa Inst of Sc and Arts*, *Trans* Indianapolis, *Acad of Sc*, *Trans* (1872, &c) Madison, *Wisconsin Acad of Sciences, Arts, and Letters* (1870), *Bulletin* (1870, &c), *Trans* (1872, &c) Minneapolis, *Minnesota Acad of Nat Sc* (1873), *Bulletin* New Orleans, *Acad of Sc* (1853), *Proc* Portland (Maine), *Soc of Nat Hist* (1850), *Proc* (1862, &c) Poughkeepsie, *Soc of Nat Hist* (1874), *Proc* (1874, &c, 1876, &c) Rochester, *Acad of Nat Sc* (1881) Salem (Mass), *Essex County Nat Hist Soc* (1833, now merged in the *Essex Institute*), published the *American Naturalist* (1867 68), afterwards issued by the *Peabody Acad of Science*, as well as *Proc* (1856, &c) and *Bulletin* (1869, &c) Topeka, *Kansas Acad of Sc* (1867), holds meetings in various cities, *Trans* (1872, &c)

France —The *Institut de France* (see Institute of France), which includes five separate academies, stands at the head of all French societies The *Société Philotechnique*, founded in 1795 and recognized as of public usefulness by a decree of 11th May 1861, has for its object the encouragement and study of literature, science, and the fine arts Two public meetings are held annually The *Annuaire* (1840, &c) is its literary organ The *Société d'Encouragement pour l'Industrie Nationale* was founded in 1801 for the amelioration of all branches of French industry, and was recognized by the state in 1824 Prizes and medals are offered It publishes a *Bulletin* The *Académie Nationale, Agricole, Manufacturière, Commerciale* was founded by the duc de Montmorency in 1830, and also offers prizes and medals, and brings out a *Bulletin* (1830, &c) The *Association Française pour l'Avancement des Sciences* (1871), founded on the model of the British Association, holds migratory meetings and publishes *Comptes Rendus* The scientific congresses whose origin was due to the initiation of M A de Caumont have been noticed at the beginning of the article

The departmental societies are very numerous and active The chief are the following Abbeville, *Soc d'Émulation* (1797), *Mem* (1797, &c) Agen, *Soc d'Agr, Sc, et Arts* (1784), *Recueil* (1804, &c) Aix, *Acad des Sc, &c* (1829), based on *Soc des Amis de la Sc* (1808), *Mem* (1819, &c) Alais, *Soc Sc et Litt* (1868), *Bull* (1868, &c) Amiens, *Acad*, based on *Soc Litt* (1746), *Mem* (1835, &c), *Soc Linnéenne* (1838), *Mem* (1866, &c) Angers, *Soc Acad de Maine et Loire* (1857), *Mem* (1857, &c), *Soc d'Agr, &c* (1818), *Mem* (1831, &c), *Soc Linn de M et L* (1852), *Annales* (1853, &c) Angouleme, *Soc d'Agr, &c, de la Charente* (1803), *Annales* (1819, &c) Annecy, *Soc Florimontane* (1851), *Annales* (1851, &c) and *Rev Savoisienne* (1860, &c) Apt, *Soc Litt, Sc, et Art* (1863), *Annales* (1865, &c) Arras, *Acad* (1738), *Mem* (1818, &c) and other publications Autun, *Soc Éduenne* (1836), *Mem* (1837, &c) and other publications Auxerre, *Soc des Sc* (1847), *Bull* (1847, &c) Bar-le Duc, *Soc des Lettres, &c* (1870), *Mem* (1871, &c) Beauvais, *Soc Acad* (1847), *Mém* (1847, &c) Besançon, *Acad des Sc, &c* (1752, suppressed in 1793, re-established 1805), *Séances publ* (1806, &c), *Soc d'Émulation* (1840), *Mem* (1841, &c) Béziers, *Soc Arch, Sc, &c* (1834),

Bull (1836, &c) Blois, *Soc des Sc et Lettres de Loir et Cher* (1832), *Mem* (1833, &c) Bordeaux, *Acad* (1712, suppressed 1793, re established 1816), *Actes* (1839, &c), *Soc Linn* (1818), *Bull* (1826 29) and *Actes* (1838, &c), *Soc des Sc* (1850), *Mem* (1855, &c) Boulogne, *Soc Acad* (1863), *Mem* (1864, &c) Bourg, *Soc d Émulation* (1783), *Comptes R* (1802 22) and *Annales* (1868, &c) Bourges, *Soc Hist, &c, du Cher* (1849), *Mem* (1857, &c) Caen, *Acad Nat* (1652), *Mem* (1754 60 and 1822, &c), *Soc Linn* (1823), *Mem* (1824, &c), and *Bull* (1855, &c) Cambrai, *Soc d Émulation* (1804), *Mem* (1808, &c) Cannes, *Soc des Sc* (1868), *Mem* (1869, &c) Chambery, *Acad* (1819), *Mem* (1825, &c) Chateaudun, *Soc Dunoise* (1864), *Bull* (1864, &c) Cherbourg, *Soc Acad* (1755), *Mem* (1833, &c), *Soc Nat* (1851), *Mem* (1852, &c) Clermont Ferrand, *Acad* (1747), *Annales* (1828, &c) and *Mem* (1859, &c) Dijon, *Acad* (1740, suppressed 1793, re established 1800), *Mem* (1769, &c) Douai, *Soc d Agr, &c, du Dep du Nord* (1799), *Mem* (1826, &c) Draguinan, *Soc d'Études Sc* (1855), *Bull* (1856, &c) Dunkirk, *Soc Dunkerquoise* (1851), *Mem* (1853, &c) Épinal, *Soc d'Émulation* (1825), *Annales* (1831, &c) Évreux, *Soc Libre d Agr, &c* (1807), *Recueil* (1830, &c) Grenoble, *Acad Delphinale* (1789), based on *Soc Litt* (1772), *Bull* (1846, &c) Laon, *Soc Acad* (1850), *Bull* (1852, &c) La Rochelle, *Acad* (1732, suppressed 1791, reconstituted in 1803 as *Lycee Rochelais* and in 1853 under its former name), *Annales* (1854, &c) Le Havre, *Soc des Sc et Arts* (1868), *Bull* (1868, &c) Le Mans, *Soc d Agr, &c, de la Sarthe* (founded in 1761, reorganized on several occasions, and finally in 1839), *Bull* (1833, &c) Le Puy, *Soc d Agr, Sc, &c* (1819), *Annales* (1826, &c) and *Bull* (1836, &c) Lille, *Soc des Sc, &c* (founded 1802 as *Soc d'Amateurs*), *Mem* (1819, &c) Limoges, *Soc d'Agr, Sc, &c, de la Haute-Vienne* (1759), *Bull* (1822, &c) Lons-le Saunier, *Soc d Émulation du Jura* (1817), *Mem* (1818, &c) Lyons, *Acad* (1700), *Mem* (1845, &c), *Soc d'Agr, Hist Nat, &c* (1761), *Comptes R* (1806, &c) and *Mem* (1838, &c), *Soc Linn* (1822), *Annales* (1836, &c) Macon, *Acad* (1805), *Comptes R* (1818 47) and *Annales* (1853, &c) Marseilles, *Acad* (1726, in 1766 called *Soc des Sciences*, suppressed in 1793, reorganized in 1799, and finally in 1802), *Recueil* (1727 86) and *Mem* (1803, &c) Meaux, *Soc Libre d Agr, Sc, &c* (1798, reorganized in 1820), *Publ* (1833, &c) Mende, *Soc d Agr, &c, du Dep de la Lozère* (1819), *Mem* (1827, &c) and *Bull* (1850, &c) Montbeliard, *Soc d Ém* (1852), *Mem* (1852, &c) Montpellier, *Acad* (founded in 1706 as *Soc Royale*, suppressed in 1793, finally reorganized in 1846), *Mém* (1846, &c), *Soc d Horticult, &c, de l Herault* (1860), *Annales* (1860, &c) Moulins, *Soc d Ém de l'Allier* (1846), *Mem et Bull* (1850, &c) Nancy, *Acad de Stanislas* (1750), *Mem* (1754, &c), *Soc des Sc* (1873), founded on *Soc des Sc Nat de Strasbourg* (1828), *Mem* (1830, &c) and *Bull* (1866, &c) Nantes, *Soc Acad de la Loire Inf* (1848), founded in 1798 as *Institut Departmental*, *Annales* (1830, &c) Nevers, *Soc Nivernaise* (1851), *Bull* (1851, &c) Nice, *Soc des Lettres, &c, des Alpes Marit* (1861), *Annales* (1865, &c) Nimes, *Acad du Gard* (1682), *Mem* Niort, *Soc de Statist Sc, &c, des II MATHEMATICS

Many of the general scientific societies (see class i) have mathematical and other special sections Among defunct English societies may be mentioned the *Mathematical Society*, which used to meet in Spitalfields (1717 1845) and possessed a library, and the *Cambridge Analytical Society*, which published *Memoirs* (4to, 1813) The *London Mathematical Society*, *Proc* (1865, &c), and the *Edinburgh Mathematical Society* (1883), *Proc* (1883, &c), are still flourishing

FRANCE Paris, *Soc Mathém de France* (1872), *Bull* (1873, &c) GERMANY Berlin, *Mathem Ver der Univ* (1861), *Ber* (1876, &c) Cassel, *Geometer-Ver* (1878) Dresden, *Ver praktisch Geometer* (1854), *Jahresber* (1861, &c) Essen, *Feldmesser Ver* (1869) Frankfort, *Phys Ver* (1824) Gottingen, *Mathemat Ver* (1868) Hamburg, *Mathemat Ges* (1690), *Mittheil* Konigsberg, *Geometer-Ver* (1872) Strasburg, *Geometer Ver* (1881) Stuttgart, *Deutscher Geometer Ver, Zeitschrift* (1872, &c) HOLLAND Amsterdam, *Genootschap der Mathemat Wetensch Kunstoefeningen* (1782 88), *Mengelwerken* (1793 1816), and *Archief* (1856, &c) SPAIN Valladolid, *R Acad de Matematicas* (1803, &c), now dissolved RUSSIA Moscow, *Mathemat Soc* JAPAN *Mathemat Soc of Tokio, Journal* (1878, &c)

III Astronomy

Astronomical observatories and their publications have been already treated and enumerated in the article OBSERVATORY The *Royal Astronomical Society* was founded in 1820 under the title of *Astronomical Society of London*, and was incorporated on 7th March 1831 It occupies rooms in Burlington House, and has published *Memoirs* (1822, &c) and *Monthly Notices* (1831, &c) There are also societies at Bristol (1869), *Reports*, Liverpool (1881), and Leipsic, *Astronomische Ges* (1863), *Publ* (1865, &c) and *Vierteljahrsschrift* (1866, &c)

IV Physics

The *Physical Society of London* was founded in 1874 and registered under the Companies Act, it has published *Proceedings* (1874, &c) The *London Electrical Society* (1836), did useful work in its *Transactions* (1837 40, vol 1) and *Proceedings* (1841 43) Sir W Siemens was one of the originators of the *Society of Telegraph Engineers and Electricians*, which was founded in 1871 and registered in 1883 It owns the Ronalds library of electricity and magnetism and publishes a *Journal*

UNITED STATES Chicago, *Amer Electrical Soc*, *Journ* (1875) New York, *National Telegr Union*, *Telegrapher* (1864 70) FRANCE Cambrai, *Soc Magnetique*, *Archives* (1845) Paris, *Soc Franc de Phys* (recognized as of public utility on 15th January 1881), *Bull* GERMANY Berlin, *Physikalische Ges* (1843), *Fortschritte der Physik* (1847, &c), *Elektrotechnisch Ver* (1877), *Ztschr* (1880, &c) Breslau, *Physikalischer Ver* Frankfort, *Physikalischer Ver*, *Jahresber* ITALY Naples, *R Accad delle Sc Fis e Matem*, *Rendic* (1856, &c) and *Atti* (1863) Rome, *Soc degli Spettroscopisti Ital* HOLLAND Rotterdam, *Bataafsch Genootschap van Proefondervindelijke Wijsbegeerte*, *Verhandel* (1774, &c)

V Chemistry

Pharmaceutical societies are placed in class xiii (Medicine, &c) The *Chemical Society of London* for the promotion of chemistry and the sciences immediately connected with it was instituted on 23d February 1841, a charter of incorporation was obtained in 1848 It publishes *Memoirs* (1843, &c) and *Quarterly Journal* (1849, &c) Chemistry and its connexion with the arts, and agricultural and technical matters, form the subjects of the *Institute of Chemistry*, founded on 2d September 1877 and incorporated on 2d October 1877 The *Society of Chemical Industry* (1881) is specially devoted to the branch of chemical engineers The *Society of Public Analysts* publishes the *Analyst* (1876, &c) The oldest of the numerous photographic societies is the *Photographic Society of Great Britain* (1853) which issues a *Journal* The *Royal College of Chemistry* was founded in July 1845, and had a brief career, it published *Reports* (1849) The *Cavendish Society* was instituted in 1846 for the publication and translation of works and papers on chemistry It came to an end in 1872 after having issued 30 vols

UNITED STATES New York, *American Chemical Soc* (1876), *Proc* (1876) and *Journ* (1879, &c) FRANCE Paris, *Soc Chimique*, *Bull* (1858, &c) GERMANY Berlin, *Deutsche Chemische Ges* (1867), *Ber* (1868, &c) Frankfort, *Chem Ges* Jena, *Chem Laborat* Wurzburg, *Chemische Ges* (1872) BOHEMIA Prague, *Spolek Chemiku Ceskych* or *Soc of Bohemian Chemists*, *Zpravy* or *Trans* (1872, &c) RUSSIA St Petersburg, *Russ Chem and Phys Soc at Univ*, *Journal* (1869, &c)

VI Geology, Mineralogy, and Palæontology

Among these the *Geological Society of London*, founded in 1807 and incorporated in 1826, is the largest and most important, it has published *Proceedings* (1834 46), *Transactions* (1811, &c), and a *Quarterly Journal* (1845, &c) The *Geologists' Association* was instituted in 1858, and issues *Proceedings* (1859, &c) The *Mineralogical Society* (1876) has united with it the *Crystallogical Society*, it issues the *Mineralogical Magazine* (1876, &c) The *Palæontographical Society* was founded in 1847 for the delineation and description of British fossils, it issues *Publications* (39 vols 4to, 1847, &c) The *Cornwall Royal Geological Society* (1814) devotes special attention to the mining interests of the county, and publishes *Transactions* (1818, &c) It holds its meetings at Penzance In Scotland there are the *Geological Society of Edinburgh* (1834), which has *Transactions* (1870, &c), and the *Glasgow Geological Society* (1858), which also has *Transactions* (1860, &c) The *Royal Geological Society of Ireland* (1832) is chiefly directed to the geology of the country It publishes a *Journal* (1837, &c) There are also the *Geological Associations* of Leeds (1874) and Liverpool (1880), *Trans*, the *Societies* of Liverpool (1859), *Proc*, Manchester (1838), *Trans*, and Norwich (1864), *Proc*, and the *Yorkshire Geological and Technological Society*, *Proc* (1839, &c)

UNITED STATES Louisville, Ky, *Ohio Falls Geolog Soc* San Francisco, *California State Geolog Soc* (1876) FRANCE Lille, *Soc Geol du Nord* (1870), *Annales* (1874, &c) Havre, *Soc Geol de Normandie*, *Bull* (1873, &c) Paris, *Soc Geol de France* (1830, recognized 1832), awards the Prix Viquesnel (£40) every three years, *Bull* (1830, &c) and *Mem* (1833, &c), *Soc Franç de Mineralogie* (recognized 1886), formerly *Soc Mineral de France*, *Bull* Saint-Étienne, *Soc d'Ind Minérale* (1855), *Bull* (1855, &c) GERMANY and AUSTRIA HUNGARY Berlin, *Deutsche Geol Ges* (1848), *Ztschr* (1849, &c) Brunn, *Wernerscher Geol Ver*, *Jahresber* Darmstadt, *Mittelrheinischer Geol Ver* (1851), *Mittheil* (1855, &c) Dresden, *Gebirgs-Ver* (1855) Pesth, *Geol Ver f Ungarn* SWITZERLAND *Schweizerische Geol Ges* (1882), section of *Allg Schw Ges* Zurich, *Schweiz Palaontol Ges* (1874), *Abhandl* (1875, &c) ITALY *Soc Geol Ital*, founded at the second International Geological Congress BELGIUM Antwerp, *Soc Paleontol* (1857), *Bull* Charleroi, *Soc Paléontol* (1863), *Documents et Rapports* (1866, &c) Liége, *Soc Geol de Belgique*, *Annales* (1874, &c) SWEDEN Stockholm, *Geologiska Forening*, *Forhandlingar* (1872, &c) RUSSIA St Petersburg, *Imp Russian Mineralog Soc*, *Trans* (1830, &c) ARGENTINE REPUBLIC Buenos Ayres, *Soc Paleontol*

VII Meteorology

The *International Meteorological Congress* first met at Vienna in 1873 The *Royal Meteorological Society* (1850) of London was incorporated in 1866, its organ is *Quarterly Journal* (1873, &c) To this must be added the *British Rainfall Society* and the *Scottish Meteorological Society*, which holds its meetings at Edinburgh and issues a *Journal* (1866, &c) Port Louis (Mauritius), *Meteorolog Soc*, *Trans* (1853, &c) Paris, *Soc Météorolog de France*, *Annuaire* (1849, &c) and *Nouvelles Meteorolog* (1868, &c) Hamburg, *Deutsche Meteorolog Ges* (1883), *Ztschr* Magdeburg, *Ver f landwirthsch Wetterkunde* (1881) Meissen, *Gesellsch Isis* Vienna, *Oesterreich Ges f Meteorol*, *Zeitschrift* (1866, &c) Modena, *Soc Meteorolog Ital*

VIII Microscopy

The *Royal Microscopical Society* (1839, incorporated 1866), with *Transactions* (1842 68) and *Journal* (1869, &c), the *Quekett Microscopical Club* (1865), with a *Journal* (1868, &c), and the *Postal Microscopic Society* (1873), also with a *Journal*, are located in London There are suburban societies at Ealing (1877), Hackney (1877), Highbury (1878), South London (1871), and Sydenham (1871) Amongst those in the provinces may be mentioned the ones at Bath (1859), Birmingham (1880), Bolton (1877), Bradford (1882), Bristol (1843), Carlisle, Chichester (*Trans*), Croydon (1870, *Trans*), Dublin (1840), East Kent (1858), Liverpool (1868, *Trans*), Manchester (1880), New Cross (1872), and Sheffield (1877) In the United States the *State Microscop Soc of Illinois* publishes the *Lens* (1872, &c), Buffalo, *Amer Soc of Microscopists*, New York, *Microscop Soc* Brussels, *Soc Belge de Microscop* (1875), *Proc -Verb* (1875, &c) and *Annales* (1876, &c) Berlin, *Ges f Mikroskop* (1877), *Ztschr* (1878, &c) Hanover, *Ges f Mikroskop* (1879), *Jahresber*

IX Botany and Horticulture

Linnæan societies, which usually deal with both zoology and botany, are placed in the general class (No 1) The *Congres International d'Horticulture* first met at Brussels in 1864 and the *Congres International de Botanique* at Amsterdam in 1865 The *Royal Botanic Society of London* (incorporated 1839) has gardens in the inner circle of Regent's Park, and issues a *Quarterly Record* (1880, &c) The *Royal Horticultural Society* (established in 1804, incorporated in 1809) has gardens at Chiswick, and publishes a *Journal* (1846, &c) The chief provincial societies are—Aberdeen, *North of Scott Hortic Assoc* (1879), *Trans* Arbroath, *Hortic Assoc* (1880) Birmingham, *Bot and Hortic Soc* (1830), gardens Dublin, *Roy Hortic Soc* (1830) Edinburgh, *Bot Soc* (1836), *Proc* (1837, &c) and *Trans* (1844, &c), *Scottish Arboric Soc* (1854), *Trans*, *Cryptogamic Soc of Scotl* (1875) CANADA Kingston, *Bot Soc of Canada* (1860), *Annals* (1861, &c)

UNITED STATES Boston, *Hortic Soc* (1829) New York, *Torrey Botanical Club*, *Bull* (1870, &c) San Francisco, *State Hortic Soc* FRANCE Beauvais, *Soc d'Hortic et de Bot* (1864), *Bull* (1864, &c) Bordeaux, *Soc d'Hortic* Chartres, *Soc d'Hortic et de Viticulture* Chauny, *Soc de Pomologie* Dijon, *Soc d'Hortic* Fontenay le Comte, *Soc d'Hortic* Lisieux, *Soc d'Hortic et de Lot* (1866), *Bull* (1866, &c) Lyons, *Soc d'Hortic Pratique* (1844), *Bull* (1844, &c), *Soc Bot* (1872), *Annales* (1872, &c), *Soc Pomologique* (1872), *Bull* (1872, &c) Moulins, *Soc d'Hortic* Nimes, *Soc d'Hortic* Niort, *Soc d'Hortic* Orleans, *Soc d'Hortic* (1839), *Bull* (1841, &c) Paris, *Soc Nat d'Hortic* (1827, declared of public utility 1852), *Journal*, *Soc Bot de France*, *Bull* (1854, &c) Rouen, *Soc Centr d'Hortic* Saint Germain en Laye, *Soc d'Hortic* Senlis, *Soc d'Hortic* Troyes, *Soc d'Hortic* Versailles, *Soc d'Hortic* GERMANY and AUSTRIA HUNGARY Berlin, *Bot Ver* (1859), *Verhandl* (1859, &c), *Deutsche Bot Ges* (1882), *Horticult Ges* Blankenburg, *Bot Ver* Bonn, *Bot Ver* (1818), *Jahresber* (1837, &c) Dresden, *Flora Ges f Bot*, *Mittheil* (1841, &c) Erfurt, *Gartenbau Ver* Frankfort, *Gartenbau Ges* Freiburg, *Bot Ver* Gorlitz, *Gartenbau Ver* Gotha, *Thuringer Gartenbau Ver* Klagenfurt, *Karntnerische Gartenbau Ges* Landshut, *Bot Ver* (1864) Memmingen, *Ver f Pomologie u Gartenbau* Munich, *Baierische Gartenbau Ges* Ratisbon, *K Baierische Bot Ges* (1790), *Flora* (1818, &c) and *Repertorium* (1864, &c) Reutlingen, *Pomolog Inst* Sondershausen, *Bot Ver* Stuttgart, *Gartenbau Ges*, *Flora* Vienna, *K k Gartenbau Ges*, *Botan Ver*, *Verhandl* (1851, &c) Weimar, *Ver f Blumistik* Wurzburg, *Bot Inst*, *Arbeiten* (1871, &c) ITALY Milan, *Soc Crittog Ital*, *Atti* (1878, &c) BELGIUM *Fédération des Soc d'Hortic de Belgique* (1860), *Bull* Antwerp, *Soc Roy d'Hortic et d'Agr*, *Soc Phytologique*, *Annales* (1864, &c) Bruges, *Soc d'Hortic et de la Bot* Brussels, *Soc Roy de Bot* (1862), *Bull* (1862, &c), *Soc Roy de Flore*, *Soc Centr d'Arboric*, *Annales* Liege, *Soc Roy d'Hortic* HOLLAND Leyden, *Nederl Bot Vereen* Luxembourg, *Soc de Bot*, *Recueil* (1874, &c) Nimeguen, *Nederl Bot Vereen*, *Archief* (1871, &c) DENMARK Copenhagen, *Bot Forening*, *Tidsskrift* (1866, &c)

X Zoology

Societies dealing with natural history in general, or zoology and botany together, are arranged under class 1 The *Zoological Society of London* (founded 1826, incorporated 1829) is famous for its collection of live animals in its gardens at Regent's Park It publishes *Proceedings* (8vo, 1830, &c) and *Transactions* (4to, 1835, &c) The other metropolitan societies are—*British Ornithologists Union* (1859), *Entomological Society of London* (1833), *Trans* (1834, &c), *National Fish Culture Association* (1883) The *Marine Biological Association of Great Britain* (1884), for the study of marine food fishes and shell-fish, has a laboratory at Plymouth The *Royal Zoological Society of Ireland* (1831) has gardens in the Phœnix Park There is the British *Beekeepers Association* (1874) AUSTRALIA and NEW ZEALAND Auckland, *Acclimatisation Soc* Brisbane, *Acclimat Soc* Christchurch, *Acclimat Soc* Melbourne, *Zoolog and Acclimat Soc of Victoria*, *Report* (1861, &c) Sydney, *Acclimat Soc of N S Wales*, *Report* (1862, &c), *Entomolog Soc of N S W*, *Trans* (1863, &c) Wellington, *Westland Nat and Acclimat Soc* AFRICA Cape Town, *Zoolog Soc* Port Louis (Mauritius), *Soc d'Acclimat* CANADA Toronto, *Entomolog Soc*, *Beekeepers' Assoc*

UNITED STATES Cambridge, *Nuttall Ornitholog Club*, *Quart Bull* (1876, &c), and *Entomolog Club*, *Psyche* (1874, &c) Cincinnati, *Zoolog Soc* (1874), *Report* (1875, &c) *Illinois Central Beekeepers' Association* Philadelphia, *Zoolog Soc* (1873), *Report* (1874, &c), and *Amer Entomolog Soc*, merged in the *Acad of Nat Sc* Washington, *Biolog Soc*, and *Entomolog Soc* FRANCE Alais, *Soc Sericicole*, *Bull* (1876, &c) Amiens, *Soc d'Apiculture*, *Bull* (1875, &c) Clermont, *Soc Centr d'Apicult*, *Bull* (1875, &c) Lille, *Inst Zoolog a Wimereux*, *Travaux* (1877, &c) Paris, *Soc Nat d'Acclimat* (1854), *Bull Mensuel* (1854, &c) and *Chron Bimens* (1875, &c), *Soc Zoolog de France*, *Bull* (1876, &c), *Soc Entomolog de France*, and *Soc de Biologie*, *Comptes Rendus* (1850, &c) GERMANY and AUSTRIA HUNGARY *Wanderversammlung Deutscher Bienenzuchter*, *Verhandl* (1856, &c) Bendorf, *Akklimat -Ver* Berlin, *Akklimat Ver* (1856), *Zeitschr* (1858, &c), *Central Inst f Akklimat*, *Mittheil* (1859, &c), *Deutsche Zoolog Ges*, *Deutsche Ornithologen Ges* (1845), *Ber* (1850, &c), *Deutsche Fischerei Ver*, *Publikat* (1871, &c), *Deutsche Entomolog Ges* (1856), *Entomolog Zeitschr* (1857, &c), *Ver zum Beford des Seidenbaues*, *Jahresber* (1869, &c), *Physiolog Ges*, *Verhandl* (1877, &c) Breslau, *Physiolog Inst*, *Studien* (1861, &c), *Ver f Schles Insektenkunde*, *Zeitschr* (1847, &c) Brunswick, *Deutsche Ornitholog Ges* Carlsruhe, *Badischer Ver f Geflugelzucht*, *Monatsblatt* (1872, &c) Frankenberg, *Bienenwirthschaftl Haupt Ver*, *Sachs Bienenfreund* (1865, &c) Frankfort, *Zoolog Ges*, *Der Zoolog Garten* (1860, &c), *Deutsche Malakozoolog Ges*, *Jahrbuch* (1874, &c) and *Nachrichtsblatt* (1869, &c) Halberstadt, *Deutsche Ornitholog Ges*, Halle, *Ornitholog Central Ver* Hamburg, *Zoolog Ges*, *Ber* (1862, &c) Hanover, *Bienenwirthschaftl Central-Ver*, *Centralblatt* (1865, &c) Leipsic, *Sachs Seidenbau Ver*, *Zeitschr* (1868, &c) Munich, *Entomolog Ver* (1876), *Fischerei Ver*, *Mittheil* (1876, &c) Nordlingen, *Ver Deutscher Bienenwirthe*, *B -Zeitung* (1845, &c) Ratisbon, *Zoolog -Mineralog Ver* (see class 1) Stettin, *Ornitholog Ver* (1873), *Jahresber* (1873, &c), *Entomolog Ver* (1837), *Ent Zeitung* (1840, &c) Triest, *Zoolog Inst u Zoolog Station*, *Arbeiten* (1878, &c) Troppau, *Schles Bienenzucht Ver* (1873) Vienna, *Entomolog Ver*, *Embryolog Inst*, *Mittheil* (1871, &c), *Ornitholog Ver* Wurzburg, *Zoolog -Zootomisches Inst* (1872), *Arbeiten* (1874, &c) SWITZERLAND Bern, *Schweiz Entomolog Ges* Geneva, *Assoc Zoolog du Leman*, *Soc Ornitholog Suisse* (1865), *Bull* (1866, &c) ITALY Casale, *Soc Bacologica*, *Boll* (1866, &c) Florence, *Soc Allantina Ital*, *La Sericicultura* (1865, &c), *Soc Entomolog Ital*, *Bull* (1869, &c) Naples, *Zoolog Station*, *Mittheil* (1878) Palermo, *Soc di Acclimaz*, *Atti* (1861, &c) Pisa, *Soc Malacolog Ital*, *Bull* (1875, &c) Rome, *Soc di Piscicolt Ital* (1872) BELGIUM Antwerp, *Soc Roy de Zoologie* Brussels, *Soc Roy de Zoologie*, *Soc Entomolog de Belgique* (1855), *Annales* and *Bull* (1857, &c), *Soc Malacolog* (1863), *Annales* (1863, &c) and *Proces Verb* (1872, &c) HOLLAND Amsterdam, *K Zoolog Genootschap "Natura Artis Magistra,"* *Jaarboekje* (1852, &c) and *Tijdschr* (1863, &c) The Hague, *Nederl Entomolog Vereen*, *Tijdschr* (1857, &c) Rotterdam, *Nederl Dierkundige Vereen*, *Tijdschr* (1874, &c) NORWAY Bergen, *Selskabet for Norges Fiskeriers* SWEDEN Stockholm, *Entomolog Forening* RUSSIA Moscow, *Acclimat Soc* St Petersburg, *Russian Entomolog Soc* ARGENTINE REPUBLIC Buenos Ayres, *Soc Zoolog Argentina*, *Period Zoolog* (1875, &c), *Soc Entomolog Argent*

XI Anthropology

The *Congrès International d'Anthropologie et d'Archéologie Préhistoriques* held its first meeting at Neuchatel in 1866, it issues *Comptes Rendus* (1866, &c) The *Anthropological Institute of Great Britain and Ireland* was founded in 1871 upon the *Ethnological Society* (1843), which published a *Journal* (1848 56) and *Transactions* (1859 69), and the *Anthropological Society* (1863), which issued *Memoirs* (1863 69) and the *Anthropological Review* (1864-70) The *Institute* brings out a *Journal* (1871, &c)

United States Ashtabula *Anthropolog Soc* New York, *Amer Ethnolog Soc*, *Trans* (1845 53) and *Bull* (1860 61), *Anthropolog Inst*, *Journ* (1871, &c) Washington, *Anthropolog Soc* France Paris, *Soc d'Anthropologie* (1859, recognized 1864), *Bull* and *Mem* (1860, &c), *Soc d'Ethnogr*, *Annuaire* (1862, &c) and *Revue* (1869, &c), *Soc des Traditions Populaires* (1886), *Revue* Germany and Austria Hungary Berlin, *Ges f Anthropologie*, &c (1869), *Ztschr* (1870, &c) and *Verhandl* (1871, &c) Brunswick, *Deutsche Ges f Anthropologie*, *Archiv* (1870, &c) and *Corr-Blatt* (1874, &c) Gottingen, *Anthropolog Ver*, *Mittheil* (1874, &c) Leipsic, *Ver f Anthropolog*, *Ber* (1871, &c), afterwards joined to the *Ver der Erdk* Munich, *Ges f Anthropolog* (1870), *Beitr* (1876, &c) Stuttgart, *Anthropolog Ges* Vienna, *Anthropolog Ges*, *Mittheil* (1870, &c) Italy Florence, *Soc Ital di Antropologia*, *Archivio* (1873, &c) Sweden Stockholm, *Antropologiska Sallskapet*, *Tidskr* (1875, &c) Spain Madrid, *Soc Antropolog Esp*, *Revista* (1875, &c) Havana (Cuba), *Soc Antropolog* Russia *Imp Soc for Friends of Research in Nat Sc*, *Anthropology*, &c

XII Sociology (Economic Science, Statistics, Law Education)

The international societies are the *Association Internationale pour le Progrès des Sciences Sociales* and the *Congrès International de Statistique*, which first met at Brussels in 1853 Both have issued *Comptes Rendus* The *Congrès International de Bienfaisance* may be traced to a suggestion at the *Congrès Pénitentiaire* held at Frankfort in 1847 The first meeting took place at Brussels in 1856 The *National Association for the Promotion of Social Science* (1857) had united with it in 1864 the *Society for Promoting the Amendment of the Law* It holds a yearly migratory meeting, and publishes *Transactions* (1858, &c) and *Social Science* (1866, &c) The *Statistical Society* (1834), with a *Journal* (1839, &c), *Political Economy Club* (1821), *Cobden Club* (1866), for the diffusion of the political and economical principles with which Cobden's name is associated, having various publications, *Institute of Actuaries*, *Institute of Chartered Accountants* (1880), and the *Institute of Bankers* (1879) meet in London There are also the *Manchester Statistical Society* (1833), with *Transactions*, the *Actuarial Society of Edinburgh* (1859) and the *Social and Statistical Society of Ireland* (1847), with a *Journal*, at Dublin After the Inns of Court (*q v*), the most important of English legal societies is the *Incorporated Law Society of the United Kingdom* (1827, incorporated 1831), it began courses of lectures for students in 1833, and was appointed registrar of solicitors ten years later, and obtained supplementary charters in 1845 and 1878, it has fifty provincial law societies in association The *Verulam Society* (1846) published a few books and came to an end The *Selden Society* for the promotion of the study of the history of law was established in 1887 The headquarters of the *Association for the Reform and Codification of the Law of Nations* are in London, but conferences are held in various Continental towns The *Institute of Patent Agents* (incorporated 1882) issues *Transactions* The *Juridical Society of Edinburgh* (1773) has published five editions of a *Complete System of Conveyancing* The *Ascham Society* was founded in 1879 for the improvement of educational methods, and the *Society for the Development of the Science of Education* (1875) issues *Transactions*

United States Boston, *Amer Assoc for Promotion of Soc Sc*, *Amer Statist Assoc*, *Collections* (1847, &c) New York, *Soc for Polit Education*, *Publ* France Grenoble, *Soc de Statist* (1838), *Bull* (1840, &c) Marseilles, *Soc de Statist* (1827), *Repertoire* (1837, &c) Paris, *Soc Int des Études Pratiques d'Écon* (1856, recognized 1869), *La Réforme Soc*, *Soc Fran de Statist Univ* (1829), *Journal* issued jointly with *Acad Nat* since 1849, *Soc de Statist de Paris* (1860, recognized 1869), *Journ* (1860, &c), *Soc de Legislation Comparée* (1869 recognized 1873), *Bull*, *Annuaire de Leg Franç*, and *Ann de Leg Étran*, *Soc pour l'Instr Élément* (1815, recognized 1831), *Bull* St Maixent, *Soc de Statist des Deux-Sèvres* Germany Berlin, *Volkswirths Ges* (1860), *Volkswirths Zeitfragen* (1879, &c), *Ver f deutsche Volkswirths* (1876), *Ztschr* (1880, &c), *Ver f Förderung d Handelsfreiheit* (1878), *Mittheil* (1879, &c), *Ver f d Statist*, *Jurist Ges* (1859), *Jahresber* (1863, &c) Dresden, *Statistischer Ver* (1831), *Mittheil* Frankfort, *Statistische Ges*, *Juristische Ges* (1866), *Rundschau* (1867, &c) Lübeck, *Jurist Ges* Leipsic, *Ver f wiss Pädagogik*, *Jahrbuch* and *Mittheil* Belgium Brussels, *Ligue de l'Enseignement* (1864), *Bull*, *Soc Centr des Instituteurs Belges* (1860), *Le Progrès* Holland Amsterdam, *Ver voor de Statist in Nederland*, *Jaarboekje* (1849, &c) and *Jaarcijfers* (1882, &c) Spain Madrid, *Junta Estadist* Russia Moscow, *Juridical Soc* St Petersburg, *Pedagogical Soc* Egypt Cairo, *Bureau Central de Statist* Japan Tokio, *Statist Soc*

XIII Medicine, Surgery, &c

The first meeting of the *Congrès Médical International* was held at Paris in 1867, a *Bulletin* has been issued annually since 1868 The *Proceedings of the British National Veterinary Congress* date from 1881 The Royal Colleges of Physicians and of Surgeons of London, Edinburgh, and Dublin do not come within our scope The *Medical Society of London* (1773) is the oldest in the metropolis, it has issued *Memoirs* (1787 1805), *Transactions* (1810, &c), and *Proceedings* (1872, &c) The other London societies include the *Abernethian Society* (1795), which issues *Proceedings*, *British Dental Association* (1879), with a *Journal* (1880, &c), *British Gynæcological Society* (1884), *British Homœopathic Association* (1859), with *Annals* (1860, &c), *British Medical Association* (1832), which has more than forty home and colonial branches, and publishes *British Medical Journal* (1857, &c), *Clinical Society* (1867), with *Transactions*, *Dermatological Society* (1882) *Epidemiological Society* (1850), with *Transactions* (1855, &c), *Hahnemann Publishing Society* (1852), *Materia Medica* (1852, &c), *Harveian Society* (1831), *Homœopathic Association* (1845), *Hunterian Society* (1819), *New Sydenham Society* (1858), which publishes *Biennial Retrospect* (1867, &c), and translations and reprints of books and papers of value, succeeded the *Old Sydenham Society* (1844 57), which issued 40 vols, *Obstetrical Society* (1858), with *Transactions* (1860, &c), *Odontological Society* (1856), with *Transactions* (1858, &c) *Ophthalmological Society* (1880), *Parkes Museum* (1876), founded in memory of the services of Dr E A Parkes to sanitary science, *Pathological Society* (1846) *Transactions*, *Pharmaceutical Society* (1841), with museum, which has a branch at Edinburgh, *Pharmaceutical Journal* (1842, &c), *Physiological Association* (1876), *Journ of Physiology* (1878, &c), *Royal Medical and Chirurgical Society* (1805, charter 1834), with library, and *Transactions* (1809, &c) and *Proceedings* (1857, &c), *Sanitary Institute* (1876), the council of which appoint examiners, *Society of Medical Officers of Health* (1856), *Transactions* The provincial societies are very numerous and include—Birmingham, *Midland Med Soc* (1848) Dublin, *Acad of Med in Ireland* (1882), *Trans* (1883, &c) Edinburgh, *Roy Med Soc* (1737, charter 1778), *Harveian Soc* (1752), *Medico Chirurg Soc* (1821), *Trans* (1824, &c), and *Obstetrical Soc* (1840) Glasgow, *Medico Chirurg Soc* (1866), based upon *Med Soc* and *Med-Chirurg Soc* (both 1814) Manchester, *Med Soc* (1834)

Australia Melbourne, *Med Soc of Victoria*, *Austr Med Journ* (1856, &c) Canada Montreal, *Union Méd du Canada*, *Revue* (1872, &c), *Canada Med Assoc*, *Trans* (1877, &c) India Bombay, *Med and Physical Soc*, *Trans* (1838, &c) Calcutta, *Med Soc*, *Trans* (1883, &c)
